Emotional instability capricious appètite, restless sleep and disturbance in the habit of evacuation and urination form part of the syn drome of mild rhoumatic carditis Marked and frequent fluctuations of expressions of elation and depression are obvious manifestations during this phase of the disease.

The pallor of rheamate active disease during the acute stage is well known. This is often far and above what one would expect from the level of the hemoglobin. The discrepancy between the degree of pallor and the level of the hemoglobin continues during the entire active rheumatic process. A close parallelism exists between the degree of pallor and fatigability. Afternoon and evening pallor is of greater intensity than that noted after a night's rest Increase in physical exertion or emotional disturbance accentuates the pallor after the initial increase in coloring following exertion.

These manifestations are a definite part of the general picture which is presented by the patient who is suffering from mild rheumatic activity As long as the patient presents these manifestations, rheumatic active disease must be suspected

Auscultatory Evidence -The cardiac rate in this group of children may be rapid or slow, but always markedly labile Stimuli, which in quescent hearts do not disturb the cardiac rate. cause, in this group, marked fluctuations Furthermore, this fluctuation is longstanding Physical exertion and emotional disturbance produce a sinus tachycardia of the tic tac type, lasting several hours Continued bedrest may slow the heart rate to the average normal, only to be markedly accelerated when bedrest is terminated When, however, active carditis has subsided this disturbance in cardiac rate is of distinctly lesser degree and of markedly shorter duration In a quiescent heart, the return to normal of the accelerated heart rate is measured in terms of minutes, in active carditis, it is measured in terms of hours and, not infrequently, in terms of days

Cardiac sounds and murmurs in mild carditis are over changing. The volume and pitch of both first and second heart sounds vary from day to day and often from beat to beat. Murmurs change in quality, direction, and extent of transmission. The evanescent character of cardiac murmurs in rheumatic hearts is well known. The frequency and multiplicity of changes observed in this group of children is noted only in the actively inflamed hearts. It would seem that the cardiodynamics responsible for cardiac sounds and murmurs is in a state of flux in the active heart, and stabilizes only when the heart becomes quiescent.

The cardiac rhythm in active carditis simulates; that of an embryocardia, irrespective of the rate. The normal ratio of the duration of systole and duastole is definitely disturbed. On auscultation

المرابع المرابع

it would seem that the time interval between the first and second heart sounds is longer than the interval between the second and first sounds It is well known that during exercises the diastolic period is foreshortened to a greater degree than the systolic period, but the sinus tachycardia following exercises or during fever is distinct from the embryocardia type of rhythm noted in carditis And this type of rhythm is not modified by cardiac rate, as long as carditis continues Occasionally, a sinus bradycardia with a one to one rhythm is observed in active Since it is well known that the duration of mechanic and electric systole are for practical purposes equal, it was possible to substantiate our observations by electrocardiographic measurements

A fuller description of these observations has been presented for publication (See Taran, L M, and Szilagyi, N Am Heart J 33 14 (Jan)

As rheumatic activity subsides, the disturbance in rhythm gradually returns to normal restoration period to the normal ratio is slow and unstable In complete physical and emotional rest, the patient, who is definitely approaching quiescence, shows short periods of normal cardiac rhythm Diastole becomes relatively longer These periods of normal rhythm are punctuated by intervals of the tic-tac variety of rhythm At this stage, physical exertion or emotional disturbance blots out the periods of normal rhythm and the tumultuous character of the cardiac action is accentuated

The unstable character of the cardiac rate. the evanescent character of sounds and murmurs, and the disturbance in rhythm was noted in all of our cases during the initial phase of the acute In 1 out of every 4 cases, these auscarditis cultatory signs persisted after all laboratory evidence of rheumatic activity had subsided It is of great significance, from the therapeutic standpoint, to note that the group of children showing only auscultatory evidence of carditis, did poorly when permitted to resume normal childhood activities Some showed symptoms of cardiac insufficiency, and a few presented unequivocal evidence of cardiac enlargment after a short period of observation Many children in this group began to show obvious signs of The auscultatory signs of carditis reactivation increased and corroborative laboratory evidence When, however, all auscultabecame manifest tory signs of carditis had definitely subsided, a return to normal physical activity presented no untoward effects and signs of rheumatic reactivation were not observed

Discussion

Dr Philip Rosenblatt, Brooklyn -The report by Dr Taran is particularly valuable since it emphasizes a phase of medicine which seems to be going out of fashion With the discovery of new methods and technics and consequent increased familiarity with the laboratory, there is a tendency for the doctor to place greater reliance upon laboratory reports than upon his clinical judgment

This trend is greatly deplored by most pathologists, since we know that the laboratory should be used for confirmation of clinical impressions and not

merely for diagnosis

Rheumatic fever offers no exception to this maxim There exists as yet no definite test which is diagnostic of the disease, and most students agree that there is a strong possibility that rheumatic fever has not been reproduced in experimental animals recent years, the generalized nature of rheumatic fever has been stressed Extensive changes have been found throughout many organs, but it would seem, from a study of the morbid anatomy, that the supporting or connective tissues of the body show The clinical signs and sympthe greatest change toms are as protean as the anatomic changes and vary in duration and intensity

These factors have been well illustrated by Dr Taran. I do not, however, share his optimism in placing complete reliance upon such observations as auscultatory signs since the failings of the human ear are well known While this might serve very well for an individual here or there, certainly, in the vast majority of cases, this criterion would not prove

I would much rather propose a full evaluation of all the available data, not disregarding even the much maligned sedimentation rate. It should be fully realized that one or even two clinical or laboratory observations might not suffice Only the entire picture, carefully evaluated, should be the criterion of choice in the absence of any single specific diagnostic procedure

TECHNICAL EXHIBITS at the ANNUAL MEETING

PHYSICIANS planning to attend the Annual Meeting of the Medical Society of the State of New York, May 5 to 9, in Buffalo, will want to spend some time viewing the many excellent exhibits arranged for their inspection. The Memorial Auditorium affords ample space for a greatly expanded Scientific Exhibit Section The number of Technical Exhibits, too, has been increased Exhibits will be conveniently located adjacent to meeting rooms

EFFECT OF ULTRAVIOLET AIR STERILIZATION UPON INCIDENCE OF RESPIRATORY INFECTIONS IN A CHILDREN'S INSTITUTION

ASIX YEAR STUDY

REGINALD A HIGGONS MD, and GERTRUDE M HYDE. M.D. Port Chester, New York (From the Pediatric Department of St. Luke & Hospital New York City)

THE epidemic incidence of acute respiratory L infections in children's institutions has always been a serious problem which interferes with optimum results in the children's care, and in creases the necessary length of stay and the per patient day cost In 1937 a survey of this problem and the literature to that date was presented to the Chicago Pediatric Society by Dr. Charles McKhann et al 1

In the children's wing of the Convalescent Branch of St. Luke's Hospital, New York this problem has often been acute (Fig 1) hospital draws the major portion of its patients from the wards and clinics of the parent institu-The types of cases cared for include mildly active and quiescent rheumatic disease mal nutrition tuberculous contacts, childhood type of tuberculosis with no open lesion, orthopedics, emotional adjustment problems postacute med ical and postacute surgical illnesses and one six bed small infant ward. The average yearly admissions total about 300 children with 10 000 to 12 000 patient days care

In past years the epidemics of acute respiratory diseases occurring during the winter months have reached such proportions at times that ad missions had to be restricted and the complete child population put on bed care in order to cut down the number of contacts. One episode will illustrate the problem. During one winter epidemic before control measures were instituted 22 of a total census of 30 children developed a severe type of grippe requiring a three-week period of closed quarantine with continuous bed care for all inmates in order to eradicate the infection

W F Wells2 has shown that pathogenic bacterm may be recovered from the air of children s wards in direct proportion to the number of regu

ultraviolet air sterilization in killing air borne bacteria Henle et al 1 have been able to demonstrate protection of laboratory animals against

lar inhabitants of the ward and in proportion to the types of bacteriologic flora to be found in their upper respiratory tracts Koller's has demonstrated the effectiveness of such air-borne infection by the use of ultraviolet air sterilization. Harts has demonstrated the same type of protection against wound infections in surgery Many other limited applications of this principle have been reported . S M Wheeler et al 10 were able to demonstrate that ultraviolet irradiation of the barracks at a naval training station caused a 25 per cent reduction in the incidence of respiratory infection among the inhabitants of that barracks as compared with the incidence in the control barracks

It has been shown by experimental workers in the General Electric Company laboratories that the wavelength most efficient in killing air-borne pathogens is 2537A. They developed in their laboratory a fluorescent type tube lamp with a special glass resembling fused quarts in its ability to transmit a high percentage of rays of this wavelength

Koller has developed the following specifica tions for the installation of radiant units, hung on the side walls, seven feet above the floor and so baffled that only the upper half of the room is irraduated

Ceiling height, feet Floor area per 15	8	10	12	14	16
watt lamp square foot Floor area per 30	80	100	120	140	160
watt lamp square foot	200	250	300	350	400

Such an installation will effect a sanitary ven tilation equivalent to at least 100 complete air changes per hour In our experience there have been no deleterious effects from the lights children have no difficulty in sleeping in the faint glow which resembles moonlight, sufficient light is afforded at night to obviate the necessity for night lights for nurses, the attendant staff soon noted that the usual children's institution odor had completely disappeared and some of the nurses commented upon the freshness of the atmosphere comparing it with that experienced at higher elevations

To the best of our knowledge after a rather careful search of the literature the children's building of St Luke's Convolescent Hospital is the first institution of its type to install these lamps 11 throughout, so that every cubic foot of air in the whole building is subjected to a sterilis-

Presented at the 140th Annual Meeting of the Medical Bociety of the State of New 1 rk Secti n on Pediatrics, May 2 1048

Fig 1 St Luke's Convalescent Hospital

ing effect equivalent to more than 100 complete air changes per hour. The children are never exposed to unsterilized air, day or night, except when outdoors. We feel that complete coverage of the whole building is essential as it has been shown that air currents from unsterilized portions of a building may carry pathogens to the children in distant locations, and also may infect children in transit through the unsterilized areas. Early in the study an attempt was made to correlate the diminution in the output of the bulbs with the incidence of infection (Fig. 2)

It will be seen from Fig 2 that as the efficiency of the lamps falls below 75 per cent of their original output, the incidence of infection represented by the lower line begins to rise. This is true even though there is no epidemic peak in the curve for the winter 1940 to 1941 used in this test. Because of this experience, we have since tested the output of each bulb periodically with a Luckiesh-Taylor Ultraviolet Meter, containing a special fluorescent material whose maximum sensitivity is for 2537A radiation. All bulbs are replaced immediately as their output reaches 375 microwatts per square centimeter at one foot

In discussing proper care of the lights, the necessity for frequent dusting must be mentioned as accumulation of dirt on the bulbs results in a rapid decrease in their output. Porters using stepladders which raise their heads to the seven foot level must wear sun glasses to protect their eyes. Careless exposure of the eyes or skin to direct radiation of 2537A wavelength results in a superficial crythema which is uncomfortable but not serious, nor as long lasting as that produced by the longer rays from 2800A to 3000A

Fig 3 shows the comparison of institutional respiratory disease during a three-year period from October, 1939, to October, 1942, without the benefit of ultraviolet air sterilization, as compared with the three-year period from October, 1942, to October, 1945, with the sterilizing lamps in operation. These lines represent the percentage of children with temperature elevations caused exclusively by respiratory disease. The top line represents the three-year control period, and the bottom line the three-year period with ultraviolet air sterilization. All children in the institution have a rectal temperature reading taken both AM and PM.

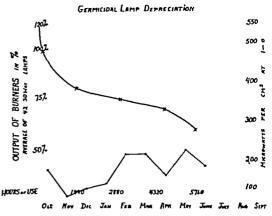

Fig 2 Germicidal lamp depreciation

routinely, and every four hours, if elevated Only those children showing temperature readings above 100 by rectum, and showing symptoms or signs of respiratory infection, are included in this study. All other causes of temperature elevation, such as rheumatic disease, surgical infections, chronic bronchial or pulmonary disease, sickle-cell anemia, etc., were excluded from the study.

Obviously the total number of bed care days is much greater than the figures in this chart would indicate, as children are not allowed up until their temperature has remained normal for several days It can be seen easily that the incidence of infection during the winter months of the three years before lights were installed was definitely greater than during the winter months of the years 1942 to 1945 It will be noted also that during the winters of 1940 to 1941 and 1941 to 1942 there occurred high peaks of epidemic proportions, and that there was also a tendency to a secondary rise in the spring months of April and May in the year 1941 to 1942 This secondary peak would suggest a loss of immunity in the remaining inmates with reinfection of the same group by new admissions

It is interesting to note that the year 1944 to 1945, which shows the highest peak in the period with lights, follows the same cycle as the untreated years but does not reach the same height. It will be remembered that the incidence of influenza type B in the general community was at a very high level during this same winter. It should be noted that there is no apparent tendency to a secondary spring rise in the lines for the treated years.

It is interesting to note that during the spring of 1943 the lights were turned off on May 31 due to a shortage of bulbs, and were allowed to remain off until October 1 The curve representing infections for that spring continues to climb upward after the lights were turned off, in spite of summer weather (represented by the dotted

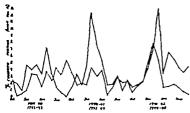

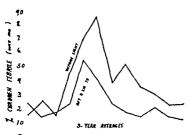

Fig. 3 Six year comparative study, showing tem perature reactions before and after air sterilization

Gas has he has he has he has her has he has her.

Fig 4 Average curves showing percentage of febrile children in periods before and after air

sterilization

lme) Because of this observation, the lights have been kept on continuously both winter and summer since October, 1943

Fig 4 illustrates the average curve for the three-year period before air sterilisation, com pared with the average curve for the three-year period with air sterilization. The curves themselves are self-explanatory Statistical analysis of these figures shows that during the threeyear control period, 3 98 per cent children were febrile, as against 2.38 per cent for the threeyear experimental period. This shows a difference of 1 60 per cent or eleven times the stand ard error of the difference and hence is a differ ence not to be attributed to sampling errors nor to chance. Comparison of the control and ex perimental periods during the winter months alone again shows a difference of 196 per cent, which is again eleven times the standard error of the difference. These figures indicate a reduction of 33 per cent in the actual number of chil dren febrile from respiratory disease for the treated years as against the untreated years

Fig 5 was constructed to study the relation ship between the total patient census day by day, with the numerical incidence of respiratory discase cases. It will be noted that there is no

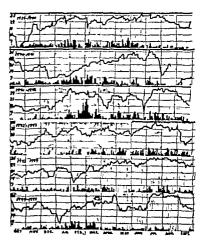

Fig. 5 Incidence of respiratory infections as related to total ceusus. Solid line denotes period without lights Solid blocks denote febrile patients

significant relationship. There are high peaks of infections occurring during periods of relatively low census and vice versa, during both the control and the experimental periods. For instance during the control period, July, 1940, shows a high census with a low incidence of infection, whereas January, 1941, shows a low census with more than twice the number of infections

In the experimental period the same holds true December, 1942, shows almost no infection in spite of a high census, whereas, January, 1945, with a relatively low census has a consider able number of infections

Something must be said about some interesting coincidental observations during the experimental period. There was an obvious though unmeas ured decrease in the incidence of respiratory disease among the adult attendants, even though they do not live in the same building and are in unsterilised air except during their working hours.

It is interesting to note that ordinary house plants do not tolerate the ultraviolet radiation and usually die in a short period of time.

Our experience with contagious disease outbreaks has been limited, but we feel that the lights are of definite benefit in this regard During January, 1944, we apparently admitted a child with unrecognized pertusus, and simultaneously there developed 5 cases of pertusus among the inhabitants of one run-around ward with a census of twelve No other cases developed elsewhere in the institution among a census of 25 children, although the diseased cases were kept in the institution throughout

In November, 1944, a case of chicken pox developed in the preschool age group which numbered 12 children, all of whom slept in one room It was interesting to observe that only 4 of the 12 children contracted the disease although all were susceptibles according to their histories of these 4 contact cases contracted the disease individually at intervals of fourteen days or No other cases developed in the remainder of the institution

One case of scarlet fever and 1 case of mumps occurred during the experimental period without any secondary cases of either disease

Studying the above observations seems to demonstrate to us that contagion due to direct mouth to mouth contact between ambulatory children at play cannot be safeguarded against entirely by the use of ultraviolet air steriliza-This very intimate type of contact, which goes on all the time in an indwelling children's institution, probably accounts for the incidence of respiratory disease noted during the experimental years We do believe, however, that the lights effectively prevent the air-borne distant spread of infection, thereby preventing mass epidemics among the inhabitants of such institutions

Because of these convictions, we feel that the original installation cost of about \$2,000, and the maintenance cost of about \$500 per year, needed to keep 50 lights operating at an output above 350 microwatts per square centimeter at one foot at all times, is justifiable for any institution

Our unreported experience for the winter of 1945 to 1946 follows the same general pattern as that of the reported years, in spite of the fact that the incidence of respiratory disease in the community reached epidemic proportions in this period 264 King Street

A NEW RICKETTSIAL ILLNESS OCCURRING IN NEW YORK CITY

Supplementary Report

BENJAMIN SHANKMAN, M D, Kew Gardens, New York

(From the Department of Cardiology, Queens General Hospital)

IN A recent issue of this JOURNAL, the writer reported a new illness, occurring in New York City that defied identification as a known disease. In the light of my personal observation of the great majority of the reported cases, symptoms and clinical course were described, environmental factors considered and physical and laboratory findings analyzed.

The causative organism could not be estabished However, I emphasized the possibility of rickettsia carried in a rodent parasite, and specified Allodormanyssus sanguineus (Hirst), a mite known to be a parasite of rodents and

capable of attacking man

This theory of causation has since been confirmed by laboratory investigations by the United States Public Health Service ¹ In these studies, a nekettisin was recovered from a saline suspension of the tissues of mites (A sanguineus (Hirst)) taken from the apartment house development where the illness was concentrated. It was found to be morphologically culturally, and serologically indistinguishable from another mite strain isolated from a mouse 'bitten' by A sanguineus (Hirst).

Both mite strains produced disease in mice, guinea pigs, and chicken embryos, and as antigens in the complement fixation test gave a reaction pattern typical of the antigens of one of my patients. Furthermore, guinea pigs convalescing from the effects of one strain were found to be immune to the other strain. It is indicated therefore, that the human infection is acquired from A sanguineus (Hirst) probably through biting

The name "rickettsial pox" is proposed in the Public Health Reports because of a clinical resemblance to chicken pox. This is an unfortunate choice of terms. In the majority of cases there is no resemblance to chicken pox for the lesions are more often papular than vesicular.

Another controversial aspect concerns enlargement of the spleen. In a bulletin issued by the New York City Department of Health, it was indicated that the spleen was enlarged in 50 per cent of the cases. This is in direct contradiction of my experience as previously reported. In none of my cases was the spleen ever found to be pal pable.

A number of interesting facts and cases have

come to light since my previous article Lesions have been noted on mucous membranes in 6 new cases examined by me and my earlier generalization to the contrary must, therefore be qualified

The possibility of diagnostic error is clearly shown in 2 of the more recent cases. In one, a child aged 21/2, years exhibited markedly swellen and tender unilateral posterior cervical glands, associated with fover and chills. A pediatrician attributed glandular enlargement to pharyngits and gave the child sulfonamide therapy. However, when the child's head was shaved, the characteristic initial lesion of the illness was revealed on the child's scalp. He was placed on aspirin, and an uneventful recovery took place

The second case was that of a man aged 32, with an ulcerated lesion on the glans penis and bilateral inguinal glandular swelling and tender ness. The diagnoses originally entertained by this writer were chancroid chance lymphogranuloma inguinale herpes progenitalis. There was no history of trauma or drug intake. Three days later the patient broke out with fever, chills, and rash characteristic of the illness in question.

Preventive measures remain the chief problem. The great majority of the cases were treated during the months of July and August However, there have been cases continually during the succeeding months Since the previous article I have seen forty more cases and six patients were under my treatment during three weeks this past With that number of cases current in cold weather the spring and summer months will probably bring a multiplication of the mites which apparently thrive in a warm atmosphere. having been found preponderantly in and about incinerator walls. Thus a greater incidence of the disease may be expected-perhaps equalling or exceeding last year's endemic proportionsunless preventive measures are promptly and intensively undertaken Obviously, this is a matter for action by the New York City health authorities

CORRESPONDENCE

Diphtheria Prophylaxis

To the Editor

Inasmuch as the matter of diphtheria prophylaxis is of such great importance, I should like to comment on the paper entitled, "Diphtheria in Upstate New York, 1908–1946," by Ingraham and Korns of the Division of Communicable Diseases, New York State Department of Health (New York State J Med

46 2414 (Nov 1) 1946)
These authors state that, "Whenever prophylactic antitoxin is given there also should be administered in every instance an accompanying injection of 10 cc of alum-precipitated toxoid injection of toxoid should be given a month later The combined use of antitoxin and toxoid has been standard French and German practice for some years The evidence in humans is not clear-cut as to the extent to which the antitoxin interferes with the antigenic action of the toxoid Experiments on animals indicate that antitoxin interferes but slightly with alum-precipitated toxoid as compared with fluid toxoid, although the latter is at least partially effective "

This statement is at variance with an editorial comment entitled, "Combined (Active-Passive) Diphtheria Prophylaxis," which appeared in the Journal of the American Medical Association (113 1884 (Nov 18) 1939) The writer presents evidence that depute the fact that active resembles the contraction of the contraction o that despite the fact that active-passive diphtheria immunization has been proved possible in laboratory

animals, it is not feasible in man He cites the work of Paschau (Klin Wchnschr 18 7 (Jan 7), 60 (Jan 14) 1939) and Frey and Schmiel (Zischr f Immunitatisforch w Exper Therap 95 486 (June) 1939) of the Red Cross Hospital, Vienna These investigators injected 2,000 units of diphtheria antitoxin intramuscularly into each of 20 children, and followed this with single or multiple subsurfaceous in lowed this with single or multiple subcutaneous in jections of diphtheria toxoid Alum-precipitated toxoid was used in most of the tests Periodic titrations of the antitoxin content of the blood serum was They found that not only could then performed no active immunity be induced by this method, but that the toxoid had the adverse effect of hastening the elimination or destruction of the injected anti-They concluded that combined active-passive immunization is not feasible in the human being, since the two types of immunity are not compatible with each other. This conclusion was confirmed by one of their patients, who contracted diphtheria during the course of their attempted combined immunization

I trust that this letter will lead to further clanfication on the subject of diphtheria prophylaxis.

> (Signed) IRVING KOWALOFF, M.D. 7 Groton Street Forest Hills, New York

January 15, 1947

Reply by Dr Ingraham

To the Editor

The method of combined active and passive immunization for unimmunized familial childhood contacts of diphtheria cases was recommended largely on the basis that opportunity should be taken to If a parent initiate active immunization promptly had failed to secure active immunization for his child, it is probable that his interest in having the child immunized would be evanescent

It is necessary to take issue with the statement in the editorial in the Journal of the American Medical Association for Novebmer 18, 1939, that "

had the deleterious effect of hastening the elimination or destruction of the transferred antitoxin' Neither the authors quoted, nor any subsequent, have demonstrated that the antitoxin in combined immunization is eliminated at a significantly more rapid rate than is antitovin given by itself Heterologous serum is normally eliminated with considerable rapidity, and it has long been known that passive immunization can only be relied upon for a twoto-three week period Furthermore, the failure to protect, cited in the editorial, can be duplicated among persons given only antitoxin Hence, I believe it safe to assert that there is no valid evidence to indicate that combined active and passive immunization has any deleterious effect

Since 1939, a considerable amount of positive evidence on the value of the procedure has been accumulated, both in humans and in animals, which has largely explained the negative results cited German authors used larger doses of antitoxin than are currently recommended in this country they failed to follow blood titers on their subjects for a sufficiently long period. The most important studies on this subject are by Downie, Glenny, Parish, Smith, and Wilson, in the British Medical Journal (2 717 (Nov 22) 1941), and by Fulton, Taylor, Wells, and Wilson, in the British Medical Journal (2 759 (Nov 29) 1941) The paper by Downie et al also contains a valuable review

The first team of workers utilized some 300 thirdyear medical and farm-training students mately half the group were given 01 cc of alumprecipitated toxoid, and 350 to 500 units of diph theria antitoxin, followed four weeks later by 0.3 of alum-precipitated toxoid The other half were given alum-precipitated toxoid by the same schedule, but no antitoxin Blood titers were fol schedule, but no antitoxin lowed for a period of twelve to twenty-seven weeks. The general conclusion was that the antitoun in the combined method does interfere to a certain extent with the primary response to toxoid, but does not abolish the sensitizing influence which leads to the very rapid production of antitoxin when toxoid is administered at a later date

The second team of workers conducted a successful field trial with the method of combined immunization in seven residential and nonresidential schools in which diphtheria had broken out

population investigated was about 1,500

Although the details of optimum proportions of toxoid and antitoxin have not been worked out, it does appear to be highly probable that in instances where passive immunization against diphtheria is indicated, there is virtue in the simultaneous administration of alum-precipitated toxoid

For those who are interested in a more complete review of the subject, we would strongly recommend the two articles quoted above in the British Medical Journal, together with the accompanying editorial

in the latter issue

ANNUAL REPORTS

MEDICAL SOCIETY OF THE STATE OF NEW YORK

1946-1947

Report of the President

To the House of Delegates Gentlemen
The Medical Society of the State of New York
has suffered grievous blows during the past year
First Dr Kirby Dwight, for several years Treasurer and recently a Trustee, after a lingering illness, died early in December Only those closely associated with him can appreciate the tremendous less his death has brought to the Society His keenness of intellect, his tolerance his unfalling humor and his

wisdom will be sorely missed Next Dr James M Flynn a former President, and active in the committees of the Society died later in the same month Aggressive determined and an intense advocate of all for which medicine

stands, his place will be hard to fill.

Then there came a crushing blow in the sudden death on January 16 last of Dr William Hale our President. Quiet and unassuming he did a tromendous amount of work for the Society shall miss him greatly
Thirty days later Dr F Leslie Sullivan Speaker

of the House of Delegates was taken from us. He had been a tireless worker for the Society had a

genial personality and was respected and admired All this causes us to pause and wonder why so many of our officers have been stricken. It is not age as none of them were old. Is it because we have placed too heavy burdens on those we have chosen for positions of importance? These men with the exception of Dr Dwight were active in the practice of medicine, which in itself is a sufficiently heavy load Then we have put more and more on them, willing as they were, and it seems probable that we have asked too much

I do not believe that the vast majority of our members realize what the Society does for them More affort should be placed on keeping them in

formed.

The Directory will soon make its appearance again That and the JOURNAL are familiar to all our mem bers, but that is not true of our other activities

The Public Health and Education Committee with its numerous subcommittees does a tremendous amount for our members which they little realize
The new Veterans Medical Service Plan of New

York, Inc. has been the greatest step ever to protect the private practice of medicine. It is estimated that \$8,000 000 to \$10 000 000 will come to the doctors of New York State yearly because of it.

At least \$25 000 000 is spent yearly in Workmen a Compensation fees. In our Society this is presided over by the Workmen's Compensation Committee and Direct Private
and Bureau.

The Legislative Committee, our Executive Officer and the Bureau of Public Relations have done a noble task the past year The chiropractic bill was defeated and medical research was protected to mention only two of their tasks.

The Society, through its Committee on Malpractice Defense and Insurance not only provides in surance at reasonable rates, but even though the member is not insured, he has free legal defense in

any suit.
The Public Relations and Economics Committee together with the Bureau of Medical Care Insurance is assisting in the formation and improvement of voluntary medical care plans, another protection to the private practice of medicine.

The status of the welfare patient and of the doctor taking care of him has been immeasurably bettered by the Subcommittee on Public Medical Care

There are many other committees which are active and all working for the protection of both the public and the physician

The activities of the Society are constantly ex panding and that means increased expenditures Where else could one obtain the services he obtains

where ease could one obtain the services he obtains for his membership duce?

In my opinion the House of Delegates should give serious thought to increasing the duce.

At this writing my term as President has been less than a month but already I have met with the wholehearted cooperation of committee chairmen the directors of the various Bureaus, the office staff, and especially the help of Dr Anderton and Mr Anderson. I realise more and more how for tunate the Society is in having such efficient per sonnel. One does not have to preside over the Council, but merely to sit in it, month after month to know how devoted all the Council members are to the interests of the Society It is a privilege to be associated with them.

For a survey of the Society's activities during the past year, attention is invited to the report of Dr Hale's activities, compiled by the Public Relations Bureau which follows, and to the reports of Officers

and the Council

Respectfully submitted LOUIS H BAUER, M D , President

Dr William Hale took office in May 1946 as President of the Medical Society of the State of New York and served actively until his untimely death on January 16

In his inaugural address to the Society in May 1946 Dr Hale declared his interest in three different spheres—matters to which he would turn his attention during his term of office. They were medical care for war veterans, development of the Woman s Auxiliary as a useful and constructive influence in Auditary as a usual and constructive innuence in medical society affairs, and cooperation in the cam paign against cancer — In a high degree he attained these aims before his death.

Dr Hale gave his time, energy, and thought most generously during his term of office. In June, shortly after his inaugural, he addressed the annual conference of public health officers and nurses in Saratoga Springs, urging greater understanding between practicing physicians and public health executives. He pointed out that the aim

of both groups was the same, only the functions differed. His talk was widely reprinted in the

public press and in medical journals

716

To each of the district branches of the Society, Dr Hale brought a special message as he attended their annual meetings. He spoke in turn on the necessity for a high quality of medical care for the veteran, he outlined and clarified the socialized medicine issue, he praised the progress of voluntary medical insurance throughout the State and urged more support for the organized plans. In a talk before the Bronx County Society, he described the functions of the State Society and emphasized the importance of the county unit in the life and effec-

tiveness of the state unit He addressed the Monroe County Society's annual meeting in December

To the development of a joint plan by the Society and the Veterans Administration for the medical care of veterans, Dr Hale made an exceptional contribution. He served as acting chairman of the hason committee of the two organizations until Veterans Medical Service Plan of New York, Inc., was formed. He then became one of the directors of the plan.

Until the very last, Dr Hale was an effective spokesman for the Society he headed On Saturday, January 11, he spoke on the A.M A radio series, "Doctors Then and Now," over the coast-to-coast network of the National Broadcasting Company On January 13 he addressed the Zonta Club of Utica on socialized medicine and was scheduled to speak to the Century Club the same week. His sudden death on January 16 cut short a career of great usefulness to the profession he served so heartily and so well

Report of the Secretary

188

To the House of Delegates, Gentlemen

Membership—Elected in 1946 were 1,685 new members, 251 were reinstated. The net increase for the year, as shown below, was 1,290

Membership-December 31, 19,234 1945 1,685New members—1946 Reinstated members—1946 251 21.170Deaths 200 254Resignations License revoked 1 Licenses suspended 3 458 20,712

Dropped for nonpayment of dues as of December 31, 1946

Total membership as of December 31, 1946

843 members are in the service of our country

Honor counties (none of whose members failed of their dues in 1946) include Broome, Cayuga, Chautauqua, Clinton, Cortland, Delaware, Essex, Franklin, Fulton, Genesee, Greene, Lewis, Madison, Ontario, Orange, Orleans, Putnam, Richmond, Rockland, Schuyler, Seneca, Tompkins, Warren, Wayne, and Wyoming

Comparative totals of membership since 1935 fol-

1935	14,064	1941	17,781
1936	14,662	1942	18,313
1937	15,529	1943	18,652
1938	16,177	1944	18,941
1939	16,785	1945	19,234
1940	17,409	1946	20,524

Publication.—Preparation of the Medical Directory of New York, New Jersey and Connecticut, the first since 1942, has entailed much diligent work by a special staff. Its issue was delayed by difficulty in obtaining paper. It is regretted that some members of our profession returned too late from service with the armed forces or Public Health Service to be listed. However, we hope that another edition

or a supplement in 1948 will rectify such unavoidable errors

During the past year, the New York State Journal of Medicine has continued to improve, both in editorial and scientific contents. A new section regarding veterans' affairs has been added, as well as summaries of minutes of the Council meetings.

Council.—The Council organized directly after the last Annual Meeting—It has met monthly since then, except in July and August, 1946—The Council delegated Dr J Stanley Kenney and your Secretary to represent our Society at the 1946 annual meetings of the Medical Society of New Jersey and the Medical Society of the State of Pennsylvania. Also, the Council has invited the medical societies of Vermont, Connecticut, New Jersey, and Pennsylvania to send representatives to our own Annual Meeting this year

Our full quota of delegates represented the Society in the House of Delegates of the American Medical Association at San Francisco, California, in July, and at Chicago, Illinois, in December Under the chairmanship of Dr Floyd S Winslow, your delegates carried out your instructions and those of the Council, attended the meetings conscientiously, and represented our Society properly

Although reports of the Council and committees appear elsewhere, your Secretary takes pleasure in commending to you the diligent and untiring work of members of these bodies. A reorganization of committees has been attempted. At the request of the American Medical Association, the Council voted in October, 1946, to add a Subcommittee on Mental Hygiene to the Public Health and Education Committee.

Directives from the House of Delegates to the Council are reported under the heading, "Résumé of Instructions of the 1946 House of Delegates and Actions thereon of the Council, Board of Trustees, and Officers"

Comments.—Your Secretary has endeavored conscientiously to perform his prescribed duties. I have attended all committee meetings, except when

two met at the same time. Your Secretary went to each of the eight District Branch meetings the American Medical Association Annual Meeting of State Secretaries and Editors the A.M.A. House of Delegates the regional meeting of the American Medical Association Council on Medical Service in Philadelphia on November 21, the Annual Conference of County Medical Societies Secretaries in Albany on October 23 the Annual Meeting of County Society Legislative Committee Chairmen February 25 the American Medical Association Seventh Annual Congress on Industrial Health in Boston Massachusetts on September 30 and I represented your Society at the Congress of Physical Medicine in New York City on September 4 and the American Social Hygiene Association in New

York City on February 5 I was also honored with an appointment to the New York State Labor Department Committee to Study Proposed Changes in the Workmen s Compensation Law Minimum Fee Schedule, and to the Nurse Advisory Council of the Education Department.

In closing, allow me to express publicly my deep personal gratitude to my fellow officers, the council lors, trustees and members of the office staff of the Medical Society of the State of New York, for their over willing cooperation courtesy and thoughtful

ness during the past year

Respectfully submitted W P ANDERTON M D . Secretary

(The Report of the Treasurer will be published in the April 15 issue)

Report of the Board of Trustees

To the House of Delegates Gentlemen

This report covers the period from May 1 1946 to February 12, 1947 A brief supplemental report for the period, February 12 to May 5, 1947 may be issued for presentation to the House at the Annual Meeting

Meetings of the Board were held in May June, September, October November, and December of

1946 and in February of 1947

Dr George W Kosmak declined to stand for re-election to the Board of Trustees because of the great increase in his duties as Managing Editor of the Nzw York Statz Journal or Videocine and was succeeded by Dr. Kirby Dwight who had served the Society so faithfully as Treasurer for so many years Unfortunately the Board which had profited so much from Dr Dwight's advice during his term as Treasurer was not to have the advantage of his judgment and wisdom because he was taken seri ously ill before the June meeting of the Board and was able to attend but one other meeting, in November prior to his death in that month. was a great loss not alone to the Board of Trustees but also to your House of Delegates and to the medi cal profession of the State He was not only a learned physician but a wise financier and above all a gentleman of the old school in the best sense of that term. He will not be forgotten by those of us who were associated with him for many years and who were his friends as he was ours

The Society and the Board were very fortunate in the election by the Council of Dr Edward R. Cun niffe to complete the unexpired term of Dr Dwight because of his former experience and great sorvice as a member of the Board of Trustees and as Presi dent of the Society In the opinion better choice could have been made In the opinion of the Board no

Finances.-The report of the Treasurer will give the detail of the income from various sources and classified expenditures and the Society's invest ments and its net worth so that duplication of that report will not be made here.

It may be interesting, however to consider the continuing increase in the expenditures of the Society over a period of the past several years and here below is given the comparison of the budget appropriations and the expenditures from January of 1933 to January 1947 together with the receipts from annual dues for the corresponding years
The column headed 'Income' in the table on page

718 (top) represents the income from dues only and does not include any of the income from invest ments which income the Trustees have endeavored to preserve for reinvestment and the maintenance of the integrity of our Investment Fund which was originally constituted solely for the purpose of maintaining a working capital that might be preserved against an emergency confronting the whole pro-

fession of the State

For years the intent and purpose of the Board of Trustees since its foundation has been to maintain the total expenditures well within the dues income so that whatever surplus accrued might be transferred to the emergency investment fund of work ing capital. It should be remembered also that the budget does not originate with the Board of Trustees. It originates with the Council and is sub-mitted to the Board of Trustees for their considera tion and their making of changes only, as in their opinion is compatible with sound finance Any changes in policy must be initiated by the House of Delogates or the Council, and the Board has been ex tremely careful to avoid even the appearance of making any changes in the policy of the Society As a result of the financial policy of the Board of Trustees, it might be noted that as of the last com-plete audit up to and including December 31, 1945 received by the Board on November 26 1946 the total value of the Society's investments was \$473 925 which was in excess of the costs of these invest ments in the sum of \$47,460.59 and the total appreciation from the date of purchase on the bonds and mortgages was \$11 842.77, and on the pro-ferred and common stocks from the date of purchase, \$35 977.82 and some of these purchases went back to the year 1926 when the first Board of Trustees was elected and the first small sum of money was set aside from the income of the Society to provide the nucleus of the investment fund. In addition to the appreciation of the capital investment, the average yield has approximated 41/4 per cent and for

Year	Annual Dues Income	Budget Appropriations	Expenditures
January 1 to December 31 1934 July 1 1933 to June 30 1934	\$132,076 00	\$157,766 <i>5</i> 0	\$118 217 00

January 1 to December 31, 1945	\$148,190 00	\$193,416 66	\$131 745 69
January 1 to December 31 1946 January 1 to December 31 1947	(estimated) \$149,450 00	\$200 755 83 \$202 278 50	\$178,080 19
Tanday a to 2000mbd of 1011		4-410 00	

the fiscal year of 1945 the yield on the securities held by the Society was 4 03 per cent. It has been fortunate that from its inception the Board of Trustees has had at least one of its members a physician who is also a bank officer.

The A Walter Surter Estate was closed during the month of December, 1946, and the final settlement made with the executors of the Estate and the final sum in settlement paid to the Society These moneys will accrue to the A. Walter Surter Lectureship Fund

The custodian of the investment fund of the Society is the Chase National Bank of the City of New York, at 11 Broad Street, New York City, and in their report, under the date of January 8, 1947, they list our investment portfolio as follows in the table

below

The indicated annual income of \$13,373 represents a return of 3 3 per cent on the invested funds, excluding from consideration Series "C," "D," and "F" Savings Bonds on which interest accrues in the form of increased redemption value. The composition of the portfolio continues to be conservative.

Contracts —Renewal of annual contracts with Dr David W Kaliski, Dr Robert R. Hannon, Mr George P Farrell, and of the triennial contract with Mr Dwight Anderson, and a new contract with the firm of Hackeling and Oberkirch for the annual audit of the accounts of the Society, as recommended by the Council, were approved by the Board of Trustees Also, in accordance with the recommendation of the Council, Mr Thomas E Walsh was engaged as an assistant to Mr Dwight Anderson under an agreement as recommended by the Council, and all the written contracts were signed by the Chairman of the Board, for the Board Also, there have been increases of approximately 10 per cent in the pay of practically all of the employees of the State Society as recommended to the Board of Trustees by the Council

The Veterans Medical Service Plan of New York, Inc—All the members are undoubtedly familiar with the fact that at the request of the Veterans Administration the Medical Society of the State of New York was asked to supervise the extension of

medical care to veterans with service-connected disabilities, to be provided by physicians of their own choice and that a Council Committee entered into negotiations with the Veterans Administration following which pegotiations a contract was com pleted by the Veterans Administration and a non profit corporation entitled The Voterans Medical Service Plan of Now York, Incorporated All of the Board of Directors of this corporation are mem bers of this Society and the majority of them are officers or members of the Council or of the Board of Trustees of this Society The details of this organi sation will be given in the report of the Council and will not be touched upon here except as to certain financial arrangements which had to be made to put the plan in operation. According to the terms of the contract, the Veterans Administration agreed to reimburse the corporation for expenses incurred in the payment of the salaries of the coordinators in the Regional Offices of the Voterans Administration who were to be employees of the corporation in the sum of not to exceed \$10 000 per annum per Regional Office and these payments were to be made quarterly in arrears. The plan went into effect on September 10, 1916, and in view of the fact that the contracts entered into with the coordinators provided for payment of their salaries monthly and that no moneys would be received by the corpora tion from the Veterans Administration for any ex penses whatsoever until the expiration of the first quarter of the operation of the plan it was necessary for the corporation to secure a sum of money sufficient to pay the salaries of the coordinators in the first three Regional Offices constituted corporation was therefore granted a loan of \$15 000 by the Board of Trustees upon the recommendation of the Council This loan was secured by a joint and several note signed by each member of the Board of Directors of Veterans Medical Service Plan of New York, Inc., payable to the Society without interest. In addition to that sum, a grant of \$2,000 without security was made to the Veterans Medical Service Plan to cover expenses of meetings of the Board of Directors stationery and other necessary expenses of the Board and the coordina tors. It is hoped that arrangements may later be made with the Veterans Administration to have this sum of \$2,000 reimbursed to the Society, because one of the conditions of the contract with the Veter ans Administration was that renegotiations of the contract by either of the two parties might be made at the termination of each quarter following the signing of the original contract. It may be necessary sometime in the future to authorize the Board of Trustees to earry this sum as a grant-in-aid to
the Veterans Medical Service Plan, Inc. and cancel
the note held as security following an agreement
with the corporation that if and when the plan ter
minates and the final payment is made by the Veter
ans Administration to the corporation the corpora
ten will repay this original lean of \$15 000 to the
State Secrety upon the receipt of the final settlement.
This can only occur if and when the plan is ter
minated and the contract between the Veterans
Administration and the Veterans Medical Service
Plan Inc, is shrogated.

Resolutions Received from the House of Delegates.—The Board desires to express its appreciation of the approval by the House of Delegates of the report of the Beard of Trustees made to the 1946 meeting of the House as stated in Section 59 of the Minutes of the House for that meeting and desires to report anew that the Board of Trustees has directed that the plan recommended by the House at that time has been placed in operation

In accordance with the direction of the House at the last meeting that the Council and the Trustees provide for an audit of the accounts concerned in the matter of malpractice insurance and legal defense, the Board approved and entered into a contract with the firm of Hackeling and Oberkarch pursuant to the recommendation of the Malpractice Defense and Insurance Board and of the Council, and this contract was signed by the Chairman of the Board for the Board. In view of the fact that this audit must cover a period of at least ten years, the cost to the Society will be nearly true that of the cost for the annual audit for the Society proper

Miscellaneous—The Trustees desire to express their sincere appreciation of the efficient cooperation of the Secretary and the Treasurer of your Society for their great aid and their loyal faithful and devoted service to the Society and the conduct of the executive supervisory, and financial affairs of the Society—The Board further desires to express its thanks to the legal counsel and the attorney for the time and faithful and extremely valuable legal advice that they have given to your Board and desire to commend them therefor

Recommendations.—The recommendations of the Board will be presented in a supplementary report.

Respectfully submitted

ALBERT A. GABTNER, M D WILLIAM H ROSS M D JOHN J MARTERSON M.D EDWARD R. CUNNIFFE, M D JAMES F ROOMST M.D Chairman

Report of the Council

To the House of Delegates, Gentlemen

Your Council has the honor to report on the executive and administrative affairs of the Society in the period following your last meeting on April 29 to May 3, 1946 The various matters that came before it, actions thereon, and recommendations, are here presented

and note processes

Finance Committee

The Council Committee on Finance has the following membership

Louis H Bauer, M D, Chairman
J Stanley Kenney, M D
F Leslie Sullivan, M D (deceased)

Hempstead
New York
Scotia

By direction of the House of Delegates, the Finance Committee has given further study to the proposition of the Society's financing the advanced education of the children of its members who died in the military service during the late war. This is to constitute the War Memorial of the Society

All counties but two have furnished the necessary information These counties are Oswego and Putnam Since they are small counties they will not affect the figures materially

There are 64 children in all, 34 boys and 30 girls

The age groups are as follows

Age	Number	Boys	Gırls
0 to 5 years	21	14	7
6 to 10 years	24	12	12
11 to 15 years	12	Б	7
16 to 20 years	5	2	8
Over 21 years	2	1	1

Since the Society must budget its funds as far as possible, the Committee recommends that "advanced education" be interpreted to mean college education for not more than four years, and advanced professional education for not more than four additional years. To pay actual expenses would entail a great deal of bookkeeping and require numberless vouchers on the part of the recipients. Hence, the Committee recommends that the money be provided in the form of scholarships in the amount of \$1,000 per year per person. These scholarships should be known as the Medical Society of the State of New York War Memorial scholarships.

There is no way of estimating how many of the children will wish to take advantage of the plan — It is believed, however, that we should plan on all of them wanting college education, with two thirds of the boys and one third of the girls desiring advanced

professional education

This will amount to nearly \$500,000 It will be distributed over a period of twenty years. The first four years will average about \$5,000 a year. It will increase to a maximum of about \$33,000 a year for the period 1961 to 1964. Then it will taper off and in the final four years will drop to about \$12,000 a year.

With the increasing commitments of the Society, it is manifest that the Society cannot finance this

through its present dues income

Voluntary contributions may be sought, especially during the next two years. An intensive campaign could be conducted to raise funds for the purpose If every member of the Society would contribute twenty-five dollars, the total amount necessary could be raised. It seems idle to believe that this amount will be raised by voluntary contributions

It seems probable that sufficient sums can be raised to finance the project for the first few years. Then it will be necessary for the Society to decide whether to levy an assessment or to request the Trustees to take the amount necessary from year to year out of the capital funds.

An alternative would be to raise the dues now to at least \$15 a year, earmarking \$3 00 of each member's dues for a period of eight years for this purpose The other \$2 00 would go to the general expenses of the Society, which the Finance Committee

feels is both needed and justified

The Committee feels that the House of Delegates, if it approves establishing the War Memorial, should determine the method of financing it

It will also undoubtedly be necessary to form a committee to administer the program and determine eligibility

Constitution and Bylaws

The Council Committee on Constitution and Bylaws has the following membership

James R. Reuling, M D , Chairman
George W Kosmak, M D
W P Anderton, M D
Bayside
New York
New York

There have been no official meetings of the Committee during the year All matters referred to the Committee have been handled informally, but re-

ported to the Council for approval

Requests from the counties of Monroe, Oneida, Erie, Westchester, Queens, Tompkins, Onondaga, Warren, New York, and St Lawrence for approval of changes in their Bylaws have been received These have all been acted upon, in a few instances after some correspondence with the Secretary of the county society concerned

PART I

Postgraduate Education

The Council Committee on Public Health and Education has the following membership

O W H Mitchell, M D, Chairman George Baehr, M D Charles D Post, M D

Advisers

Edward S Godfrey, Jr, MD, Commissioner, State Department of Health, Albany

James E Perkins, MD, Deputy Commissioner,

State Department of Health, Albany

The Council Committee on Public Health and Education arranges for instruction in a wide variety of subjects. Speakers are provided by the Committee for meetings of county medical societies, hospital staffs, and other medical groups. This program is made available through the combined efforts of the faculties of the medical schools and research institutions in New York State, the New York State Department of Health, the Dental Society of the State of New York, the Division of Industrial Hygiene and Safety Standards of the New York State Department of Labor, the Medical Society of the State of New York, and several other organizations and associations

For programs arranged by the Committee, the Medical Society of the State of New York pays the traveling expenses of the speakers, and the honoraria for all speakers are paid by the New York State Department of Health

Instruction may be arranged as a single lecture, series of loctures, or a teaching day which is a combination of clinics, demonstrations, and lectures for

an afternoon and evening

The Committee prepares and distributes the Course Outline Book which lists subjects and speakers available The Course Outline Book has been revised annually, but this year because of printing difficulties, it is many months late and there will not be a publication issued in 1947 but a supplement will be distributed to those who have already re-

ceived the 1946-1947 issue

On June 13 1946, in New York City, the Council Committee on Public Health and Education held its annual conference with representatives of the New York State Department of Health to review the activities of the Committee in the field of postgradu ate medical education for the year and to discuss plans for the coming year To acquaint the group present with the work accomplished by the Committee for the past five years data were distributed. This material showed the counties in which instruction was presented the subjects given and the per centage of attendance at meetings of county medical societies from 1941 to 1946. The Committee ex pressed the appreciation of the Medical Society of the State of New York to the New York State Department of Health for not only the cooperation of the Department in developing programs but, also for the financial assistance received Present at this conference were the Assistant Commissioner for Medical Administration the Assistant Commissioner for local Health Administration, and several directors of various divisions of the New York State Department of Health the Director of the Division of Industrial Hygiene and Safety Standards of the New York State Department of Labor, mem bers of the Council Committee on Public Health and Education, chalrmen of the Subcommittees of the Council Committee on Public Health and Education and some of the officers of the Medical Society of the State of New York.

In May, 1946 letters were sent to the physicians who arranged courses of instruction for inclusion in the Course Outline Book requesting them to make any changes in subjects and speakers desired

Letters were also sent to the heads of several departments of the nine medical schools in the State, requesting them to provide the Committee with names of physicians from their departments who would be willing to participate in the postgraduate program of the Medical Society of the State of hew lork. As a result of this correspondence additional series of loctures on bacteriology, general medicine neuropsychiatry proctology and surgery are included in the 1946–1947 Course Outline Book

On September 11 1946 in New York City, the Council Committee on Public Health and Education held a conference to discuss final plans for the printing of the Course Outline Book. Present at this session in addition to the Committee members, were some of the officers of the Medical Society of the State of New York, the Deputy Commissioner of Health and directors of the several divisions of the New York State Department of Health.

Following this conference, the material for the Course Outline Book was submitted to the printer The book contains 67 announcements, including courses of lectures teaching day programs and single lectures on special subjects.
Copies of the 1946-1947 Course Outline Book have

been mailed to the following officers of the Medical Society of the State of New York, presidents secretaries and chairmen of Public Health, Postgradu ate Education and Program Committees of county medical societies, the delegates from the various county medical societies to the Annual Meeting of the House of Delegates of the Medical Society of the State of New York in May, 1947 in Buffalo, members of the Council Committee on Public Health and Education, and the Subcommittees, Regional Chairmen in Obstetrics and Pediatrics, the ex-presidents of the Medical Society of the State of New York, the presidents of the District Branches, section delegates, the State Commissioner of Health. the Deputy Commissioner of Health Deputy Commissioner for Local Health Administration, and directors of the various divisions of the New York State Department of Health, district health officers city and county health commissioners, physicians who arranged courses for inclusion in the Course Outline Book, President, President-elect, and Secretary of the Dental Society of the State of New York, deans of the medical schools in the United States, presidents of universities in New York State, librarians of the medical schools in New York State, secretaries of the state medical schools in New York State, secretaries of the state medical scoletos in the United States executive health societies in the various states executive heatin officers of the various states secretaries of the na-tional medical societies, members of the New York State Board of Regents, the New York State Commissioner of Education and directors of some of the divisions of the New York State Education Department, the Director of the Division of Voca tional Rehabilitation of the State Education Department, Commissioner of Mental Hygiene, State Department of Mental Hygiene, Commissioner, Deputy Commissioner for Public Assistance and Director of Vocational Rehabilitation Service of the State Department of Social Welfare, officers of the American Medical Association and members of the Council on Medical Education and Hospitals, Council on Medical Service, Council on Industrial Health the Director of the Bureau of Health Education, members of the Section on Preventive and Industrial Medicine and Public Health of the American Medical Association, representatives of the National Foundation for Infantile Paralysis, and the Metropolitan Lufe Insurance Company, the Surgeon General of the United States Public Health Service, Secretary and Executive Secretary of the State Charities Ald Association, and repre-sentatives of the New York State Health Preparedness Commussion

Arrangements for postgraduate instruction pre-sented as series of lectures or as single lectures on special subjects, were made for 29 county medical societies. The following counties have had or will have had this instruction

ing veteran

PART II

Maternal and Child Welfare

Maternal Welfare.—At the request of the Director of the E MIC Bureau of the New York State Department of Health, meetings of the Council Committee on Public Health and Education and the Committees on Maternal and Child Welfare were held in New York City on June 12 and August 14 1940 to consider qualifications of physicians who requested specialists ratings in the E.M.I C Program. Also present at these sessions were some of the officers of the Medical Society of the State of New York and representatives of the New York State Department of Health

The Chairman of the Council Committee on Public Health and Education received a com-nunication dated August 19 1946 from the Direc-tor of the E M.I.O. Bureau of the New York State Department of Health requesting that the Medical Society of the State of New York designate physicians in certain specialties to act as advisers to the Department in the processing of applications from physicians requesting specialists ratings in the E.M.I.C. Program. The names of the following physicians were submitted to the President of the Medical Society of the State of New York and were approved at the meeting of the Council on September 12 1946

Oldaryngology Gordon D Hoople M D 713 East Genesce Street, Syracuse 2

General Surgery Edward R. Cunniffe, M D 2515

Grand Concourse Bronx 58 Orthopedic Surgery Charles M Allaben M D 114 Murray Street, Binghamton

Plastic Surgery Gustave Aufricht, M D, 103 East 80th Street New York 28 ermatology Herbert H Backus M D 89 Dermatology Herbert H Bryant Street, Buffalo 9

Internal Medicine Albert F R. Andresen, M.D., 88 Sixth Avenue, Brooklyn

The above-mentioned physicians will act in an advisory capacity to the State Department of Health in the E.M.I.C. Program the Rehabilitation Program and any other activities for which the Department desires such service

At the request of the New York State Department of Health a meeting of the Council Committee on Public Health and Education was held on September 11, 1946, to consider the qualifications of physicians who requested specialists' ratings. Present at this meeting were the chairmen of the Committees on Maternal and Child Wolfare, members of the Subcommittee on Rehabilitation, the group of physicians designated as advisers to the State Department of Health, some of the officers of the Medical Society of the State of New York, and the representatives of the New York State Department of Health.

On November 12, 1946 a meeting of the Committee on Maternal Wolfare and the Committee on Public Health and Education was held in New York to discuss the postgraduate educational program with regard to holding of regional maternal welfare teaching days throughout the State meeting the Committee recommended that letters be mailed to the Regional Chairmen in Obstetries expressing the desire of the Committee that such meetings be held. This was done and it is hoped that a teaching day will be held in each of the twelve

Committee members were some of the officers of the Medical Society of the State of New York. The Chairman of the Committee on Maternal Welfare has attended meetings of the Subcommittee on Rehabilitation For a report of these activities, see the report of the Subcommittee on Rehabilita-

Child Welfare —Members of the Committee on Child Welfare attended meetings held by the Council Committee on Public Health and Education to consider qualifications of physicians requesting specialists' ratings in the E M I C Program. For a report of these activities, see the report of the Committee on Maternal Welfare

The Chairman of the Committee on Child Welfare has attended meetings of the Council Commit-tee on Public Health and Education with the Subcommittee on Rehabilitation For a report of these activities, see the report of the Subcommittee on Re-

habilitation

On December 4, 1946, and January 8, 1947, meetings of the Committee on Child Welfare were held in New York to further consider the plan of the New York State Department for the establishment of "Pediatric Institutes for General Practitioners" The plan is to have the State divided into regions with the Institute centered around the medical schools in the State The plan has not been suf-ficiently developed to receive the approval of the Committee on Child Welfare

At the meeting of the Committee on Child Welfare, on January 8, 1947, the use of B C G vaccine in New York State as a part of the Tuberculosis Control Program was discussed It was the opinion of the Committee that the medical profession in this State should be informed about BCG immunization and that an educational program should be inaugurated Present at these sessions, in addition to the Committee members, were some of the officers of the Medical Society of the State of New York and representatives of the New York State Department of Health

medical profession generally, to participate in an

active and progressive program
On October 9 1946, a meeting of the Council
Committee on Public Health and Education and the Subcommittee on Cancer was held in New York City Present at this conference, in addition to the Committee members were some of the officers of the Medical Society of the State of New York and representatives of the New York State Depart-ment of Health This meeting was held for the purpose of developing a plan whereby groups inter ested in cancer, such as the New York State Divinon of the American Concer Society the State available for educational purposes, and the Medical Society of the State of New York, could be more closely integrated After thorough discussion the following motion was made

That the Council of the Medical Society of the State of New York submit a recommendation to the State Division of the American Cancer Society and the other divisions—Westchester Nassau and New York City—and the Commis moner of Health of New York State, expressing its opinion that a great deal of value could result from the establishment and maintenance of an romical use of funds in an effective program The Council feels that a mechanism for coordination and conference should be established

The Council suggests that the Commissioner of Health of the State of New York and the proper representative of the Medical Society of the State of New York call such a meeting of the representatives of the New York State Division of the American Cancer Society including repre-sentatives of the Westchester Nassau Suffolk and New York City Divisions and representatives of the New York State Department of Health and the Medical Society of the State of New York.

This Motion was adopted at the meeting of the Council of the Medical Society of the State of New

York on October 10, 1946 On November 7, 1940 in New York City, a meet-ing of the Council Committee on Public Health and Education and the Subcommittee on Cancer was held with the representatives of the New York State Divisions of the American Cancer Society, including New York City, Nassau Westchester, and the New York State Division Also present at this conference were some of the officers of the Medical Society of the State of New York and representatives of the New York State Department of Health and the City of New York Department of Health At this conference the programs of the different groups represented were discussed

On February 11 1947 in New York City the Chairman of the Council Committee on Public Health and Education and the Chairman of the Subcommittee on Cancer conferred with the Deputy Commissioner of Health and the Director of Cancer Control of the New York State Department of Health regarding a plan for having regional meetings of representatives of the State Department of Health, the Council Committee on Public Health and Education, the Chairman of the Subcommittee on Cancer, and the chairmen of cancer committees

of county medical societies. Twenty-seven lectures on cancer have been given in eleven counties including four teaching days. For a report of these activities see the report on Postgraduate Education These lectures which are

presented jointly by the Medical Society of the State of New York and the New York State Department of Health, have been well attended and received

Requests have been received from Broome and Queens County medical societies for Regional Cancer Teaching Days and arrangements are being completed

Hard of Hearing and the Deaf -The Subsemmittee on Hard of Hearing and the Deaf has the follow ing membership

Gordon D. Hoople, M. D., Chairman Syracuse C. Stewart Nash, M. D., Vice-Chairman, Roches-

Edmund Prince Fowler, M D New York Karl W Gruppe, M D Marvin F Jones, M D Utlca New York Harry K Tebbutt, M.D. Albany

A conference of the Subcommittee on Hard of Hearing and the Deaf and the Council Committee on Public Health and Education was held in New York City on January 8, 1947 Representatives of the State Departments of Health, Education, and Welfare were present as were some of the officers of the Medical Society of the State of New York. At the conference, the plan for the establishment and maintenance of conservation of hearing centers in strategic cities throughout the State was discussed.

During the past year a conservation of hearing center has been established in Syracuse. A similar center is in the process of formation at Buffalo and preliminary steps have been taken for the establish ment of a center in Utica. This will mean that within a short time each of the main cities of New York State will be serviced by a conservation of hearing center and in the metropolitan district by

more than one

Mental Hygiene.—The Secretary of the Medical Society of the State of New York received a com-munication dated August 30 1946 from Dr. W. W. Bauer Bureau of Health Education of the American Medical Association, regarding the following reso-lution passed by the American Medical Association House of Delegates at its July 1946 meetings Stateunds Mental Hygiens and Mental Diseass Pro-

gram WHEREAS there is an urgent need in most of the states for well-organized and adequately financed mental hygiene programs, for research activities in the field of mental diseases, and for improved institutional care of the mentally ill.

WHEREAS, the medical profession should give increased leadership and support to such activi-

ties therefore be it

Resolved That each state medical association be requested to take the lead in the development of an adequate state-wide mental hygiene and mental disease program and to cooperate with other groups in stimulating public support in order that sufficient funds may be secured for the proper operation and maintenance of such activities.

At the meeting of the Council of the Medical Society of the State of New York on September 12, 1946 it was voted that the President be authorized to appoint a committee to study the matter

At the meeting of the Council of the Medical Society of the State of New York on October 10, 1946 the following names were submitted as mem-bers of the Subcommittee on Mental Hygiene and approved

S Bernard Wortis, M D, Chairman New York Leslie A Osborn, M D John Romano, M D Harry A Steckel, M D Buffalo Rochester Syracuse

This is a Subcommittee under the Council Com-

mittee on Public Health and Education

On December 3, 1946, in New York, a meeting of the Council Committee on Public Health and Education and the Subcommittee on Mental Hygiene was held to consider matters pertaining to outpatient treatment of veterans with service-connected psychiatrıc disabilities under Veterans Medical Service Plan of New York, Inc Present at this meeting were the Secretary of the Medical Society of the State of New York and representatives of the New York State Regional Office of the Veterans Medical Service Plan of New York, Inc , and representatives of the Veterans Administration

The Subcommittee on Mental Hygiene of the Medical Society of the State of New York was represented at a meeting of the New York State Joint Legislative Committee to Study the Problem of Cerebral Palsy held in New York City on Decem-As a result of the discussion ber 12 and 13, 1946 at this meeting, the Committee prepared the follow-ing letter which was submitted to the Council of the Medical Society of the State of New York at a meeting on Feburary 13, 1947, and was approved

February 25, 1947

Honorable Abraham Schulman, Chairman Estate of New York
Joint Legislative Committee
to Study the Problem of Cerebral Palsy
The Capitol
Albany New York Albany, New York Dear Mr Schulman

Dear Mr Schulman

The Medical Society of the State of New York believes there is real need for additional familities for research and treatment for patients afflicted with cerebral palsy. While a considerable amount has been done in the past such as that of the Newark State School Newark, New York the government should increase its participation in the expansion of the research and treatment program throughout the State Such a program should have clearly defined standards for workers in this field which includes physicians, occupational therapists physiotherapists and special nursing aids. If the Medical Society of the State of New York, through several of its committees can be of further assistance please let me know

let me know

Sincerely yours, (Signed) O W H Mitchell, M D, Chairman

County Health Departments —At the request of the State Department of Health, a meeting of the Council Committee on Public Health and Education was held on August 14, 1946, in New York City, to discuss the expansion of the public health program of the State with particular emphasis on increasing of State financial participation in county health departments As a part of the Governor's health program, provision is made to increase the State subsidy from 50 per cent to 75 per cent for the first \$100,000, and 50 per cent for additional monies to simulate interest in establishing county health The Chairman of the Council Comdepartments mittee on Public Health felt that this had to do with planning and developing of policies and should be discussed with the Planning Committee of the Medical Society of the State of New York

Present at this conference were members of the Council Committee on Public Health and Education, some of the officers of the Medical Society of the State of New York, and representatives of the

New York State Department of Health

Homologous Serum Jaundice—A communication dated November 7, 1946, was received by the Chairman of the Council Committee on Public

Health and Education from the Assistant Commissioner for Medical Administration, New York State Department of Health, requesting the ap-proval of a proposed study by the Department to determine the incidence of homologous serum jaundice in patients who have been transfused with the dried blood plasma which is now being distributed throughout the State This plan was considered at the meeting of the Council Committee on Public Health and Education, and the Committee on Child Welfare on December 4, 1946, in New York Also present at this session were some of the officers of the Medical Society of the State of New York and representatives of the State Department of Health ' The group approved the plan and recommended that the Department prepare a report form to be approved by the Committee At the meeting the Council Committee on Public Health and Education and the Committee on Child Welfare on January 8, 1947, in New York, the Department submitted the form which will be sent to the attending physician for information about hepatitis and jaundice in anyone that has received injections of their plasma products This form was approved by the Committee

BCG Immunization —BCG immunization was discussed at a meeting of the Council Committee on Public Health and Education and the Committee on Child Welfare held in New York on January 8, 1947 At this conference some of the officers of the Medical Society of the State of New York and representatives of the New York State Department of Health were present. It was proposed that B C G vaccine be used as a part of the Tuberculosis Control Program in New York State. It was the opinion of those present that an education program for the medical profession be inaugurated Also, it was recommended that letters be sent to the deans of the nine medical schools in New York State requesting the names of members of the faculties who were interested in or who had had recent experience with BCG immunization

On February 12, 1947, the Council Committee on Public Health and Education held a conference in New York City to consider an educational program in B C G immunization as a part of the Tuberculosis Control Program in New York State Present at this meeting were some of the officers of the Medical Society of the State of New York, representatives of the nine medical schools in New York State, and representatives of the New York State Department After a thorough discussion of the procedure, it was recommended that an advisory committee be appointed by the New York State Department of Health and the Medical Society of the State of New York, to work out a plan whereby instruction would be available for those who are to be in charge of the immunization and for county medical societies, hospital staffs, and other medical groups This recommendation was presented to the Council of the Medical Society of the State of New York at a meeting on February 13, 1947, and was approved

PART V

Rural Medical Service

The Committee on Rural Medical Service was formulated in November, 1945 Dr Dan Mellen, of Rome, was named Chairman of the Committee and serving with him were Dr Homer J Knickerbocker, of Geneva, and Dr Edward P Flood, of the Bronx.

The Committee is available for conference with the American Farm Bureau Federation and all other farm organizations since all planning for im provements in rural health must have the benefit of the experience and advice of the organized medical profession Inquiries have been few and prob-lems no more than would be normally expected. The Committee on Rural Medical Service has been working with the Committee on Veterans Postwar Affairs in filling vacancies in rural communities So far, the problems of rural medicine in New York State have not been great.

Dr Mellen and Dr Flood attended the National Conference on Rural Health which was held at the Palmer House in Chicago Illinois, on March 30, 1946 The Conference was for the purpose of bettering medical care in rural areas. It was a splendld meeting and nearly every state was repre-

Program. For report of these activities, see the report of the

Committee on Maternal Welfare

At the request of the New York State Department of Health meetings of the Subcommittee on Rehabilitation were held in New York City on January 8 and February 13 1947, to consider the fee schedules for diagnostic and consultation examination and surgical procedures of the Bureau of Medical Rehabilitation, State Department of Health, and the Division of Vocational Rehabilita tion of the State Education Department. Present at these conferences were representatives of the State Department of Social Welfare, the group of physicians who were designated as advisors by the Medical Society of the State of New York, and some of the officers of the Medical Society of the State of New York.

As in previous conferences, there was splendid cooperation between the representatives of all agen-

cies concerned.

PART VI

Public Relations and Economics

The Council Committee on Public Relations and Economics has the following membership

Carlton E. Wertz, M.D. Chairman Harry Aranow M.D. Buffalo Bronx Charles M Allaben, M.D. Binghamton The Committee submits the following report

Public Medical Care

The Subcommittee on Public Medical Care has the following membership

Christopher Wood, M.D., Charman White Plains Carlton E. Wertz M.D. Buffalo Charles F. Rourke, M.D. Schenectady Howard P. Webb M.D. Utlea

Under the very able chairmanship of Dr Ralph T B Todd, the Subcommittee on Public Medical Care, in addition to its consideration of various welfare policies and problems, spent well over a year studying in detail and revision upward the schedule of reimbursable charges of the State Department of Social Welfare In the latter part of 1946 your present Committee reviewed and approved this schedule and then presented it to the Council. The Council in granting its approval made two stipulations. First, the schedule does not represent the full value of the medical services given and second, the difference between this schedule and the full value represents each physician a contribution to needy persons of the State

In November 1945, cloven county and city Com missioners of Public Welfare, and seven physicians serving as consultants or directors of local welfare plans were appointed to work with your Commit-tee and the State Department of Social Welfare, the whole group forming what has since been termed the Joint Committee with membership as follows

New York State Department of Social Welfare

Harry O Page, Deputy Commissioner Peter F Birkel, M D, Medical Director Miss Marion Rickert, Medical Social Work Supervisor

Stella M Dorsey Senior Medical Social Worker

Association of Public Welfare Officials

Ralph G King, Chairman Essex County Ruth Taylor, Westchester County Roy Newcomb Eric County George H Peet, Lockport City Elmer G Butts Wayne County Charles G Burnett, Steuben County Percy W Woodruff Chemango County Leon H Abbott, Onondaga County Robert Campbell, Nassau County James H. Robinson, Binghamton City Carroll M Hall, Jamestown City

Local Welfare Medical Consultants or Directors

Dorothy Grey, M.D. Allegany County Depart-ment of Public Welfare Leo Reimann, M.D. Cattaraugus County Depart-ment of Public Welfare

ment of Public Wellare
O Millon Meeks, M.D Nassau County Department of Public Welfare
John Sassani, M.D Blinghamton
Robert H. Gray M.D. Westport
Robert S Cleaver M.D. Brewster
Anthony A Mira, M.D., New York City Department ment of Welfare

Medical Society of the State of New York

Carlton E. Werts, M.D. Buffalo Howard P. Webb. M.D., Utlea Charles F. Routke M.D., Schemeotady W.P. Anderton, M.D., New York Christopher Wood M.D., White Plains

The geographic distribution of this enlarged joint committee insures much more precise information and discussion regarding local procedures and problems. It also provides at any given meeting a considerable proportion of medical viewpoint and opinion.

The new schedule of reimbursable charges was formulated after study of insurance plan fee schedules for the low income group, and represents approximately two thirds of the Workmen's Compensation Minimum Fee Schedule. In some surgical procedures, the reimbursable charges included after-care only while in hospital and provide payment for services rendered in the office or home, rather than including two, three, or more weeks of after-care as in the Compensation Fee Schedule

In discussing the new schedule of reimbursable charges, a number of points should be noted. The schedule of necessity embraces the State as a whole, it cannot be varied to accommodate innumerable local conditions and circumstances. It is a schedule of charges of which the State will reimburse 80 per cent to the locality. Therefore, on each dollar spent locally the State pays eighty cents and the locality expends twenty cents of its own tax funds. Nothing whatever in this schedule prevents higher fees being paid locally if the Commissioner of Public Welfare can be persuaded to recommend, and the Board of Supervisors persuaded to authorize, increased expenditure of local tax funds.

The State Department of Social Welfare is willing to establish a schedule at the highest rates possible, consistent with available funds, the present schedule will remain in effect until December 31, 1947, and revision can be sought after that date. It should be pointed out that these are rates for services rendered to persons with little or no income, the indigent and the medically indigent, and the medical profession has always varied its fees accordingly However, it should also be pointed out that the same type of medical care is rendered to rich and poor alike, the physician giving similarly to each of his time, thought, energy, and experience, his work with one having in actuality the same worth as his work with the other Furthermore, the provision of sufficient and proper medical care at adequate fees will reduce the hospital and chronic care costs, and increase the number of persons capable of partial or complete self-support

Considerable adverse comment and criticism have appeared concerning the forwarding of payments for medical services directly to the patient, who in turn is supposed to remit these payments to the physician. This procedure is a requirement of the Social Security Board and must be followed if the State is to receive reimbursement from Federal funds. However, efforts are being made in various quarters and in various States to have this requirement rescinded.

Your Committee feels that tremendous progress has been made in developing public medical care programs under the New York State Social Welfare Law

It has been established beyond question that the medical aspects of medical relief should be supervised by the medical profession. The New York State Department of Social Welfare and the Association of Public Welfare Officials are as sincerely desirous as we are of obtaining and maintaining the best possible quality of medical care. An article emanating from the Joint Committee, outlining the present status of public medical care in New York State, has been prepared and will be published in the New York State Journal of Medicine as soon as space can be secured. Your Committee strongly urges that similar cooperative efforts, now existing on a State level, be established with Welfare Officials in each local welfare district

During the coming year, your Committee will continue its efforts to obtain effective working relationships among all who participate in medical care programs. A further goal is the preparation of a new Manual of Medical Care—unchanged since the days of T E R R A.—embracing the philosophy, standards, and practices of the total medical welfare program in New York State

The Committee has held two meetings August 15 in Buffalo and November 20 in Syracuse

The Committee outlined its program at the August 15 meeting and the following matters were discussed and acted upon

We recommended a uniform contract on a statewide basis, preferably an inhospital, medical-surgical plan on an indemnity basis, and recommendation was made that counsel be consulted and after study and further consideration, the matter again be placed before the Committee for discussion

Mr George P Farrell, Director of the Bureau of Medical Care Insurance, submitted a standard report form to be used by all medical care plans in the State for reporting enrollment, premium income, and claim expense. The Committee suggested that copies of this form be sent to each plan in the State for their information and individual action. Mr Farrell also suggested that copies of these reports should be filed with the Bureau of Medical Care Insurance quarterly.

The following public relations program was discussed and recommendation was made that the Bureau conduct this program personal appearances by the Director, releases in county medical society bulletins, New York State Journal of Medicine, and other means of publicizing medical care insurance was suggested, as well as the cooperation of the Woman's Auxiliary in arranging programs. The Committee felt that a program of this nature would be helpful in creating public and professional interest

Reciprocity between New York State plans was discussed in detail. It was deemed advisable to obtain regulations from each plan on reciprocal policies and recommendation was made that this

Information be obtained by the Bureau
On invitation, the New York State Insurance Department has sent to each meeting representatives, namely, Mr William C Gould, chief of the Mutual and Fraternal Bureau, and Mr Victor Cohen, chief of Policy Bureau The Committee unanimously feels that a working relationship with the State Department of Insurance has been established and should be continued and that their help and guidance will be of inestimable value in the Committee's program.

At the November 20 meeting directors of New York State medical care plans were invited to attend The meeting was devoted largely to an informative discussion of Associated Medical Care Plans, an organization formerly known as Medical Service Plans Council of America, which is an association of voluntary prepaid medical care plans throughout the United States, approved by state medical societies and whose purpose is to seek joint action by such plans on a national scale and to be closely coordinated with the activities of the Council on Medical Service of the American Medical Associ-Benefits of affiliating with this national association were discussed and additional information was brought to the attention of directors of New York State plans It was revealed that state society approved plans, underwritten by commercial insurance companies were acceptable by Associated Medical Core Plans for membership The directors expressed disfavor of this policy No recommendation or action was taken regarding New York State plans affiliating in Associated Medical Care Plana.

Informative papers on problems encountered in administering medical care plans changes in con tracts, public reaction to new plans and reciprocity were presented at the November meeting by direc-tors of the various plans. The Committee wishes to express its appreciation to the directors for their cooperative efforts in preparing the papers. A recommendation was made that abstracts of the papers be published in the NEW YORK STATE JOURNAL OF MEDICINE

The Committee recommends through the Coun cil Committee on Public Relations and Economics that the Medical Society of the State of New York establish standards of acceptance for approval of nonprofit voluntary medical care plans in New York State.

The Committee wishes to express its thanks to the officers of the Society for their interest and attend

ance at meetings.

Bureau of Medical Care Insurance.—The Bureau of Medical Care Insurance George P Farrell, Direc-

tor, reports as follows

The activities of the Bureau have been carried on under the direction and recommendations of the Subcommittee on Medical Expense Insurance of the Council Committee on Public Relations and Economics.

In carrying out the public relations program, Mr Farrell has prepared papers on the various aspects of medical care insurance and has appeared before five county medical societies, six Woman s Auxiliary groups, and twelve women a club and civic organisations throughout the State On invitation of Dr O W H. Mitchell, Chairman of the Council Committee on Public Health and Education of the Medical Society of the State of New York, papers on 'Voluntary versus Compulsory Health Insurance' were presented before the senior students of

the Syracuse University College of Medicine Releases on the activities of the Bureau have been published in the New York STATE JOURNAL OF

MEDICINE and county society bulletins

A pamphlet entitled Check and Double Check on Sickness Insurance, prepared by outside sources and compiled in question and answer form, has been released through the Public RelationsB ureau of the Medical Society of the State of New York. pamphlet has been widely distributed and will bring to the public a clear picture of the advantages of a nonprofit voluntary prepaid insurance system as compared to a compulsory program.

A questionnaire regarding reciprocity arrangements between New York State medical care plans

has been prepared and submitted to the following

United Medical Service, New York, Western New York Medical Plan, Buffalo, Genesco Valley Med! cal Care Plan, Rochester Central New York Medical Plan, Syracuse, and Medical and Surgical Care, Inc., Utica. The plans agreed to accept a transferred subscriber and allow credit accrued un der original contract for waiting periods toward all limitations, under new contract to be issued also, they will allow a subscriber to apply for any type of contract being currently offered by the plan and will accept a subscriber from an out-of-state medical care plan which reciprocates.

Waiting periods for maternity benefits will be credited from date of original contract on transferred members, provided the original contract

offered this service

The Genesee Valley Medical Care Plan reserves the right to reject or make an exception for any physical condition which existed at the time of enroll ment in the original plan.

This agreement among nonprofit voluntary plans in the State is a definite advantage to its 600 000 members in having the guarantee of continued mem

bership and protection without penalties

Mr Farrell as a member of the Liaison Committee with Veterans Administration has attended stated meetings. He has also attended District Branch meetings, the American Medical Association House of Delegates, the Council of Medical Service of the American Medical Association, Associated Medical Care Plans, the Third Semi annual Meeting of the Middle Atlantic States Regional Conference of the American Medical Associa tion Council on Medical Service, as well as New York State Insurance Department conferences, medical care plan directors' meetings, and other groups

Descriptive literature has been obtained from New York State plans and other plans throughout the United States for study and comparison pur poses. The Bureau is currently engaged in this study and complete survey report will be published

at a later date

The standard reporting form referred to in the Committee's report has been mailed quarterly to the plans and a recapitulation of the information received reveals an accurate picture of the progress of each plan This information will be compiled by the Bureau and distributed to all plans which will enable them to study the experience and progress of other plans. This information will help plans to proceed on a sound underwriting basis

Mr Farrell spent a considerable amount of time with the officers and special committees of the Western New York Medical Plan, analyzing their experience and on invitation of the Northwestern New York Medical Plan, Albany and Genesee Valley Medical Care Plan Rochester, has consulted with them on several occasions during their forms.

tive periods.

We are including in this report a progress report of the New York State plans as follows

The total increase in enrollment during 1946 in The total increase in enrollment during 1949 in New York State plans was 329 794, or 122 per cent Total membership (subscriber and dependents) as of December 31 1936 was 508,042, which exceeded by approximately 20 per cent the estimate made by the Bureau in last year s report.

There was an increase of 317,880 members or 118 per cent, in the following four plans which have been in operation for one year or more prior to January 1 1940 United Medical Service New York City Western New York Medical Plan Buffalo Medical and Surgical Care, Inc., Utica, and Cen-

tral New York Medical Plan, Syracuse

The Genesee Valley Medical Care Plan, Rochester, issued its first contracts August 1, 1946, and had a membership of 11,914 as of December 31, 1946 The Northeastern New York Medical Service, Inc, Albany, started active operation early in

At present Chautauqua County is considering forming its own plan, and Jefferson County is considering becoming an affiliation with Medical

and Surgical Care, Utica

The Blue Cross Hospital Plans promote and administer both the hospital and medical care plans and the following is a comparison of the increase in membership in both plans during 1946. The medical care plans have been operating a year or more prior to January 1, 1946

	Hospital Plans	Medical Plans
United Medical Service, New York City	585,555	244,164
Western New York Medical Plan, Inc., Buffalo Medical and Surgical Care,	54,412	39,221
Inc, Utica Central New York Medical	27,890	27,687
Plan, Inc , Syracuse	41,829	6,808
Plan, Inc , Syracuse	41,829	

These comparative gains are particularly significant in view of the fact that the total medical plan membership is 16 428 per cent of Blue Cross membership in the above plans as of December 31, It is evident that there is a potential field to increase membership in the voluntary prepaid medical care plans

It is gratifying to note that the doctors are cooperating and supporting the plans to foster adequate medical care under voluntary plans present time, approximately 70 per cent of all practicing doctors are participating in the plans within

the State

During 1946, all plans in New York State had an earned premium income of \$3,100,444, with incurred claims in the amount of \$2,009,869 As of December 31, 1946, the surplus, including statutory requirements, was \$868,796

It is reasonable to expect from 1946 experience that enrollment will reach 1,000,000 members by

January 1, 1948
Mr Farrell wishes to express his appreciation to Mrs Alfred L Madden, President of the Woman's Auxiliary, and Mrs Michael M Schultz, Program Chairman, for the excellent work carried on by the Woman's Auxiliary in arranging programs on

medical care insurance

The Bureau also wishes to express its thanks to Dr Carlton E Wertz, Chairman of the Council Committee on Public Relations and Economics, to Dr A H Aaron and his Committee for the help and cooperation it has received, and, to the Public Relations Bureau and the New York STATE JOUR-NAL OF MEDICINE for their assistance during the past year

PART VIII

Veterans' Affairs

The Council Committee on Veterans' Affairs was established in June, 1946, superseding the War Participation Committee which was dissolved fol-lowing the close of the war Membership is as lowing the close of the war Drs Dan Mellen, Chairman, Rome, follows

William F MacFee, New York City, James F

Rooney, Albany
The Committee's function was to continue part
of the activities of the War Participation Committee in aiding medical officers to re-establish themselves in civilian locations

A comprehensive questionnaire was sent to county medical societies throughout the State, requesting information as to the number of physicians in practice, opportunities for additional physicians, housing and office facilities, and general information which would be helpful in the Committee's program Returns were favorable but data received was not sufficiently uniform for tabulation It was valuable, however, in answering inquiries

Over 300 interviews with medical veterans have been held at the offices of the Society, and many

mail inquiries answered

In November a letter was sent to the secretaries of the county societies expressing appreciation for their cooperation in the Committee's work and requesting final data on opportunities for physicians in the smaller communities Replies have been received from all but a few counties They contained information useful in answering inquiries about rural openings

Inquiries have decreased to such an extent that activities are about closed Results of the Committee's work, as evidenced by the reactions of those who sought help, have been gratifying The Committee recommends that it be dissolved and further

inquiries answered by the Secretary

The Committee wishes to express its thanks to those in the Society office for their help and cooperation in carrying out the Committee's program

Liaison with Veterans Administration

The Council Committee on Liaison with Veterans Administration has the following membership

Herbert H Bauckus, M D , Chairman, Buffalo Louis H Bauer, M D Laurance D Redway, M D W P Anderton, M D Edward R. Cunniffe, M D J Stanley Kenney, M D Dan Mellen, M D' George P Farrell, Esq

This Council Committee was appointed to prepare for the administration of some plan to render medical care to veterans with service-connected or

service-aggravated disabilities or disease

Early in 1946, the committee went to Washington, DC, and there met Maj Gen Paul R Hawley, MD, chief medical director of the Veterans Administration, and Colonel Harding, directly in charge of medical care At this meeting there was a general discussion of ways and means and final objectives to be obtained in giving private medical care to the veteran

On May 21, in New York City, the committee met with representatives of the Veterans Administration, Dr Lyman C Duryea, medical director, Dr F E Lane, chief outpatient division, Mr Williams liam Fredericks, assistant director of finance, Mr Emmett F Good, assistant solicitor, legal division, and Mr William Duff, field division, public relations Dr Duryen stated that the Veterans Administration wanted to see a plan put into effect which would be federally controlled, and doctors' fees paid by the Administration through the Comptroller General's office, clinics to be established throughout New York State where patients would receive initial examination to determine eligibility

for treatment, and two treatments. He then would be referred to a private physician or specialist for further treatment

An alternative plan was suggested whereby the patient be given an identification card at the clinic inting his service-connected disabilities certifying his eligibility to obtain medical care, with free choice

of physician
The members of the Linison Committee felt that the most satisfactory medical care would be under medical society control, payment of fees being by number of visits according to a fee schedule plan was that the veteran visit the physician of his choice, fill in a blank form furnished by Veterans Administration to physician such completed form to be sent to a Regional Office of Veterans Administra If sufficient information were tion for adjudication given on the blank, adjudication could be made immediately, if more information were needed the veteran would be examined at clinic, and when adjudication was established an identification card would be given the veteran with a listing of disabili ties and authority for further treatment.

Following this meeting and embodying the policies suggested by the members of the committee the Veterans Administration submitted a new plan to the committee and with certain additions and correc

tions it was accepted
The Lasson Committee, at special meetings in various cities of the State, met with groups of specialists in the profession for consideration of a proper fee schedule. In these discussions impor tance was attached to the Workmen a Compensation Fee Schedule of New York State and the fact that the profession in general thought that the present Workmen's Compensation Fee Schedule was in adequate. The present fee schedule now in use adequate. The present fee schedule now in use with the Veterans Administration is the result of with the Veterans Administration is the result of these deliberations and the schedule has, of course the approval of the Veterans Administration

The Lanson Committee also adopted a means of designating specialists, and the specialists are designated by one of four means. They are physiclans who have certificates from the various Na tional Specialty Boards, those who are Fellows of the College of Physicians, or Surgeons, and also those who meet the standards set up by their county committees for qualification under the Workmen's

Compensation Law of New York State

The Veterans Administration felt that it would like to deal with New York State as a separate unit. In order to elect a contract it was necessary to set up a membership corporation in New York State which would represent the medical profession. Ac cordingly, the Veterans Medical Service Plan of New York State Inc. was formed and it was this organization that made the contract with the Veter ans Administration

This joint agreement was signed August 7 1946 On September 16, 1946, the Plan began its work under these auspices. The Lusison Committee has had numerous meetings during the year and its last meeting prior to this report was on February 18

1947

At these meetings the various problems brought out by the actual working of the Plan are discussed and to the meeting are invited the Board of Directors of the Medical Service Plan and various officers of the Medical Society of the State of New York. In a supplemental report of the Veterans Medical Care Plan to be submitted at a later date, we hope that there will be statistics of the work done during the first six months of the Plan

It should be noted that in the administration of

this medical service the county medical society is of great importance. The county medical society keeps a lust of its physicians and specialists for the use of the authorising physicians of the Veterans Administration and in every way has been encour aged to watch closely the developments of the Plan The authorizing physicians are located in each Re-gional Office of the Veterans Administration and at several contact offices located throughout the State. It should be noted that the decision for authoriza tion is made by the physicians employed by the Veterans Administration

The Lasson Committee has reported regularly through the Council and has secured approval of the Council on all the important measures it has

At each Regional Office there is a coordinator who is a physician employed by the Veterans Medical Service Plan This coordinator reviews the medical reports and must make final approval of the services rendered before they are paid for by the Finance Department of the Veterans Administration.

The committee is much indebted to Frederick E Lane, M D, director of the Outpatient Department for New York State, for his cooperation and for his regular attendance at the various conference

meetings.

PART IX

Legislation

The Council Committee, charged with the duty of studying legislation and putting forth the post tions taken by the Society consists of the following

Harry Aranow M.D., Chairman Walter W. Mott. M.D. Bronz White Plains Leo F Simpson M.D. Rochester

The Council Committee on Legislation respecfully submits the following preliminary report. This report is a preliminary report in so far as the Legislature [at the time of submitting this report] is still in session and will not adjourn until the latas ten in seem and with not sujourn and the lat-ter part of the month. There has been very little action taken on the part of the committees or the Legislature on the bills in which we are interested

up to the date of this report

As there was an election last fall, there has been a large number of changes in the members of the Legislature both in the Senate and in the Assembly There are many new members. There is a much larger Republican majority in both houses than heretofore. It was apparent that with this Re-publican majority and a Republican governor the program favored or sponsored by the Republican party would be carried out without any difficulty, in spite of the efforts that would be made by the minority members of the Legislature. The resuits of legislation so far this year have shown that what was anticipated along this line is being carried through There has been on the part of the minority members a tendency to introduce bills that would be controversial or embarrasaing to the majority This of course, is part of the game of politics. It has resulted in the introduction of a very large number of bills this year To date there have been 5,200 bills introduced in both houses, If this is not a record, it is a near record. Among this large number of bills there has been quite a number in which it was thought the members of the medical profession would be interested These have been reported to the members of the profession and the county societies through the bulletins issued by the Committee on Legislation As mentioned above, however, at the time of this report there has been very little action on these bills either in the committees to which the bills have been referred or on the floor of either house. In the supplementary report further information will be given on the bills which we have followed and the final action on these bills.

At the beginning of this legislative session it was not known just what type of legislation we would have to be prepared for, either in the way of support or opposition It was thought that there would be a bill for the licensure of the practice of chiropractic, but it was not known just what type of bill would be introduced — It was also thought that there would be some bill introduced to prevent vivisection, but there was no evidence that a strenuous effort to pass such a bill would be made It was anticipated from the democratic platform in the campaign of last fall that one or more bills providing for State compulsory health insurance would be introduced Another bill which was looked forward to this year was the bill that would revise the Education Law generally This bill has been introduced and further comments on it will be made below anticipated, also, that there would be bills introduced to amend the laws governing the practice of medicine in connection with workmen's compensation, health insurance, partnerships, group practice, and the practice of specialties in the field of medicine Such bills have been introduced and they also will be

commented on in this report The anticipated bill for the licensure of the practice of chiropractic was introduced late in the session The first bill, Senate Int 1464—Santangelo, Assembly Int 1759—Noonan, was introduced on Tuesday, February 11 Rumor had it early in the session that there would be two chiropractic bills introduced this year This rumor was verified on Wednesday, February 19, when a second bill for the heensure of chiropractic was introduced by Senator Seelye (Senate Int 1839) and in the Assembly by Mr Coville (Assembly Int 2012) On the same day that the bill was introduced by Senator Seelye, the bill introduced by Senator Santangelo was acted on in the Senate The action of the Senate at that time was to discharge committee and strike out the enacting clause This wo This would indicate rejec-The companion bill in the Assembly so far has not been reported out This action would indicate that efof committee forts will be made to pass the Seelye-Coville Bill The Seelye-Coville Bill does not set up standards for heensure for the practice in the healing arts which the medical profession could support for any school or cult The medical profession is interested in this legislation as a matter of protection to the Our interest lies in the protection of the public from the standpoint that anyone given the privilege of diagnosis and treatment should have sufficient scientific training and background to insure safety to the public in such matters The requirements for admission to licensure in this bill do not meet the requirements which the medical profession considers safe for the public It would permit the examination of those now practicing by a board of five members appointed by the Board of Regents, all members of this board to be chiropractors This board of five members would license any present practitioner of chiropractic who meets the requirements in regard to age, moral character, citizenship, residency for one year in New York State, and is a resident course graduate chiropractor, after a spe-

cial examination by this board in the principles and practice of chiropractic There is no requirement. for a thorough examination in the basic scientific subjects bearing on the practice of the healing arts The Committee on Legislation, in conjunction with the Public Relations Bureau of the State Society and Mr Dwight Anderson, its Director, are endeavoring to bring a strong opposition to the passage of this bill The Public Relations Bureau, on being informed that a chiropractic bill had been introduced, immediately got out a News Letter on this subject, reprints of the article that appeared in Hygera, later condensed in the Reader's Digest, entitled "Can Chiropractic Cure?", a leaflet entitled "Urgent" giving the basic arguments against the passage of this bill, and post cards entitled "Voter's Ballot," in large numbers Mr Thomas E Walsh and Mr Edgar L Cook, working with Mr Dwight Anderson, Director of the Public Relations Bureau, are traveling through the State distributing this material to the legislative committees and officers of the county societies for the use of the medical profession and their friends in opposing this legislation At the time of this report these bills have not been reported out of committee It is hoped that sufficient opposition will be registered with the chairmen and members of the committees concerned and the legislators in both houses—to prevent these bills from being reported out of committee and any action taken on them.

Up to the time of this report no bill has been introduced which would prevent scientific experiments or tests on living warm-blooded animals, or dogs. As the date for the introduction of bills has passed, it is not anticipated that such a bill will be introduced this year. There has been a bill introduced in the Senate by Senator Young—Senate Int 1904 (Assembly Int 2290—Stuart)—which would amend the Penal Law that such scientific tests on living animals shall be conducted in laboratories or institutions approved by the State Health Commissioner, subject to standards fixed by the Commissioner and inspection of such laboratories by the Commissioner The attitude of the State Society on this bill has been that although it did not entirely approve the introduction of this bill, it would not oppose its passage

As anticipated, a bill was introduced this year to set up in the Health Department compulsory health insurance. This bill, similar to one that has been introduced for several years, would establish the same type of compulsory health insurance as the Wagner-Murray-Dingell Bill proposes for the whole country. The bill is Assembly Int. 493—Farbstein It has not been reported out of committee and it does not appear that it will progress this year. Last year a similar bill was introduced by Assemblyman Farbstein in the Assembly and by Senator Corcoran in the Senate. A strong fight to bring the bill out of committee was defeated in both houses last year. It is called to your attention that it remains necessary for your Legislative Committee to watch such attempts at this type of legislation and make its representation against it.

The Legislature, in the 1940 session, adopted a concurrent resolution creating a joint legislative committee to investigate, review, and study problems involving the education system of the State This committee has been known as the Joint Legislative Committee on the State Education System, and also as the Coudert-Rapp Committee It has been continued from year to year and will be continued for another year This committee has made a study of the whole Education Law, the primary

object being to recodify and bring up to date the Education Law, correcting errors removing obsolete portions, etc. There has been a completely new system of indexing and numbering the articles and sections under the Education Law Several times this last year members of your Legislative Committee, the Medical Practice Committee and the Committee on Licensure of the State Society have met with members of this committee and their associate counsel to consider these portions of the law pertaining to the practice of medicine. The Executive Officer sat in on the final hearing on the section of the law pertaining to the practice of medi-cine before the bill was drawn up amending that section A bill amending the Education Law gen erally was introduced on Friday, February 7 by Senator Griffith in the Senate (Senate Int 1301) and in the Assembly by Mr Milmoe (Assembly Int This bill as introduced is a large volume, approximately 23/4 inches thick and containing 1 275 pages. At the meeting with the associate counsel of this committee it was brought out that there was no intention of making any substantive change in the Education Law and that any controversial matter would not be included in the amendments, as this bill amends the Education Law so generally that if any controversial changes were attempted as amendments, the opposition would endanger the passage of the bill as a whole. It was for that rea son that several of the amendments which members of the State Society would like to have seen made, could not be included in the amendments proposed in this bill. The members of the State Society committees agreed with the associate counsel and members of this committee on the amendments proposed in this bill. If this bill is passed and is enacted into law the article governing the practice of medicine will become Article 131 in stead of Article 48 as in the present law and will be entitled Medicine, Ostcopathy Physiotherapy The sections will be Section 0501 through Section 6517 inclusive, instead of Sections 1250-1266 as in the present law This bill has already been passed in the Senate and it is thought that it has an excellent chance of passing the Assembly and being signed by the Governor The State Legislative Committee and the County Legislative Chairmen have expressed themselves as being in favor of the passage

Your Committee on Legislation has also been interested in a number of bills affecting workmens compensation It has been working with the Chairman and Director of the Workmen's Compensation Bureau in regard to the bills that have been hatroduced amending the Workmen's Compensation Law Our opposition has been made known concerning the bills to which we are opposed and support given the bills which the members of the Society and the Workmen's Compensation Bureau favor The same has been true in regard to bills that would amend both the Workmen's Compensation Law and the Education Law in regard to partnerships and group practice. There has been an expression of opinion on the part of many of the officers and members of the State Society that it was desirable to amend the Workmen's Compensation Law and the Education Law to permit the practice of medicine by partnership and group practice. It has been difficult, however to get bills proposing such amend ments that were considered proper bills and that would not permit undesirable practice under such amendment to the law At the meeting of the County Legislative Chairmen this year, discussion

centering on this subject brought out the expression that in so far as we have not been able to accomplish what we wished along this line, it may be necessary for us to support bills that may not be wholly satisfactory at this time, with the idea of correcting any abuse by future legislation, should such abuse occur. At this meeting it was voted to support the Turshen Bill, Assembly Int. 893, which would amend the Education Law and provide that restrictions on splitting fees in the practice of medicine shall not forbid or render illegal, partnership of physicians maintaining common office nor division of profits between members if partnership certificate is filed. This bill also prohibits a physician being a partner in more than one partnership

Your Legislative Committee and the legislative chairmen of the County Society Committee also voted to support the Clancy Bill, Assembly Int. 1283 which defines x ray diagnosis and prohibits any person other than a medical practitioner, dentist, or podiatrist from diagnosing fluoroscopic or registered shadow of any part of the body, or from using x-ray or radium for treating human ailment.

Your Executive Officer at the request of the Medical Grievance Committee and on approval of the Legislative Committee obtained the introduction of a bill which would authorize revocation, suspension or annulment of license and registration of a medical practitioner for newspaper advertising for patronage or for addiction to the use of narcotic drugs. This bill was introduced by Senator Grif fith in the Senate and by Mr Milmoe in the As-

sembly, at our request

The Committee on Legislation and the legislative charmen of the County Societies have registered strong opposition to the three bills amending the Education Law, introduced in the Scnate by Senator Griffith and in the Assembly by Mr. Milmoe which if enacted would permit physicians to practice as partners and to pool fees, and also permit insurance companies to contract with license physicians to practice on their behalf for persons insured under their contracts or policies, or such partners or groups of physicians to make such contracts. The objections to these bills were not on the ground of the group practice or partnership practice, but on the ground that this would establish more or less the corporate practice of medicine which was thought to be very undesirable from the angle of the profession and a danger to the public in regard to good medical practice.

There has been an attempt on the part of the Legislative Committee to obtain legal recognition of certain specialties as the practice of mediene which may only be performed by duly licensed physicians. The specialties which were being considered are the practice of x my, anesthesia, physiotherapy, and pathology Some progress can be reported along this line this year but not as much as was hoped for Further efforts will be continued next year.

The date of adjournment of the Legislature has not been fixed at the time of the writing of this report. It has been suggested that the Legislature will probably adjourn on Saturday March 22. As there has been very little action on the bills in which we are interested up to this time it is anticipated that during the remainder of the month of March and until final action is taken on the large number of bills in which we are interested it will be a busy time. It will be necessary then to give further information and final action in a supplementary report.

PART X

Workmen's Compensation

The Council Committee on Workmen's Compensation, consisting of Dr Maurice J Dattelbaum, Chairman, Dr Joseph P Henry, and Dr Dan Mellen, submits the following report of its activities from March, 1946, to February, 1947 A supplementary report will be submitted to the House of

Delegates in May, 1947 *

There has been close cooperation between the Bureau and the county medical societies. We have recommended that there be regular meetings of the county compensation committees to carry out the functions devolving upon them, viz, the qualification of physicians, inspection of employers medical bureaus annually, passing on applications for physicians and employers medical bureaus, disciplinary control and questions relating to professional ethics and medical competence in compensation cases. In the cities and large counties we have recommended the setting up of joint committees of physicians and insurance or employers' representatives to discuss compensation matters. These groups have served to lessen the number of formal arbitration proceedings and to establish good will

The Council authorized the Workmen's Compensation Bureau to cooperate with the Council on Industrial Health of the American Medical Association in the establishment of a state-wide industrial placement bureau. Thus far the AMA has taken no specific steps to bring this worth-while project

ınto being

Medical Society Participation -A number of county medical societies employ full or part-time executive, legal, and clerical help at considerable expense to maintain and operate their workmen's compensation bureaus or offices In the smaller societies the Workmen's Compensation Commit-In the smaller tees, the Comitia Minora, and the secretaries perform the functions delegated by the Workmen's Compensation Law As the interest of the societies in workmen's compensation matters and the number of problems related to this work have increased, it has become increasingly difficult to meet the needs of the societies without some increase in help, either full or part-time Undoubtedly, the participation of the medical profession in the administration of the Workmen's Compensation Law has been of substantial benefit to the public, and has lessened the load on an already overburdened Work-men's Compensation Board This has resulted in a great saving of money to the State and to the insurance carriers and self-insurers who pay the cost of administration of the Workmen's Compensation Board, but it has placed a burden of expense on the State and County medical societies which they have met with little thought of reimbursement

Coupled with the functions assumed under the law are services rendered to the profession by the State Bureau and by the county compensation committees which may in these days of increasing cost require reimbursement from those who derive material benefit from the treatment of compensation claimants. This question must be studied in connection with the over-all costs of running the medical society, and budgets will have to be met by an increase in county or State dues or by other means

The income to physicians from compensation

work will amount to over twenty-five million dollars, perhaps nearer thirty million dollars, in 1947. The proposed increase in compensation fees would materially increase the amount. The problems arising between doctors and carriers and employers and hospitals or with the Workmen's Compensation Board require executive, administrative, and clerical help and adequate space if the interests of the profession are to be safeguarded and our relationship with the "interested parties" kept on a high level of cooperative good will

A report on each month's activities was submitted to the Council and published in the NEW YORK STATE JOURNAL OF MEDICINE In the course of the year, hundreds of communications have been sent to physicians and county medical societies in relation to compensation matters and five official bulletins have been issued. These referred to (1) the amendment of the Workmen's Compensation Law making it unnecessary to notarize C-4 reports and the need for prompt and accurate reporting, (2) publication of a letter from the Chairman of the Workmen's Compensation Board authorizing physicians and specialists to use x-rays in diagnosis and treatment despite the provisions of bection 13-c 2 limiting the payment of fees for x-ray services to radiologists, (3) a bulletin in relation to the coverage of domestic workers in cities of 40,000 or over, (4) report forms—advising the profession of the need for care in the use of forms and deter-mining the needs of the local societies for distribution to physicians, (5) the need for meticulous care in qualifying physicians and specialists and the necessity of maintaining accurate and up-to-date lists of authorized practitioners and specialists and offering the aid of the Bureau in this work

Joint Medical Conference Committee —A meeting of the Joint Medical Conference Committee was held on June 12, 1946, and was participated in by eight representatives of the State Medical Society including your Committee and Director, two members of the New York State Osteopathic Society

^{*} The report has been condensed due to lack of space in the JOHNAL. The full report will be available to the Refer ence Committee

nine members of the Compensation Insurance Rat ing Board, and the president of the Associated In dustries of New York State

i3

The following resolution was unanimously adopted "The Conference agrees that the principle

is implicit in the Minimum Medical Fee Schedule that a duly qualified and authorized specialist is en titled to be paid an appropriate fee as such

(2) Cooperation from insurance carriers in obtaining information concerning physicians who are suspected of violation of Section 13-d or of profes-

sional misconduct or incompetence

(3) Rehabilitation. Dr George G Deaver, dr rector of the Institute for the Crippled and Disabled, who has been interested in the field of voca tional rehabilitation and is in charge of this service at N Y U and Bellevue Hospital discussed the possubilities and value of this type of work. An im portant part of the discussion related to the training and teaching of physicians throughout the State and elsewhere to be qualified to set up similar programs

Consideration was given to the setting up of local joint councils in other cities, vis Binghamton Rochester Buffalo Syracuse Albany and New York

Cit

Other items on the program were the following Legislation at the 1946 session failure of the Department of Labor to act on cases recommended for discipline, reporting by physicians fees not in the fee schedule—chest surgery anesthesia, allergy, etc., assistant fees (agreement reached on payment

of assistant s fees in hernia operations)

Workmen's Compensation Board Annual Report for 1946 —The Workmen's Compensation Board charged with the responsibility of administering the Workmen's Compensation Law in this State has made a report of its activities for the year 1946 which ments careful study The report is replete with statistics records and suggestions for im provement in workmen's compensation administration.

We wish to draw particular attention to the following quotation, with which we wholeheartedly

BETTER

pemation concern more people and are more costly than are other peacetime hazards; the problems of workmon a compensation are medicolegal as well as economic and social, and therefore of exceptional difficulty and intricacy; yet too often workmens compensation has seemed to be or in fact has been the almost forgotten step-child of ad ministration.

During the year nearly 400 000 hearings were held before referees and nearly 100 000 claimants were examined by staff medical examiners aminations were made or opinions rendered in 101 cases by expert consultants on dust diseases There has been a decided increase in the use of impartial experts who were called upon in 1,234 cases. is a marked increase over previous years the past year the Board received 2 232 applications from physicians for initial authorization and for rerating 786 of these were received by the county medical societies and 1,446 by the Medical Practice Two hundred and sixty-nine em Committee ployers medical bureaus, sixteen physicians bu reaus, one x ray laboratory and ten pathologic laboratories were licensed

An agency for planning and reviewing and revising the many functions incident to the administration of workmen's compensation and adjudication of claims has been set up charged with the responsi bility of reorganizing outmoded procedures re-vising outdated report forms and reviewing procedures in the light of new legislation and new inter pretations by the Board and by the Courts

One of the recommendations made by the medical societies to improve facilities for medical examina tions has been carried out. Women hearing room attendants were installed at itinerant referee hear

ing locations.

Certain test cases involving physicians arising out of the Moreland investigation in 1943 are still before the courts and over 150 other cases await

disposition

The plea of the Board for additional space for the Department in New York and Rochester should be given consideration The special needs of work men s compensation administration indicate the desirability of a building designed for those special needs and apart from other State operations. We are in particular sympathy with the efforts of the Board to set up the right kind of hearing and ex amination rooms

It is reported that the medical expense of administering the Workmen's Compensation Law charged to the insurance carriers in this State in 1946 was \$2,840 025 91 and the amount charged to

self-insurers was \$31 494 40

The direct cost of workmen s compensation in 1946 to New York industry and business was close to \$200 000 000 and the economic loss to workers and their families, plus the indirect costs to industry and

business, was soveral times this figure
We agree with the conclusion "It follows there-

fore, that the State medical examining service is challenged to bring sound medical judgment, well informed as to the latest advances in medical sci ence and practice to bear on the problems of work men a compensation disabilities in order to reduce the cost of workmen a compensation. role the medical profession plays in this important phase of work cannot be too strongly stressed

Your Director participated in several meetings of the Committee on Public Health and Education (Dr O W H Mitchell, Chairman) at which the question of the rehabilitation program of the State was discussed and a fee schedule devised, and meetings of the Veterans Medical Service Plan of New York, Inc relative to a fee schedule The Veter

It has sometimes not been sufficiently understood, even in high places, that good administration, equally with wise and forward booking legislation, is essential to the maximum unstudiness of a law as complex as workmost learning to the state of the second of the seco

ans Administration in the State has accepted the specialty ratings of physicians granted under the Workmen's Compensation Law A number of meetings were also held of the Council Committee (Dr Carlton E Wertz, Chairman), and the New York State Hospital Association, with the Joint Council on Radiology, Anesthesiology, Pathology and Physical Therapy (Dr Max Fein, Chairman)

Your Director also prepared legislation on work-men's compensation matters for submission to the Legislative Committee of the State Society, and attended meetings in New York and Albany In addition, he appeared before county medical society committees and special organizations, and assisted in the formal trial of a physician in Liberty.

Sullivan County

In our report to the House of Delegates in 1946 we commented on results of meetings held with representatives of the State Hospital Association, the Joint Council on Radiology, Pathology, Anesthesiology and Physical Therapy, and published resolutions which had been adopted to promote closer relationships between physicians and hospitals. These resolutions recommended, and the Council approved, the appointment of a joint council to consist of five doctors representing the above specialties, and five hospital administrators or as many as necessary to cover the State.

Although the Committee then representing the Hospital Association of New York State (1946) with Mr John McCormack as chairman, had agreed that radiology, anesthesiology, pathology, and physical therapy were the practice of medicine, and published the agreement in the March, 1946 issue of The Hospital Forum, official organ of the Hospital Association of New York State, this resolution never was placed before their parent body. A meeting of the Joint Committee was held on January 31, 1947 Representatives present from the State Society, the Hospital Association of New York State, and the Joint Council Committee were present. The hospital representatives again stated that radiology, anesthesiology, pathology, and physical therapy constituted the practice of medicine, and their counsel proposed an amendment to Section 1250 of the Education Law to include the four specialities as such

The amendment to Section 1250 of the Education Law was satisfactory to the Committee but the Council of the State Society disapproved any amendment to this section Further consideration will be given the matter before the 1948 meeting of the legislature

Amendments will be required to include the above specialties in Section 13-f(1) and Section 13-d of the Workmen's Compensation Law and in Sections 1250 or 1263 and 1264 of the Education Law It is essential initially to define as the practice of medicine, and to include as "medical" and "surgical" services, the four specialties, particularly the specialty of radiology before proper relationships with respect to these specialties can be effected

Hospital Bills—Hospitals throughout the State are persisting in submitting bills for services rendered by employed specialists (roentgenologists, anesthesiologists, pathologists, and physical therapists) and are not paying to the doctors the fees so collected. The hospitals are acting in accordance with Rule 22, which we believe to be contrary to the provisions of the Compensation Law. A brief has been drawn up asking for a revision of the Rule so as to make it conform to the Law.

Rule 22 of the Rules of Procedure under Section

13 of the Workmen's Compensation Law (7° 258 of the Laws of 1935 as amended, Pp 298 to Appendix) should be amended Said rule provide

Hospitals shall render bills for board and room a commodations medical and surgical supplies and animal facilities. Hospitals may render bills for x rays physicians the same pathologic services who rendered by or under the supervision of salaned physicians and persons rendering services for which chars are made by the hospitals must be included in all bills we all medical and x ray reports shall be promptly filed with the employer or its insurance carrier and the Departmente Lahor.

The first sentence is unobjectionable. The lattwo sentences permit the hospital to render bills to special medical services performed by salare physicians (roentgenologists, anesthesiologist pathologists, physical therapists) on the hospit staff. The hospital may not retain any of the feit so received except that a salaried roentgenologi in the hospital or a physician serving in a hospit as x-ray specialist pay to the hospital 331/1, per confidence of the fees collected. Section 13-f., subdivision of the Workmen's Compensation Law provides

(1) Fees for medical services shall be payable only lephysician or other lawfully qualified person permitted section thirteen b of this chapter to render medical cunder this chapter Hospitals shall not be entitled receive the remuneration paid to physicians on their states for medical and surgical services

Section 13-d of the Workmen's Compensational Law makes it a misdemeanor for any person with violates or attempts to violate or aids another violate Subdivision g of Section 13-d, and provide the removal of a physician from the list of the authorized to render medical care, if said physicians directly or indirectly requested, received or participated in a division, transference, assignment rebating, splitting, or refunding of a fee in count tion with the furnishing of surgical or medical caldinguous or treatment or services including x-ray & amination and treatment, etc. (except as here above excepted)

No doubt, the rule was one of convenience enable the hospital to submit bills for qualified a authorized physicians on its staff, to collect the in one lump sum and their to distribute the amout due to the respective physicians. In its press form, the rule has a tendency to grant permission hospitals to retain the fees for which they render bills. Certain hospitals have failed to pay to taphysicians the fees the hospitals have collected Both the hospital and the physician are violating the Workmen's Compensation Law under these circum stances.

We recommend that Rule 22 be amended so as to contain a provision directing the hospital to pay to physicians the fees for medical services

Application of "Free Choice" Principle It is the duty of every physician to comply with the conditions imposed by the Workmen's Compensation Law to treat only such patients as he is qualified by education, training, and experience to handle, and to refer to a better qualified physician for treatment all patients requiring more expert or special care than he can render. This is a moral and ethical duty and its strict observance will go a long way to justify and perpetuate the "free choice" principle in the Compensation Law

We hear a great deal about the cost of medical care in compensation cases. The employer or insurance carrier pays the bill for medical care and compensation. The type and quality of medical care.

that as a direct bearing on the cost of medical care and iso on the amount paid for time lost Further the M Scality of medical care may be and often is a deter thing factor in the payment to the worker for the medical care will determine the fate of the in no pared worker in relation to future working capacity a relation to the state both the physician and the state both the physicians of the state both the physicians of the state both the physicians qualified as in relation to treatment by physicians qualified

The We must here allude to the need for proper and peedy adjudication of claims before referees and public Workmen's Compensation Board. The undue apostponement of decisions and other delays inher rior ent in the settlement of claims are potent factors in prior prolonging the period during which physicians are obliged to treat or observe patients. As it is the duty of the Workmen's Compensation Board to im IK. prove the administration of the law to the end that larry claims may be settled without delay so too it is claim, the duty of the physicians to cooperate with the set parting and by appearance before referees when necessary

We are vitally interested in the cost of medical care, especially in view of the free choice principle The physician deals directly with the patient but a the doctor s bill. Medical costs are an important action in deciding premiums to be paid for ending the doctors. If these costs are excess the premiums rise. Employers add the cost. tions rise. Employers add the cost of compensation coverage to the costs of re-production and eventually the public pays the second in the price of goods and services. We see that the public pays the second cost in the price of goods and services. We see that the cost of the worker is promptly that the services of the services of the worker is promptly that the services of the servic total ma wate for medical care, if the worker is promptly

There is a direct relationship between medical care and the costs of compensation payments.

Prolonged treatment or improper medical care may keep the employee out of work beyond the time necessary to restore him to health and work. Neither the importunities of the patient (who does not pay the bill) nor the expectation of greater fees abould interfere with sending the patient back to his job as soon as medically indicated

restored to health and to work.

Medical care can be paid for adequately if the factors that produce excessive or improper medical costs are controlled. The cooperation of every physician and specialist treating compensation claims and is necessary. There is no reason why a compensation claimant should be treated differently from a private nation. from a private patient. Under the provisions of the Compensation Law a physician is unumited in his call upon the resources of the medical profession in order to get the patient back to work promptly

The medical societies are charged with the responsibility of the administration of the Workmen s Compensation Law in so far as medical care is con cerned and are bound to exercise alertness and vigilane to the end that the principles enumerated above are effectively carried out. The medical societies through their compensation committees and with the cooperation of the employers and insurance carriers have a unique opportunity to be of service. We urge them to give great consideration to these problems.

Collection of Medical Bills.—The number of medical bills aubmitted for collection from physicians throughout the State has greatly increased We have been successful through the cooperation manifested by insurance carriers. This is reflected by the very small number of bills submitted to arbi tration outside of New York City The participation of several of the larger county medical societies in the work of adjusting disputed medical bills also is an encouraging factor worth mentioning

Arbitration.—During the past year six arbitration sessions were held in Buffalo Albany, Syracuse, Newburgh, Binghamton and Nassau In all, 45 cases were arbitrated, 45 settled without a hearing and ten adjourned Medical bills amounted to \$5 970 34 of which \$5 613 34 were in dispute and total awards of \$3 481 84 were made representing 62 per cent of the amount in dispute

Radiology Examinations. Six examinations for Radiology Examinations and in Albany Thirty-seven physicians thirteen passed, 22 failed applied for examination and two failed to appear Candidates for radiologic
(D) ratings are required to obtained a passing mark of 70 per cent in general diagnostic roentgenology or in radiation therapy We urge all qualifying com-mittees to apply the standards meticulously and to refer for examination, all physicians who are not diplomater. We of the National court or readiology or who are not fully meet the requirements of the spe-Malty as set forth in the standards.

Fee Schedule.—The inadequacy of fees paid has been recognized for many years. The present fee schedule has been in operation for over ten years. The cost of living has increased by more than 50 per cent during that time, and the expenses of con ducting medical practice have risen in proportion. The House of Delegates of our Society has unani

mously resolved that an increase in the workmen s compensation fee schedule is warranted and neces-

sary
This Bureau began a study of medical fees in this
State in 1941 (Bulletin number 29) a study of fees
that the Heion was made also and compaid throughout the Union was made also and comparative tables prepared. In 1942 this Bureau informed the then Industrial Commissioner of the increased cost of living and of conducting medical practice and requested a revision of the fee schedule. In May, 1943 we advised the Industrial Commis-sioner that as a result of a survey made by the Bureau throughout the State, an increase in fees was justified We also informed him that the 5 per cent discount for payment of bills within thirty days should be revoked. Consideration of the mat-ter was postponed by the Industrial Commissioner pending the hearings of the Moreland Act Commis-

aioners then in progress.
In May and June of 1946 the Bureau advised the Chairman of the Workmen's Compensation Board of the action taken by the House of Delegates in 1945 and 1946 calling for an increase in fees and asking for and 10-10 calmig for an increase in tees and asking for temporary revisions in certain items pending a full hearing. On June 27, 19-16 a meeting with the Chair-man was requested. This meeting was arranged for September On July 18 10-16 the Chairman advised our President that she was conneiring a revision of the fee schodule and requested him to submit a report on the amount of remuneration he deemed

adequate. A meeting was held on September 12, 1946 with the Chairman of the Board and the proposed fees were submitted. Your Director was requested

by the Chairman to provide her with proof as to the necessity for the fees proposed in relation to medical fees for similar services in private practice, to persons of a like standard of living. Your Director addressed a letter to every county medical society in the State calling upon the secretaries and chairmen of Workmen's Compensation Committees to provide the necessary data to support the fees pro-Copies of the proposed fee schedule were made available to all county medical societies and physicians throughout the State Nearly 1,000 replies were received and submitted to the Chairman of the Board in October

The material submitted to the Chairman of the Workmen's Compensation Board amply sustained the proposed fees A similar fee schedule was prepared and accepted by the Veterans Administra-

tion

If the best-qualified physicians in the State, and over 22,000 physicians have been authorized to treat compensation claimants, are to be available for treatment the fees paid must be adequate Low fees, out of line with fees paid by private patients of a like standard of living, combined with the necessary burden of making out and filing reports, will have a tendency to discourage physicians from ac-

cepting compensation claimants

ne entire medical profession has for a number of vears been dissatisfied with the fees paid and there radiology, anesthesiology, pathology, and fees al therapy were the pro-tic. of medicine, and ersal demand for an upward revision, and fees hed the profession Law minimum for issue of vious compensation. Law minimum for issue of vious compensation of the average private patal for pay for medical services, the statistics repay for medical services, the statistics retained to the ladiustrial Commissioner of this State hams the Industrial Commissioner of this State at based upon earnings in 1939 workers in ned an average of 187 per cent more, while arnings increased nearly 175 per cent lls in 1943 to 1945 averaged nearly 300 lls in 1943 to 1945 and 1946 over 200 per cent t and in 1945 and 1946 over 200 per cent than those in the period 1935 to 1939 for May, 1946, was nearly \$50 per week, 75 less than the peak years of the war igures are cited to indicate that the average is well able to pay a higher fee in private e than in 1935 to 1939 Therefore, fees and ons in private practice were substantially in 1946 than in 1935, some county medical es published fee schedules for private practice provisions of the Workmen's Compensative, fees paid for medical and surgical servants be "fair and adequate" and "shall be described to such charges as provisions of the workmen's Compensative, fees paid for medical and surgical servants be "fair and adequate" and "shall be described charges as provided in the same content. d to such charges as prevail in the same comy for similar treatment of injured persons of a tandard of living," the above factors are per-

e Chairman of the Workmen's Compensation d, appointed a committee representative of stry, labor, insurance carriers, and the medical ession, including the Secretary of the Medical sty of the State of New York, which has the osed fee schedule before it for consideration and make a report and recommendations to the irman Dr Nathan B Van Etten is Chairman he Committee Your Chairman and Director eared before one meeting of the Committee in the report of the port of the proposed fee schedule and additional itings will be held

mendments to the Workmen's Compensation w—We again this year, as the result of the man-ie of the House of delegates, introduced bills in Assembly and Senate to restore the functions noved in 1944 from the four New York

having a population of over one million have been no constructive acts on the part of the Medical Practice Committee to justify its existence as a substitute for county society participation as a substitute for county society participation. The Medical Practice Committee (three physicians appointed by the Chairman of the Workmen's Compensation Board) has called upon the county medical societies in the four New York counties to carry out for them the procedure of reviewing the applications of physicians for ratings and relatings in the first instance and latterly has called upon our State Society Compensation Bureau Examining Committee in Radiology to examine applicants for radiologic ratings The need for the Medical Practice Committee is not apparent and it should be abolished and the functions restored to the county medical societies

Your Chairman is a member of the Advisory Committee appointed by the Chairman of the Work men's Compensation Board and was called to advise as to legislation recommended by the Char man of the Board Twenty-nine recommendations of the Workmen's Compensation Board were con-Some of these were sidered at two meetings deemed necessary and essential to the proper administration of the Compensation Law For m-stance, Section 13-c 2, added in 1944, prohibited the payment for x-ray examination or treatment ex This would cept to a qualified roentgenologist have prevented any physician or specialist, other than an x-ray specialist, from being compensated for taking an x-ray or from treating by the use of x

violacevs An ordinary practitioner would have been for the rentrung in the diagnosis and treatment of frachams rectly or and At our request the Chairman of the hams tractly or induct our request, the Chairman of the tures, etc. " a division, traffion Board issued a riling Workmen's Compensation of the tures, etc." a division, traffion Board issued a riling Workmen's Compensation, traffion Board issued a riling workmen's Compensation of the induction and as rays in accordance with their ducal or meta-hedule. Unprovided and limited in the fee standard or restrict this practice, but probably their into so restrict this practice, but probably their intent was to prevent the taking of x-rays in separate x-ray laboratories except by a specialist pointed out that this could be accomplished by a simple addition to this section as follows in Section 13-c2

No claim for services by an x ray laboratory in connection with x-ray examination diagnosis or treatment of any claimant under this section shall be valid and enforceable except by a physician duly authorized as a roentgenologist by the Chairman for services performed by such physician or under his immediate supervision

We objected to an amendment again introduced this year as in 1946, giving the Chairman of the Workmen's Compensation Board sole discretion to designate physicians of outstanding qualifications to serve as impartial specialists in determining diagnosis, prognosis, causal relationship, functional disability, type of treatment necessary, etc. At the present time such specialists are designated on recommendation of the county medical societies Panels of experts were provided for in the law of 1944 but have never been appointed by the Chairman of the Workmen's Compensation Board We urged the appointment of these panels and they were also recommended by the original Commission appointed by Governor Lehman in 1933, as being appointed by Governor Lenman in 1935, as penny necessary for the proper administration of the Compensation Law We believe it unwise and unsafe to give to any political appointee sole discretion in making such remunerative appointments as a property of the ball without adequate professional provided in this bill without adequate professional standards and without recommendations from or approval by the county medical society

We approved an amendment to take off the limitations to medical care in silecosis (Section 15

8-d) The Workmen's Compensation Board recommended an amendment to authorize claim filing by any worker up to two years without Board action (Section 28-a) and to except "slow starting" occupational diseases from the two year statute as to provide for claim filing within ninety days after knowl edge of an occupational disease (Section 28-b) Many patients fail to notify their physicians that their injury or illness was caused during or as a result of their work and physicians are often confronted with the necessity of reimbursing claim ants who contracted for treatment as private pa tients paid for the services and made a claim sub-sequent to completion of treatment. Under the present one-year clause this has happened often enough to warrant recommending the inclusion in the law of a provision to protect physicians who have rendered treatment to such patients who only subsequently make a claim for compensation and who fail wilfully to notify a physician of the nature and ongin of the injury

An amendment is required giving the Workmen s Board authority to determine Compensation whether medical care was given in good faith before a claim was made or if the claimant failed purposely to disclose a compensable injury and to exempt the physician from reimbursing the claimant for serv

ices rendered prior to making a claim

An amendment was introduced to authorize the Chairman of the Workmen's Compensation Board to review, revoke, or revise the rating recommended by the county medical society workmen s compensa-tion committees or by the Medical Practice Committee in New York, confirmed by the Chairman of the Workmen's Compensation Board, if the Com mittee of the county medical society or the Medical Practice Committee makes a recommendation to the Chairman to thus effect. It gives the physician so affected the right of appeal to the Medical Appeals Unit of the Industrial Council This amendment was considered necessary because of an opinion rendered on October 15, 1945 by Attorney General Goldstein to the Chairman of the Workmen's Com pensation Board as follows

The Chairman of the Workmen's Compensation Board does not have any authority to re-examine reduce, or revoke special ratings granted to physicians authorised to reader medical care under the Workmen's Compensation Law apart from the physician special authority to practice under that Statute. Such special ratings are regarded as tights equal to the primary suthorisations are regarded medical care and may not be primary suthorisations are regarded medical care and may not be found to the care to

This amendment raises questions of constitu tionality and property rights Revisions and sim-phification of the ratings originally given through out the State if considered necessary were effected without complaint by physicians in more than a few instances, after county compensation commit tees were instructed to simplify the ratings Charges under Section 13-d can be preferred for improper or unprofessional medical conduct or fee splitting, etc. or for medical incompetence. The proposed amendment would enable the Chairman of the Competence. pensation Board on the recommendation of the county medical society or the Medical Practice Committee to effect a change of rating or revoke same. The affected physician would have the right of appeal subsequently but no right to a hearing before his rating was changed. This is improper and we, therefore oppose the amendment unless the right to a full hearing after due notice of the reason for the intended change is served upon the physician. Certainly a physician once rated in accordance with certain standards and by regular procedure as provided by law should be secure in his rights to practice his specialty until he is formally charged with develections so that he may be aware of them and given an opportunity to defend his nghts.

An amendment to provide for some equitable fee basis between physicians and hospitals for x ray examination by salaried reentgenologists was sug gested There should be a provision in this bill to provide a mechanism whereby it may be ascertained whether the contract is reasonable and equitable Furthermore, there should be a provision to enable the Chairman of the Workmen's Compensation Board, or either interested party to resort to arbitration of disputes as to the reasonableness and equity of the contract either during or after its completion. It is not certain that 331/4 per cent or 40 per cent of any fee received by a physician under contract is a fair and reasonable return to any hospital Since there are other salaried physicians beades roentgenologists who contract with hospitals these too should be included in this section. are anosthetists, physical therapy physicians, and pathologists. The mere reviewing of a contract between the physician and a hospital may not en-able the Chaliman of the Workmon's Compensation Board herself to determine whether said contract is reasonable and equitable and within the spirit of the provisions of Section 18-d. Consideration of the terms of the contract by an arbitration committee of at least three persons would be preferable. One member should be appointed or selected by each party in interest, and one by the Chairman of the orkmen # Compensation Board

An amendment was suggested to authorize the Chairman of the Workmen's Compensation Board to accept the assignment of claimant a cause of action against authorized dootor and procedute same. Thus, any compensation claimant who pays a fee to a physician for medical services shall have a cause to a physician for medical services sain have a cause of action against such physician for the recovery of the money paid and this action may be assigned to the Chairman of the Workmen's Compensation Board in trust for the assigning claimant. The Chairman may sue such physician on such assigned cause of action with the benefits and subject to the provisions of existing law applying to such actions

by the claimant himself
The present law provides that a physician author ized to treat compensation claimants shall not accept or receive a fee from a compensation claimant, but shall have recourse to the employer or carrier With this we agree. Cases arise however in which a physician is not aware that a patient is a claimant under the Workmen's Compensation Law patient may deny a compensable accident. The physician often by careful history and interrogation may not be able to ascertain that the patient has suffered an industrial accident or an industrial ill ness or disease. After the physician s services are contracted for and paid, a claim is made, often long after the accident, occasionally it occurs that the patient did not report an accident to the employer in the stipulated period of time, or did not file a claim with the Workmen's Compensation Board, within the statutory period. Subsequently the physician is required to file reports and the claim

may be allowed by the referee or Board Where the claim is allowed, the physician has been required to refund the fee paid, and look to the carrier or employer for payment. The claimant may have agreed to pay, or paid a fee in excess of the minimum, but the physician is usually paid in accordance with the minimum fee schedule, regardless of the ability of the patient to pay, as indicated by the amount he voluntarily paid the physician. Furthermore, when the physician is not aware of the fact that he is dealing with a compensation claimant, he makes no reports and subsequently the carrier or employer objects to his bill, because he did not file reports

within the statutory period

It is not fair to the profession to enact such a drastic amendment to the law without safeguards to the practicing physician The present amend-ment refers to any compensation "claimant" and if it were held that a patient was a claimant only when he made a claim, there could be no objection to the amendment It is not contemplated that a physician who fails to interrogate a patient as to the manner in which his injury or illness was sustained, so as to determine whether the patient is entitled to medical care under the provisions of the Compensation Law, shall be supported in accepting a fee paid by the claimant, when a physician has made every effort to ascertain whether the injury or illness is compensable and cannot reasonably so determine the fact, and when an individual has not made a claim, or advised the physician of the exact circumstances of the injury or illness, the physician should be protected and not be subject to suit A preliminary hearing should be held to determine whether the fee was obtained in good faith, whether an industrial accident was described, or a claim made, or whether the circumstances were such that the physician should have been able to advise the claimant that he was entitled to medical care under

the provisions of the Law
Physicians acting in good faith have had their interests seriously jeopardized under the present law, and the contemplated amendment does not provide

any measure of protection

An amendment to provide for the arbitration of hospital bills similar to, but not identical with, the arbitration of medical bills was approved

An amendment to provide for the authorization of employers' medical bureaus maintained by a group or association of employers at a place or places of employment was disapproved On the basis of an investigation of such a bureau in Jamestown, New York, we strongly objected to any such amendment to the law as endangering the right of the employees to free choice

An amendment to authorize group practice under the Workmen's Compensation Law was introduced in 1946 and was vetoed by the Governor strongly objected to the provisions of this bill as endangering the entire structure of the Workmen's

Compensation Law as amended in 1935

The bill to amend both the Workmen's Compensation Law and the Education Law to permit group practice was a badly drawn bill and strongly objected to and condemned by us and all other inter-ested parties We favor ethical group practice

In the setting up of various groups under various voluntary insurance plans, the question as to the proper treatment of claimants under the Workmen's Compensation Law is raised Improper supervision of patients permitting a group to collect fees in compensation cases may result in poor medical care through failure to provide for continued supervision by a responsible physician able to give testimony

The distribution of responsibility among a group might result in circumstances similar to those that prevailed before 1935 Unless this bill is properly drawn and avoids the pitfalls in last year's bill which would have permitted partnerships of a statewide nature (chain-store medicine), conditions pre-vailing before 1935 would be restored to the detriment of the injured worker

An amendment to Section 56—owner's hability for compensation to employees of contractors-

reads as follows

Any person firm or corporation engaged in any operation for profit who contracts to another all or any part of such operation involving or including a hazardous employment, shall be deemed a contractor for purposes of this section and such other a subcontractor

Attention is called to the use of the words "any This might involve person" in this amendment any physician who engages a contractor to do work for him, if the latter is not insured The physician would, under this Section, become a contractor and hable for compensation in case of injury or death, eg, a physician engaged in making calls might be construed to be engaged in an operation for profit, if in the course of his rounds his auto becomes disabled, or he gets a flat tire The employee he engages to repair the machine or change the tire might be employed by a person not covered under the law

The physician might then become liable

An amendment recommended by us to regulate the place of arbitration of disputed medical bills and to provide that such arbitration take place in the city or county where the medical service was rendered rather than in the county where the employee resides was again introduced

Forms —The Workmen's Compensa-Report tion Board has printed less than one-half the number of forms necessary There were over 715,000 new accidents reported in 1946 At least eight forms are required in each case Frequently, duplicates are required and in protracted cases additional C-14 forms must be filed Forms are sent in bulk by the Workmen's Compensation Board to the various county medical society offices and distributed to doctors by the secretaries or chairmen of the workmen's compensation committees We have received innumerable complaints from county societies and physicians of their failure to obtain an ade-The Chairman of the Workmen's quate supply Compensation Board felt that forms were being wasted but when her attention was drawn to the actual needs and the failure of her supply to meet such needs, she requested your Director to confer with the Manager of the Compensation Insurance Rating Board to suggest a solution She stated that the paper shortage made it impossible to get a After such conference we more ample supply notified the Chairman that it was the responsibility of the Board to supply forms. The shortage of forms may greatly retard reporting and slow up the process of payment of compensation and claim settlements

Travel -With the increase in county society activities comes the need for closer cooperation between the societies and the State Medical Society Bureau While the help and advice of the Bureau have been sought with increasing frequency during the past years, the difficulties of travel during the war years and up to recently have prevented more frequent visits on the part of the Director to county medical societies. It is hoped that in the coming year this defining may be provided. year this deficiency may be remedied

Medical Directory and Veterans Administration—The staff of the Bureau has been busily engaged in suding the preparation of the new Directory and in compiling lists of specialists for the Veterans Administration—This has been a difficult and timeconsuming job, doubly so because of the shortage of space in the office—and the need for great haste

Full-Time State Employees.—The Chairman of the Workmen & Compensation Board has refused to grant certificates of authorization to a number of physicians employed in State hospitals — It is her belief that such physicians might not be able to appear at hearings because of their work in State hospitals

This matter is being further investigated

Round table Discussions.—Round-table meetings or discussions on workmen s compensation were held in Buffalo and in Binghamton and both meetings were very well attended Your Director parties pated in these together with representatives of the Workmen's Compensation Board employers labor and insurance carriers we have had enthusassite reports on the value of such question and answer meetings and similar ones are being arranged by other county seeleties. We urgo all county medical societies to arrange such meetings once each year and means of disseminating up-to-date information on compensation matters and stimulating cooperation between the profession and the other groups interested in Workmen's Compensation. This is a fine meedium for improving 'public relations'

Professional Qualifications.—The medical societies in all counties having a population of less than one million are charged with determining the profes-We believe the sional qualifications of physicians determination of professional qualifications should be the function of the medical societies and remain within the framework of the organized medical profession. Over a period of ten years there have evolved methods to determine these qualifications based upon standards of education, training, and experience originally set up by this Bureau and modified from time to time. The granting of specialists and other ratings must be carried out moticu Standards should be sufficiently high so that a physician who is rated as a specialist under the Workmen's Compensation Law will be regarded with the same confidence and respect as the bolders of National Board specialty diplomas and members of the American Colleges. Our standards are such that if the county medical society workmen a compensation committees adhere closely to them with such minor concessions as are deemed necessary to meet conditions of practice in the smaller communities, the recipionts of specialists symbols will be of such professional stature as to justify the confidence placed in the organized profession by the executive and law making bodies of the State

Under date of January 7 1947 we issued a bulletin emphasizing the importance of county society
compensation committees measuring up to their
responsibilities in the rating of physicians and of
fering add in the procedure Suggestions were made
as to the composition of the Workmen's Compensation Committee the methods of applying the stand
ards, recommendations for regular meetings of the
full committees to consider applicants and the procedure to be followed in granting ratings in diagnostic reentgenology and radiation therapy. We have
been fortunate in obtaining the services of outstanding radiologists in the metropolitan area and
in the larger cities of the State to serve as examin
ing committees for applicants for x-ray ratings.

We have given the statistics of the examinations conducted as evidence of the need for great care in the scrutiny of the qualifications of these applicants Incidentally the Medical Practice Committee which is charged with the responsibility of qualify ing physicians in the four New York countles having a population of over one million, utilizes the serv ices of the Examining Committee in radiology for applicants in New York. It also depends upon the county medical society workmen a compensation committees in the four New York counties to review other applicants in the counties, and act upon their recommendations. The advantage of the county medical society compensation committees, pecially in the larger counties, over the Medical Practice Committee of three is the setting up in these counties of special qualifying committees in each specialty as advisory to the county compensation committees. In the smaller counties, one or more outstanding specialists serve as advisors to the committee in the determination of specialistic qualifications. The superiority of this procedure over that of the Medical Practice Committee of three physicians appointed by the Chairman of the Com-pensation Board (all of whom are at present sur geons) must be apparent. In many instances in which a physician applying for a rating involving surgical procedures is unknown to our committee and the applicant has no staff hospital appointments the applicant may be required to prove his surgical technical ability by performing one or more major operations, before making recommendations to the Chairman of the Compensation Board Over a period of nearly eleven years there has been a gradual improvement in procedure so that the decisions of county medical society workmon a compensation Committees may be looked upon as authoritative we commend the cooperative spirit manifested by the compensation committees of the county societies in carrying out these functions and urge them to do everything possible to improve their methods.

In the past certain county medical society compenastion committees have largely confined their activities to qualifying physicians and medical bureaus and some have not taken too seriously the supervision of medical practice Perhaps the fail ure of employers and insurance carriers to bring to their attention promptly evidence of incompetence or improper medical practice is to blame At best it is difficult and certainly distasteful to criticize the work of a colleague Lest we be misunderstood it is not our purpose to interfere with the right of the physician to treat his patient in accordance with his time honored rights or to come between him and his patient. Under the provisions of the Workmen a Compensation Law however a physician agrees to limit his practice to what he is qualified to do as a result of his education, training and experience, and the symbols granted on the recommendation of the the symbols granted on the recommendation to treat pa-county medical society as authorization to treat pa-the renew of his practice. This county meanca society as authorization to treat partients indicates the range of his practice. This implies a duty and responsibility on the part of the medical society tactfully, but definitely, to assume a role in the guarantee of adequate medical care to the workmen's compensation claimant.

Perhaps much can be accomplished if there were a frank discussion of the factors above enumerated at meetings of the Society to which all physicians authorized to treat compensation claimants were invited

M-17 Thoracic Surgery —In 1942 your Committee after approval by the Council, recommended to the Department of Lebor that the symbol M 17, which previously had been a catch-all for unrelated specialties, be abolished, and that M-17 be utilized for the specialty of thoracic surgery Under date of March 30, 1942, Mr Ralph R. Boyer, director of the Division of Workmen's Compensation of the Department of Labor, approved the use of this symbol for thoracic surgery A number of surgeons throughout the State applied for and received this symbol on the recommendation of their county medical societies

The present Chairman of the Workmen's Compensation Board, Miss Mary Donlon, has recently raised the question as to the validity of this symbol, despite the evidence in our hands that the Department not only approved the change in the symbol but also confirmed said change by granting M-17 ratings to a number of applicants mined effort is being made to induce the Chairman of the Workmen's Compensation Board to confirm the use of this symbol for thoracic surgery Since the adoption of all symbols and the setting up of standards for qualifications under the Workmen's Compensation Law have been primarily and substantially the work of this Bureau, it seems strange that the Department should now fail to follow the recommendation of the Society We recommend that the symbol M-17 be granted to physicians who possess the necessary qualifications established for this specialty

PART XI

Publications

By resolution, the Publication Committee is made up of a member of the Board of Trustees, the Secretary, the Treasurer, the Executive Secretary, and the Managing and Literary Editors Dr Kirby Dwight, who represented the Board of Trustees, passed away on December 4, and was replaced by Dr John J Masterson The latter with Dr James R. Reuling, Dr W P Anderton, Mr Dwight Anderson, and Dr George W Kosmak, Chairman, and Dr Laurance D Redway constitute the Committee

at the present time

During the past year your Committee at monthly meetings gave careful consideration to the matters connected with the publication of the JOURNAL and the Directory In addition; special meetings of the editorial group were held to discuss the editorial content of the Journal. The Committee has constantly endeavored to enlarge and improve the makeup of the JOURNAL and regrets that this effort has been hampered by difficulties due to paper shortage and printing delays The present size of the JOURNAL does not permit the inclusion of a sufficient number of scientific articles in the various issues to assure a reasonably prompt appearance after being submitted by their authors. These delays, naturally, are productive of complaints by the latter, but the situation cannot be remedied until a more adequate supply of paper is available We trust that this may be obtained at an early date We have endeavored to expand the news features in the Journal and have added several special departments dealing with the Veterans Administra-tion, Medical Care Plans, Council Meeting minutes, etc, in order to keep our members informed of the Society's diversified activities The editorial section has been carefully supervised and the field expanded to include comments on a variety of topics, directly or indirectly related to medicine, with the hope that these would prove both informative and We are pleased to note that our editorials have elicited critical responses from readers and that an increasing number have been quoted in the newspapers and other periodicals

Changes in the composition of the editorial staff during the year have included the addition of Dr Armitage Whitman as an associate of Dr Laurance Redway

The technical staff concerned with copy reading, makeup, and other production details has been increased to three persons, somewhat more adequate, but as yet insufficient, office space has been provided, and arrangements made to file recent issues of exchange journals for regular scrutiny by the editors for items suitable for comment

The circulation of the Journal now averages over 21,000 copies of which 539 are paid subscriptions Your committee has made recommendations to the Board of Trustees for an increase in the subscription price as well as in the allocation for members in a re-

cent explanatory memorandum.

Financially, the JOURNAL has continued to present a more than satisfactory condition, since the time when the Society began to manage all its affairs, business and editorial, from the central office The deficit encountered in the years from 1940 to 1942 has been eliminated. The returns from advertising which have been most satisfactory may no longer continue on this scale in the near future, if business restrictions develop Moreover, production costs have and will probably continue to increase, particularly if the contemplated enlargement of the Journal can be developed To proment of the JOURNAL can be developed. To provide for such contingencies, the Publication Committee requested the Board of E. mittee requested the Board of Trustees to establish a Journal Reserve Fund to be drawn upon as the occasion demands

The new issue of the Medical Directory, in view of the lapse of time since the previous volume was published, the many new names to be included, changes of residence, hesitancy of printers to accept contracts, shortages in paper and materials for binding, the organization of a compilation staff, etc, have all delayed the expected date of publica-The project is a large one, the edition will be about 23,000 copies for distribution to members, to advertisers, and to many cash purchasers. This work now has great commercial value to insurance companies, pharmaceutical houses, publishers, and The greatly increased costs of manufacothers ture will undoubtedly result in a much larger deficit than occurred with the 1941-1942 edition Costs of manufacture have more than doubled and the number and salaries of the compiling staff have largely increased

Your Committee recommends that the House of Delegates continue this Special Committee working under supervision and reporting to the Council, and that the House give the following directive as to con-

tinuance of its personnel

"The Publication Committee shall consist of the Secretary, the Treasurer, the Executive Secretary the Managing and Literary Editors, and one member of the Board of Trustees, to be appointed by the President of the Society after consultation with the Chairman of the Board of Trustees"

Attention is called to the following detailed statement as a demonstration of the important role played by the publication activities of your Society

NEW YORK STATE JOURNAL OF MEDICINE

Total circulation	21,028
Member's copies	20,291
Cash subscribers	539
Copies to advertisers, exchanges, etc	631
Pages of scientific articles, etc	1,510
Pages of advertising	1,327

Acknowledgments are due for efficient and conscientious work by your Chairman to the various members of the Publication Committee, to Miss Willms L. Simmons and her assistants in the edi torial office to Mr Dwight Anderson Business Manager, and his associates in the business department, to Drs. Redway and Whitman for their production of editorials, and to Miss Dougherty and members of the general office staff for their assistance in many capacities This spirit of most helpful cooperation is gratefully recognized for this has been most helpful in developing a high standard of jour nalistic achievement as well as placing our publica tions on a self-sustaining basis

Medical Publicity

The Council Committee on Medical Publicity was continued with the same personnel

Floyd S. Winslow M. D., Chairman Francis N. Klimball M.D. Rochester Now York Frederick M Miller Sr M D Utica The Committee presents the following report

Publicity and public relations activities this year have been aimed chiefly at continuing educational efforts on the use of animals in medical research making known to the public the activities of the medical profession in drawing up a plan of pravate medical care for veterans combatting bills to license chiropractors in the 1947 session of the Legislature and the pursuit of usual informational activities on socialized medicine Close cooperation has been established with Dr. Robert R. Hannon, Executive Officer in legislative matters.

News Releases.—Throughout the year press releases on postgraduate programs and teaching days held under the auspices of the Committee on Postgraduate Education were sent to newspapers in the counties where those events were taking place. News releases based on President Hale's addresses and the scientific programs of each meeting were pre-pared and distributed to newspapers as each of the eight district branches of the Society hold their annual meetings. Steps taken by the Society and the Veterans Administration in the organization of the Veterans' Medical Care Plan, Inc. were an nounced through releases sent to all newspapers in the State. Complete coverage was given to the events and scientific papers which were part of the 1946 Annual Meeting Abstracts of scientific papers were made available to the press.

Chiropractic Legislation —When attempts to license chiropractic in the State of New York were made during the 1947 session the Society acted promptly in the interest of public health. The Noonan-Santangelo Bill, providing a licensing board with one chiropractor board member, was introduced in the Assembly February 11, and in the Senate on February 14 The Scelye-Coville Bill, providing for a licensing board of all chiropractors followed this first bill and was introduced in the Senate February 19 and in the Assembly on the same day These bills were strewdly proceeded by a specious article by C W Weint called 'Chiropractic Precents Its Case in the February edition of the Reader's Digest Copies of this article were distributed among the legislators

The Public Relations Bureau promptly made re-

prints of an article, Can Chropractic Cure? which appeared in Hygen, April, 1946 and was later condensed in the Reader's Digest June 1946. In addition handbills, briefly stating the Society s reasons for opposing the bills, and post cards for mailing to legislators were prepared This printed mailing to legislators were prepared. This printed matter was disseminated through county medical societies, the Woman's Auxiliaries and county Tuberculosis and Public Health Associations.

To assist county societies, two representatives of the Public Relations Bureau visited key cities throughout the State devoting one day of work to each one Mr Thomas E Walsh visited Albanic Schenoctady, Utica, Syracuse, and Rochceter Mr Edgar Lum Cook visited Binghamton, Elmira, Olean, and Jamestown.

The distribution of this material was not restricted to medical and health organizations, but included women a clubs and fraternal and service organiza tions as well as others in these key cities and the surrounding counties. The cooperation of the press

was requested and obtained

Publications and Printed Matter—The most important project of the Bureau, following the successful antivivisection campaign has been the proparation and publication of a 64-page booklet called Check and Double Check on Sickness Insurance.

With socialized medicine the national debate topic for high schools during the current school year it was thought that a booklet dealing with compulsory sickness insurance voluntary health insurance and socialized medicine in general would be a real contribution. Check and Double Check is in terre question and answer form. J Weston Walch, Post lead Water schoolstacker is the author. The Portland Maine, schoolteacher is the author The public relations bureau supplied much of the ma terial and consulted frequently with Mr Walch during the progress of the preparation of the manu script. Much painstaking work went into this pub-lication. Elisabeth W Wilson, of Boston an ex perionced actuary, provided invaluable assistance in checking data. Care was taken to include as many phases as possible of the subject. Consultations with authorities on the subject were held prior to printing. An all-inclusive index is an important feature of the booklet

Check and Double Check' has had a splendid reception. Orders have come from medial societies and other organizations all over the country March 1 800 orders had been filled for well over 11,150 copies. Orders of from several hundred to 2,000 have come from points such as California, Olilo, Illinois Florida, Virginia Texas, Boston and the Philippines The American Medical Associa tion ordered 1 000 These have all been paid orders The policy regarding payment has been to make them available free of charge in New York State and to charge 25 cents per copy outside of the State with the price scaling down according to the size of the order Many congratulatory letters have come from readers associated with both medical and nonmedical organizations

The News Letter was published several times dur ing the year and malled to a list of 600 physicians.

Articles in Magazines.—Several articles which appeared in nationally known magnaines were prepared with the assistance of the Bureau cluded 'Can Chiropractic Cure? by Albert Maisel which appeared in the June 1946 issue of Hygera and Reader's Digest, "Mice—or Men an article on the use of animals in medical research, by Maj Gen. Norman T Kirk in the April Coller's an editoral on the New York State campaign against antivivisection legislation, followed by a spread of pictures taken during the campaign appeared in the April and June issues of Hypera. In the June Harper's Magazine, Bernard DeVoto's The Easy Chair" was given over to the antivivisection issue Speakers' Service Department.—In accordance with the resolution of the House of Delegates regarding the establishing of a speakers' service, a preliminary survey has been conducted by the Public Relations Bureau in the following counties Albany, Bronx, Erie, Kings, Monroe, Nassau, New York, Queens, Richmond, and Westchester More than 50 physicians and eight interested lay persons have been consulted

All of the physicians interviewed, speaking either as officers of county societies or individuals, deem it advisable for the county societies to form speakers' bureaus. The objectives of these bureaus would be to provide a means through which the members themselves can keep abreast of current problems, and also a mechanism by which they can keep the people of the county adequately informed of the activities, objectives, and policies of the organized

medical profession

The majority of those interviewed also favor the formation of a State speakers' service which would be prepared to supply material and assistance to the county bureaus whenever requested. As a result of preliminary conferences conducted as part of the survey, the public relations committee of the Nassau County Medical Society has already undertaken to establish a subcommittee to conduct a speakers' bureau

A résumé of the information obtained indicates that the consensus of opinion of physicians is that a state speakers' service, to accomplish the following objectives, would be helpful to the county societies

1 Revitalize existing county society speakers'

bureaus,

2 Assist in the establishment of speakers' bureaus in societies which do not have them,

3 Provide the county societies with a plan for assisting physicians to speak on lay topics

The public relations bureau is planning the extension of this service along the foregoing lines Mr Thomas E Walsh, Field Secretary, who made the survey, will visit several county societies and assist in the work of organization.

Public Service and Miscellaneous —The public relations bureau has received daily requests for material on socialized medicine. Kits of available material were made up early in the year and were used to fill those requests. With the publication of "Check and Double Check on Sickness Insurance" this task became easier since this booklet alone contains answers to a multitude of questions.

Conferences were held with persons seeking information regarding the Society's stand on various questions and with writers planning magazine articles on medical subjects. Many other calls upon the bureau were handled in which advertising agencies, public relations agencies, newspapers, and press services sought information directly or assistance in locating sources of needed information.

A mimeographed outline of the Wagner-Murray-Dingell Bill was prepared by Miss Lyon for distribution to interested persons. The outline, together with copies of the American Medical Association's Ten Point Program, were sent to officers and legislative chairmen of the State Woman's Auxiliary and became the basis for study in some countries.

became the basis for study in some counties

Assistance was given Dr W W Bauer, Director
of the A M A Bureau of Health Education, in preparing one of the broadcasts in the A M A radio
series, "Doctors Then and Now" Material was
assembled on which was based the program featuring Dr Stephen Smith's life and times President
Hale was secured to give a three-minute talk at the

close of the program, which was heard on the coast-to-coast network of NBC on January 11

Mr Anderson and Miss Lyon were interviewed on the antivivisection campaign in an article for the July issue of *Medical Economics*

Miss Lyon addressed several organizations on socialized medicine and voluntary medical insurance during the year

Woman's Auxiliary —Cooperation was extended to the Woman's Auxiliary in the development of their program Miss Lyon consulted with officers frequently and assisted them whenever called upon whether in connection with program or organization of new units —The auxiliary did splendid work during the year in promoting voluntary medical care insurance and plans to continue this work —Under the leadership of Mrs James Bucci, public relations chairman, the county auxiliaries have been instrumental in providing the Public Relations Bureau with a valuable list of names of thousands of prominent persons throughout the State —This will replenish and bring up to date the Bureau's regular mailing list

Mailing and Distribution.—The distribution of our material may be seen in the following figures A special mailing, done immediately after the antivivisection campaign in April, consisted of reprints from the Collier's article, the Harper's article, a reprint of the interview in Medical Economics, and a mimeographed account of the antivivisection campaign. This went out to 1,500 persons who were vitally interested in the campaign. Reprints of Dr Cunniffe's presidential talk before the 1946 Annual Meeting—taken from Vital Speeches of June 1—went to 34,000 persons. Reprints of the talk delivered by Dr Hale before the June, 1946, Conference of Health Officers and Public Health Nurses at Saratoga Springs, which appeared in Vital Speeches of September 1, were sent to 400 key persons and editors of medical journals and was widely reprinted.

Meetings Attended —Mr Anderson and Miss Lyon attended all district branch meetings and the semiannual meeting of the American Medical Association Mr Anderson attended the annual meeting of the AMA held in San Francisco in July Miss Lyon attended the Annual Conference of Health Officers and Public Health Nurses held in Saratoga Springs in June

PART XII

Miscellaneous

Medical Licensure —The Council Committee on Medical Licensure consists of the following

F Leslie Sullivan, M.D., Chairman (deceased) Scotia

Morris Maslon, M D Ivan N Peterson, M D Glens Falls Owego

During the year 1945, there were 9,153 licenses to practice medicine and surgery issued by the examing boards of the 48 states, District of Columbia, and the possessions. This compares with 9,647 issued in 1944 for the same states and possessions. Of the former number, 5,541 were given after examination and 3,612 by reciprocity and endorsement of other state licenses or of the certificate of the National Board of Medical Examiners. In the year 1944, 7,058 were issued after examination and 2,589 by reciprocity and endorsement.

Contrary to the usual custom in the past, New

York does not lead in number issued, but gave way to California who issued 1 203 licenses. New York licensed 709 and Pennsylvania 518, both over 500 Illinois, 481, Ohio, 452 Massachusetts, 250. Twenty states, the District of Columbia and the

Twenty states, the District of Columbia and the territories licensed fewer than 100. The smallest number (aix) was granted in Wyoming and only one physician registered by examination in Nevada. Twenty-one boards (notably California, Connecticut, the District of Columbia, New Jersey and New York) Heaned more physicians by reciprocity or endorsement than by examination. Florida, Idaho, Massachusotts Rhode Island and Hawaii have no reciprocal agreements, but, with the exception of Florida, these states endorse diplomates of the National Board of Medical Examiners.

"Increases in the number of physicana registered last year as compared with data reported for the year 1944, were noticeable in a number of states and particularly in Arkansas, California, the District of Columbia, Florida Illinois Indiana Iowa, New Jersey, and the possessions, while more pronounced decreases in registration occurred in Georgia, Kansas, Kentucky Maryland, Michigan Mississippi, Missouri, Nebraska, Ohio, Pennsyl vania, and Virginia. The decreases in these states were most noticeable in the examination column

TABLE 1 - Licenses Issued, 1935-1945

		Reciprocity and	
	Examination	Endorsement	Total
1935	5 725	3 194	7 919
1936	6.375	2,772	9 047
1937	6 629	8,204	9,833
1938	6.557	2 956	9,518
1939	6.400	2,872	9,272
1940	6.289	2.866	9 155
1941	6.054	2,759	8,813
1942	6,141	2 460	8,010
1943	6,057	2,838	8,393
1944	7,038	2,580	9.647
1945	5,541	8 612	9 153
Totals	68.726	30 629	99,355

The high figures for the years from 1036 to 1941 in the annual number of licensee issued were due to the licensure of foreign graduates. In 1944 there was an increase of 1,254 over the number registered in the previous year while in 1945 there were 494 fower than in 1944. Acceleration started in most medical schools in the United States about July 1 1942, and the peak of graduates was reached in 1944, when two classes were graduated at most schools. The total graduates for the four-session three-year cycle to July 1, 1945, was 20 662. For the four years, 1942 to 1945, inclusive 35,803 physicians received licenses. This figure includes physicians previously licensed who are migrating to other states and veteran medical officers not returning to their original state of practice. It is believed that the great majority of recent graduates will have been licensed prior to entry on active duty with the armed forces. Discontinuance of the A.S.T. and Navy V 12 programs in medical schools at the end of the session which, for most schools, ended in March, 1946, per

mits schools to decelerate and most, if not all, schools are planning to discontinue the accelerated program

The 5,929 examinees represented 4,928 graduates of approved medical schools in the United States, of whom 2.5 per cent failed 53 were graduates of approved Canadian schools, 161 per cent of whom failed, 25 were graduated from approved medical schools no longer operating with 24.0 per cent failures, 475 were graduates of faculties of medicine located in countries other than the United States and Canada 56 0 per cent of whom failed and 448 were graduates of unapproved schools with 40.8 per cent fallures The numbers examined in these categories depart significantly from the figures for the year 1944 The number from approved schools in 1945, while considerably lower than in 1944, is in excess of the normal number of annual examinees but cannot be compared with 1944 owing primarily to the accelerated program Figures from the latter year represent two graduating classes in many in-stances, namely, December 1943, and September, 1944 There were considerable reductions among foreign graduates and graduates of unapproved schools New York where the greatest number of foreign graduates are tested, examined 190 fewer than in 1944. New York schools had 725 graduates try examinations of whom 20 failed or 3 8 per cent. New York graduates appeared before examining boards of 28 states,

'Graduates of medical schools of other countries were examined in 25 states the District of Columbia, and Puerto Rico There were 475 such graduates

with 266, or 56 per cent failures

The source of examination is further tabulated in Table 2 giving totals for five groups, namely, approved medical schools in the United States and those in Canada, schools no longer in existence, foreign faculties of medicine and unapproved institutions. As previously mentioned 2.5 per cent from the United States schools failed, as did 15 1 per cent of graduates from Canadian schools. The greatest percentage of failures represented two groups, foreign and unapproved schools. In these two categories 56 and 40 8 per cent, respectively failed. Of extinct schools 24.0 per cent failed

Consolidated Examinations A more accurate picture of the performance of graduates in licensure examination than the foregoing is given by the figures which combine the results of state medical board examinations with those of Part III of the National Board examinations (Table 3) In 1945 there were 4 928 graduates of approved medical schools in the United States examined by medical licensing boards, of whom 2.5 per cent failed. In the same period 1 219 graduates of these institutions appeared for Part III of the examination of the National Board of Medical Examiners, of whom 2.4 per cent failed. In some instances, schools having a high percentage of failures before the National Board of Medical Examiners in these consolidated of Medical Examiners in these consolidates

figures for 6,147 graduates, the percentage of failures of approved medical schools in the United States was reduced to 2 2

746

The total of all examined before medical licensing boards was 5,929, of whom 5,341 passed, and 588, or 9 9 per cent, failed For both groups—state boards and the National Board—7,160 were examined, 6,559 and 601, or 8 4 per cent, failed

Failures "Practically all states require the applicant to receive a general average of 75 per cent, and 50 per cent in any one subject. In case of failure in not more than two subjects, the applicant is entitled to another examination in those subjects within twelve months. A few states consider such individuals as conditioned in the subjects in which they failed and do not report them to the office of the Council on Medical Education and Hospitals of the American Medical Association, as failures. In these instances they are not considered in the calculations in this study. When their grades are raised after a successful test in the subjects in which they failed, they are recorded among those who passed. "In 1945 there were 9,153 individuals licensed or

"In 1945 there were 9,153 individuals licensed or granted licenses to practice medicine. Of these, 381 had previously been unsuccessful before a licensing board. From the approved schools, 170 of those licensed had previously failed a state board examination. Sixty-nine had one failure before being licensed in a given state, and 62 were licensed after one failure in another state. Thirty-nine received licenses after more than one failure, sixteen of whom were registered in the original state, nineteen elsewhere, and four failed in the state where licensed and elsewhere.

"One hundred and sixty-seven graduates of foreign faculties of medicine and 44 graduates of unapproved institutions were licensed after previous failure. The multiple failures shown for these two groups reveal the difficulty these individuals experience in passing licensure tests. In the computation of these statistics, the record indicated that 39 graduates of foreign faculties of medicine, eight graduates of unapproved institutions, and six from approved schools failed five or more times before licensure. Of the foreign graduates, fourteen had five failures before obtaining a license, seven failed six examinations, five failed seven, four, eight, three, nine, one each, ten, eleven, and twelve times, two,

thirteen, and one failed fifteen tests
"The eight graduates of unapproved institutions failed as follows—five tests, two, six tests, three, seven tests, one, and one graduate failed 21 tests, and another 30 tests, all in Massachusetts, before securing licensure in that state—The majority of these physicians with multiple failures were Massachusetts and New York examiness—In sixteen states, all physicians licensed last year had no failure in a state medical examination before being regis-

tered With the exception of California, Connecticut, the District of Columbia, Illinois, Massachusetts, New Jersey, New York, Ohio, and Pennsylvania, the number of physicians licensed throughout the country in each state after previously having failed was less than ten"

Reciprocity and Endorsement Four states, Florida, Idaho, Massachusetts, and Rhode Island, as well as Hawan, do not maintain reciprocal agreements with regard to medical licensure. However, all of these, excepting Florida, will register diplomates of the National Board of Medical Examiners.

"California issued 708 licenses by this method, New York, 512, and New Jersey, 236 Seven other states endorsed 100 or more candidates, namely, the District of Columbia, 177, Michigan, 160, Texas, 145, Massachusetts, 143, Ohio, 127, Connecticut, 105, and Maryland, 101 The largest numbers of candidates presenting the same type of credentials were the 1,103 presenting certificates of the National Board of Medical Examiners On the basis of the National Board's certificate, 407 were certified by New York and 143 by Massachusetts

"More than 100 physicians presented licenses issued in Illinois, Maryland, Michigan, Missouri, New York, Ohio, Pennsylvania, and Tennessee The greatest number (298) were licensed on the basis of previous registration in New York"

Eight were admitted to private practice in the Virgin Islands on presentation of satisfactory credentials Twenty-six medical officers of one of the government services received licenses without written examination in seven states California eleven, Texas four, Wisconsin four, Illinois three, Virginia two, Kentucky one, and Utah one

Two physicians were licensed in the District of Columbia and one each in California and New York on credentials from one of the possessions of the United States The foreign credentials of eight physicians were accepted as a basis for licensure without examination Arizona (Canadian license), Delaware (England), New York (Canada, Manitoba, Austria, France, and Germany), and Vermont (Quebec)

The number of physicians securing licenses by reciprocity or by endorsement has been steadily increasing in recent years. The figure for 1945 (3,612) represented 1,023 more licenses issued by this method than in 1944

Licentiales Representing Additions to the Medical Profession "There were 5,707 additions to the medical profession in 1945. The number removed by death in the United States, possessions, and temporary foreign in the same period was 3,815. It would appear, therefore, that the physician population in the United States last year was increased by 1.892.

"The greatest number of physicians in any one

state, 616 was added to the profession in New York. Both California and Pennsylvania added more than 400 and Illinois and Ohio more than 300

"The 5,707 licentiates constituting addition to the medical profession last year represented 4,939 who secured their licenses by examination and 768 by endorsement of credentials. The latter represent mainly diplomates of the National Board of Medical Examiners

"Estimated figures indicate that on January 1 1046 the number of physicians in continental United States including those licensed in 1045 and those still in military service was 195 809"

"At the Licensure for the Relocated Physician. request of the Committee on Postwar Medical Serv ice, the secretary of the Federation of State Medical Boards of the United States canvassed the respec tive licensing boards of the country on several points. The report of the secretary to the Federation on February 12, 1946 is as follows

'I Medical officers desiring to relocate after separation from military service will be required to satisfy peacetime licensure regulations in the states concerned except in New York, North Dakota, and Pennsylvania, where special consideration is given

to such applicants.

"2. Medical officers who are graduates of unapproved medical schools will experience difficulty in obtaining licensure in any state except Illinois and Massachusetts, although New York is giving special consideration to medical officers.

'3 Medical officers who entered military service without obtaining a license to practice in any state with the exception of diplomates of the National Board of Medical Examiners, will be required to take the regular licensure examination in the state where they expect to practice

"4. A limited number of states have provision for temporary licensure, but only for the duration of the war and six months thereafter

'5 As regards the licensure requirement for hospital residents which prevails in twelve states and the District of Columbia, and to a limited extent in four more states, it seemed evident that hospital residencies desired for returning medical officers should be regarded as a form of postgraduate or re-fresher courses of training and therefore these physicians might be relieved of licensure requirements particularly if restriction of practice is rigidly observed Several state boards are considering the matter in this light.

Graduates of Unapproved Schools Graduates from unapproved schools were admitted to examina Graduates tion in the State of New York under the conditions published in Annual Reports of The Medical Society of the State of New York for 1945 to 1946 by action of the Board of Regents, September 21, 1945, under paragraph 2, Section 51 of the Education Law

This ruling allowed selection from three groups of

residents of the State of New York those residents who had met all requirements for admission to professional licensing examinations, except graduation from an unapproved school, who had (I) practiced their profession in the armed forces, or (2) in the public health service during the War emergency or (3) under the same circumstances had been admitted to internalup in approved hospitals and thus con tributed to the public need during the emergency This latter opportunity (3) was made possible by an act of the New 1 ork State Legislature.

It was stated in the memorandum from Dr J Hillis Miller Associate Commissioner of Education, that 'in establishing this policy referred to above (see memorandum) the Board of Regents has made it possible for deserving veterans and a limited number of civilians to gain admission to the licensing examination who would otherwise have been denied

the privilege of taking the examination"
At a meeting of the Committee on Medical Licensure October 9 1946, Dr Jacob L Lochner, Jr . Secretary of the New York State Board of Medical Examiners, discussed various phases of licensure requirements and reported as follows

Report of the Counsel

To the House of Delegates, Gentlemen

Your Counsel herewith submits his report of the activities of the Legal Department of the Medical Society of the State of New York for the period from February 1, 1946, to and including January

31, 1947

During the year the personnel of your Counsel's staff has remained unchanged As of the first of the year 1947, however, your Counsel and his associate for many years, Mr Thomas H Clearwater, the Attorney for the Society, have formed a firm and are now engaged in the practice of law under Mr Clearthe name of Martin & Clearwater water's work as Attorney for the Society has been known to the members of the House for nearly seventeen years Mr Robert J Bell, who rejoined our staff after a period of service in the Navy, continues his good work in connection with the handling of malpractice actions, as does our other associate, Mr John J DeLuca Your Counsel pays tribute to the spirit of industry, loyalty, and devotion shown by his entire staff, both legal and clerical In making a report of this nature, brevity is a

necessary object, and it is possible only to give an outline of the work done by our Department Your Counsel in so reporting follows the convenient method whereby in previous years his activities have been divided into three main divisions (a) the actual handling of malpractice actions before courts and juries, and in the appellate tribunals, (b) counsel work with officers, committees, and individual members of the Society, and (c) advice on legislative matters and the activities associated

Litigation —Over the years your Counsel and his predecessors have pointed out the dangers which result from hasty, careless, and unjustified criticism by one physician of the work of another The average layman is very conscious of litigation and it takes but little to stir up a malpractice action Often, the doctor who makes the careless remark does not intend harm to the other nor does he feel the latter has been guilty of malpractice, but it is time and time again demonstrable that malprac-

tice actions stem from such comments

We likewise again call to the attention of the membership the ever-present hazard of becoming defendants in malpractice actions. That hazard is not restricted to any class of specialists but is very real to every physician who deals with patients, regardless of the type of his practice. It should be remembered that the rights of physicians in malpractice actions are dealt with by lay jurors who have very little realization or understanding of a physician's problems, and who are likely to be swayed by considerations of sympathy or prejudice, and by other factors unrelated to the ments of a In keeping with the trend of the times, it is a well known fact that verdicts in all sorts of personal miury actions are larger than was the case a few years ago

It should be noted in this connection that for many years the Society has sponsored a Group Plan of insurance in an attempt to take cognizance of these conditions The excellent record of the Group Plan has continued The Society furnishes gratis defense, through your Counsel, to members who are sued for malpractice who carry no insurance However, though such defense is valuable to a physician, he may find himself in a difficult position,

indeed, if the case is one which will result adversely Adequate protection in the Group Plan to avoid such a consequence is recommended to every member Although the number of members insured under that Plan is at this time greater than ever before, there is still a large number of members who carry no insurance protection against mal-practice. During the calendar year 1946, eighteen such lawsuits were instituted against uninsured physicians whose defense was undertaken by your Counsel Each one of them certainly regrets his failure to take advantage of the Group Plan, which has been in operation for nearly thirty years

The Yorkshire Indemnity Company, the carrier for the Plan since 1936, has in every way continued to fully and fairly discharge its obligations and to cooperate in every way with your Counsel in the defense of cases covered A word of appreciation should be expressed for the work of Mr Horace Crowell, Jr, assistant secretary of the Company, in charge of the claim department, and of the work

of his subordinates

Your Counsel feels that a forward step was taken at the 1946 meeting of the House of Delegates by the creation of a Special Committee known as the Malpractice Insurance and Defense Board Board has been set up under the able chairmanship of Dr J Stanley Kenney, and has undertaken the discharge of its duties Your Counsel and Mr Clearwater have attended the meetings of the It has the important advantage over the old Committee that it will provide a continuity of supervision over malpractice insurance and defense by members who will remain in office long enough to become thoroughly familiar with the many problems involved

With these preliminary statements we note that there were commenced within the present reporting period 125 actions This is an increase over the 111 actions commenced in the last reporting period, but is not nearly so large as the proportionate increase over the period prior thereto which was from 90 to 111 These increases can be in large part attributed to the fact that all but a very few of the physicians who were in the armed forces are now back in private practice A number of cases were instituted during the past two years which would have been begun sooner had not the parties to the actions been in service. The figure of 125 new actions, on the other hand, is much less than the average of cases instituted during the years which preceded the outbreak of the war These figures do not include a large number of claims outstanding on which suit may be eventually brought constantly in conference with many claimants and their attorneys, and frequently have succeeded in convincing them that in fact and in law their claims are without merit, so that many such claims never become lawsuits

Table 1 shows that during the present reporting period we disposed of 98 cases Sixty-eight of these cases were settled and 30 terminated successfully in favor of the physician In no cases were there

Judgments for the plaintiff
There were pending, at the end of the reporting
period, approximately 400 cases

Counsel Work.—During the period of this report, your Counsel and Mr Clearwater, the Attorney for the Society, have attended the Annual Meeting

of the Society, and the regular meetings of the Council and of the Board of Trustees and have conferred with members of those bodies, and members of committees upon numerous legal problems that have arisen. With the increase in the activities of the Society this work has increased in considerable measure

During this period your Counsel and Mr Clear water devoted much time and energy to the legal details attendant upon the formation and organization of a membership corporation entitled Veterans Medical Service Plan of New York, Inc. and to the negotiations involving that corporation the Society and Veterans Administration whereby the present system of furnishing medical care to veterans was

put into effect.

Your Counsel prepared the contracts which are now in effect between the Society and Mr Dwight Anderson Dr David J Kaliski, Dr Robert R. Hannon and Mr George P Farrell. He also prepared the contracts entered into between the Society and the firm of Hackeling & Oberkirch accountants, providing for the annual audit of the Society's financial alfairs, and for an audit of the Group Plan We have participated in further negotiations regarding the leasing of larger quarters for the Society's office.

Your Counsel, acting with the Committee on By laws, has examined a large number of proposed amendments to the Constitutions and Bylaws of a number of component county medical societies and has rendered solvies and made suggestions in connec-

tion therewith

We have been in frequent consultation with Mr Anderson, Dr Anderton, and Dr Kaliski relative to legal phases of problems which have arisen in their particular fields of work. Mr Clearwater and Mr Bell attended on behalf of the Scenty, certain disciplinary proceedings under the Workmen's Compensation Law

In addition, your Counsel receives many oral and written requests for opinions from various members on topics too numerous to mention in detail in this report. A few of the matters on which such advice has been given during the past year are the following personal liability of a salaried physician in a Stato locapital, right of physician to engage in medical practice as partner, legality of sterilization operation, legal liability of psychiatrist and psychoanalyst, disclosure of information to insurance company, right of physician to advertise manufactured products, sale of medical practice, termination of professional relationship with patient, own erslup of x ray plates, discharge of physician from hospital staff, right of physician to purchase grain alcohol, and necessity for preservation of hospital record including x ray films.

It should be noted that your Counsel's office is at

It should be noted that your Counsel's office is at the service of all members of the Society, and it is a daily occurrence for us to be consulted either by personal inquiry or by telephone concerning the legal problems arising out of emergency situations which cannot be handled by correspondence We endeavor to render assistance in these situations, which, of course, entails a considerable amount of

time and work

Legislative Advice and Activities —During the reporting period, your Counsel and Mr Clearwater have conferred with numerous persons in connection with proposed changes in the law which affect the practice of medicine and the medical profession Such problems have been discussed at length with the Society sofficers and committeemen, and with Dr Hannon the Executive Officer Mr Clear water attended the annual meeting of the Council Committee on Legislation with the chairmen of the County Society Legislation committees at Albany He also conferred concerning proposed legislation on several occasions with representatives of the hospitals and of various medical specialities.

Conclusion.—Your Counsel closes his report as he and his predecessors have in other years, by an preseng his appreciation of the advice and assistance given throughout the entire State by many members of the Society who have helped us in the handling of litigation, and in our numerous problems. The officers of the Society and the members of the Country and Board of Trustees have aided and assisted us in great measure. Such cooperation has enabled your Counsel to obtain the results shown in this report.

Respectfully submitted, WILLIAM F MARTIN Counsel

Resume of Instructions of the 1946 House of Delegates and Actions Thereon of the Council, Board of Trustees, and Officers

Upward Revision in Fee Schedule of Workmen's Compensation Law (Section 43) —As instructed by the House of Delegates, the Workmen's Compensation Bureau reiterated its previous request for upward revision of the fee schedule Dr Hale wrote Miss Mary Donlon, director of Workmen's Compensation Board, to this effect Miss Donlon has appointed the following committee to make recommendations to her Dr Nathan B Van Etten, Chairman, Honorable E W Edwards, representing labor, Mr Martin F Hilfinger, president of Associated Industries, Buffalo, Mr Henry D Sayer, manager, Compensation Insurance Rating Board, Dr W P Anderton, representing the Medical Society of the State of New York Dr Francis M Conway and Dr Joseph Raphael of the Medical Practice Committee, Workmen's Compensation Board, sit as advisors to the Chairman, and Miss C Hafele, executive secretary, Workmen's Compensation Board, acts as secretary This Committee has already held meetings and is studying the matter referred to it, which has many ramifications

Reintroduction of Amendments (Section 43) — The Committees on Legislation and Workmen's Compensation, acting in unison, have had introduced into the 1947 session of the New York State Legislature an amendment to the Workmen's Compensation Law abolishing the Medical Practice Committee and restoring to the Medical Societies of the counties of Bronx, Kings, Queens, and New York the functions performed by the Workmen's Compensation Committees prior to the establishment of the Medical Practice Committee in 1944 No action on this matter has been taken by the legislature as this goes to press

Medical Care of Veterans' Service-Connected Disabilities by Private Physicians (Section 55)—As a result of authorization by the House, the Council fostered the creation of Veterans Medical Service Plan of New York, Inc This corporation has been functioning for several months in cooperation with the Council Committee on Lauson with the Veterans Administration

Overlapping of Committees —With the consent of Council, Dr Hale referred this matter to the Planning Committee The Planning Committee has studied this subject and will make recommendations to the Council In February, 1947, the Council Committee on Veteran's Affairs was discharged with thanks

War Memorial (Section 59) —In a report of the Finance Committee published elsewhere, it reports to the House the study regarding a proposed memorial fund for the advanced education for children of members who died in Service during World War II The Committee makes recommendations regarding the collection of such a fund, and renders its estimates

Establishment of Fund for the Sole Purpose of Meeting Counsel Fees in Malpractice Suits (Section 61) —See report of Malpractice Insurance and Defense Board to be published in April 15, 1947 issue of the JOURNAL.

Malpractice Defense and Insurance Resolution (Section 62) —

"Resolved, That the House of Delegates direct

that the Medical Society of the State of New York through its counsel submit a report to the Comitia Minora of each County Medical Society on the number of members insured in the Group Plan in said county, number of suits in said county (against insured, against noninsured), number of suits dropped, number of suits settled and amounts, and the number of judgments and amounts'

"Referred to the Council for study"

It was voted by the Council to refer this to the Malpractice Insurance and Defense Board, and that the Board confer with Counsel

See report of Malpractice Insurance and Defense Board

Malpractice Defense and Insurance Resolution.—Yearly Audit (Section 63) —The House directed a yearly audit be made including inspection of vouchers of the Group Plan by certified public accountants to be submitted to each County Medical Society Comitia Minora This subject was referred by the Council to the Malpractice Insurance and Defense Board After careful study, the Board recommended to the Council that the Board of Trustees be requested for an emergency appropriation of \$2,000 to pay Messrs Hackling and Oberkirch, public accounts The Board of Trustees made this appropriation and the audit was undertaken, and it is hoped at the time of this writing that the report will reach the various Comitiae Minorae well in advance of the Annual Meeting

Basic Science (Section 78) —The House recommended that the Council and Executive Officer should study all proposed legislation which aims at the elimination of cult practices. An exhaustive study of laws in many states, relating to cult practice and including consideration of basic science laws, was undertaken by Dr. Robert R. Hannon, Executive Officer, Mr. Dwight Anderson and Mr. Thomas E. Walsh of the Public Relations Bureau, and others. Using this as a basis, the Legislative Committee has submitted to the Council a comprehensive report which has been sent to the New York State Journal of Medicine for publication.

Creation of a Committee Dealing with the Relationship of Doctors and Hospitals (Section 84) — The Council voted to broaden the duties of the Joint Committee of the New York State Hospital Association and the Medical Society of the State of New York to consider and study this subject

Car Priorities for Veterans and Other Physicians (Section 86) —Dr Edward P Flood introduced a resolution in the House of Delegates of the American Medical Association urging car priorities for veterans and other physicians. This was adopted and referred for action to the Committee on Postwar Planning. The New York State Journal of Medicine, Vol. 47, No. 3, February 1, 1947, page 295, contained a letter to Dr Flood from Dr Ernest E Irons, Chairman, Joint Committee for the Coordination of Medical Activities of the American Medical Association—the successor committee to the Committee on Postwar Medical Service. Dr Irons explains that "the automobile manufacturers have been cooperating to a considerable extent

through the local dealers' and that they are doing all they possibly can. He further states that the Committee 'will continue to exert such pressures as it can.

Hospital Training for Professional Graduates (Section 87) -

"WHEREAS hospital experience is universally recognized as a basic part of professional train

ing, and
WHEREAS, such training is not at present required by our Medical Practice Act, be it
Resolved That the House of Delegates actively promote legislation requiring the Medical Practice Board to grant a license only to those

who have spent a year after graduation in a hospital approved by the Board of Regents.
Referred to Council for study and report at

next Annual Meeting
It was voted to refer this to the Medical Prac-

tice Study Committee. The Committee decided to postpone action until another year

Establishment of Speaker's Bureau (Section 88)

The House voted that a Speakers Bureau be established either under the Council or its Committee on Medical Service and Public Relations with action through the State and county societies voted that all lay and county associations be notified of the existence of this Bureau _ The House author ized the Council to request the Board of Trustees to appropriate \$5 000 for the first year of operation of such a Bureau The Council referred this matter to the Committee on Medical Service and Public Rola tions and, as a result, Mr. Thomas E. Walsh of the Public Relations Bureau has made a survey through out the State. The results of this will be found in the report of the Committee on Medical Publicity

American Medical Association Resolutions.—In addition to the Car Priorities Resolution (q v) two others were introduced in the House of Delegates of the American Medical Association according to instructions of the House of Delegates of the Medical Society of the State of New York. Dr John J Masterson introduced a resolution recommending a change in the Federal Workmen's Compensation With two minor changes in verbiage this resolution was passed.

Dr Herbert H. Backus introduced a resolution regarding promotion of national health which was also adopted

These resolutions have been published in the report of the House of Dalegates in the Journal of the American Medical Association

Amendments to the Constitution and Bylaws

In accordance with Article XIII of the Constitution and Bylaws the following proposed amend ments are published for the information of the House of Delegates and will be considered at its next meet-

Proposed Amendment to Chapter IX, Section 1

Introduced by Dr Stephen H. Curtis, Delegate of Section on Pathology and Clinical Pathology In Chapter \(\) Section 1 of the Bylaws it is recommended that following the words, Prendents of the District Branches' add the following words to be italianced and delegates from the Scientific Sec-tions. The sentence would then read in full

"Presidents of the District Branches and delegates from the Scientific Sections sitting in the House of Delegates shall be allowed reasonable expenses."

Creation of Membership Classification for Physiclans Employed by Veterans Administration or Serving in the Regular Army or Navy Medical Corps

Introduced by Dr Samuel B. Burk, New York. Amend Article 2 of the Constitution by adding

after the word "Honorary" the following Associate' and place the period after the word

Amend the Bylaws by adding a section to be known as Section 8 at the end of Chapter 1 of the Bylaws as follows

'Section 8 The Associate Members of this Society shall be graduate physicians who are affiliated full-time with the Veterans Administration or are serving on permanent appointments in the regular Army or Navy Medical Corps who are stationed temporarily or indefinitely within the State of New 1 ork and who shall have been admitted to a corresponding form of Associate Membership without cots, in a component county medical society of the Medical Society of the State of New York shall pay the regular assessments of the State Society in the same manner as active members. The specific requirements for admission as an Associate Member shall be established by each of the component medical societies

Dr James F Rooney, Albany, gave note of General Amendments to the Bylaws.

Reports of the District Branches

First District Branch

To the House of Delegates, Gentlemen

The activities of the First District Branch for the year have been carried on along the orthodox lines with a meeting of the Executive Committee of the Branch held at the Hotel Roger Smith, White Plains, on June 13, 1946, which was exceedingly well attended The affairs of the Branch in general were discussed and particularly the type of program for the annual meeting in the summer It was decided that with the end of the war it would be feasible to go back to the clinical type of meeting held in a hospital, and it was the sense of the meeting that the Veterans Administration Hospital, at 130 West Kingsbridge Road, Bronx, would be open to such a suggestion, and that this would be especially likely in view of the fact that their staff of part-time attending physicians and surgeons from the medical schools of New York had now been rather well-organized, and it would be a grand opportunity for the hospital to demonstrate the workings of this new form of organization within the regular framework of the Veterans Administration

General R. G DeVoe, Commandant of Veterans Administration Facility 81, accepted the invitation with enthusiasm, and during the summer the details of the program were worked out as follows At the morning session from 9 00 to 12 00 an operative surgical clinic was held and from 10 00 to 12 00, a medical clinic with presentation of cases 12 00 a buffet luncheon was served and a business

meeting took place

The afternoon session included panel discussions on duodenal ulcer and on coronary artery disease from 2 00 to 4 00, and at 4 00 a tour of the Hospital

At the end of an excellent luncheon served by the Veterans Administration, Dr DeVoe welcomed the guests at the meeting, stressing the importance of the professional side of medicine as it applies in the Veterans Administration

At the election of officers which followed, these were elected president, Harold F Morrison, M D, Tuxedo Park, first vice-president, Stephen R. Monteith, M D, Nyack, second vice-president, William Crawford White, M D, New York City, secretary, I J Landsman, M D, Bronx, and treasurer, Henry W Miller, M D, Brewster

Dr. Smith spoke briefly on the position that the

Dr Smith spoke briefly on the position that the District Branch holds in the State Society organization and urged its importance as occupying the middle ground between the County Society meetings and the more distant meetings of the State Society

Dr William Hale, President of the Medical Society of the State of New York, in making the last of the eight District Branch addresses which fall to the lot of the President of the State Society, brought the greetings of the Medical Society of the State of New York to the First Branch He spoke at considerable length about the Veterans Medical Service Plan of New York, Inc , the details of which have been published elsewhere, but his discussion of the negotiations leading up to the formation of the plan was most interesting and instructive He then discussed the progress made by the various Blue Cross Plans in the State and the associated Medical Service Plans, which are becoming more and more active throughout the State He urged the doctors as individuals to get behind these plans and give them their enthusiastic support Finally, he brought up his favorite theme, one which we all

endorse, which is the vital importance of the county medical society as a basic organization for all organized medical work, and the key position in that Society which its secretary occupies In conclusion, he said, "Today we are faced with threats to the independence of our profession. We are also subjected to challenges. We cannot fight the threats or meet the challenges unless we stand together and constantly renew our interests in every problem touching the medical profession. Let us always be ready with advice and assistance in helping to solve medical economic problems, and let us never be dazzled by rosy schemes which will compromise the integrity of our profession and the medical care of our patients "

This was followed by an address by Mrs Alfred L Madden, President of the Woman's Auxiliary to the Medical Society of the State of New York, who discussed the place and importance of the Woman's Auxiliary, especially from the public relations angle, and the support it can give in carrying out the many organizational changes which confront medicine at

the present time

Finally Dr Theodore E Allen, of the American Academy of Pediatrics, outlined the Academy's plan for a complete, over-all survey of all health facilities in the United States for children, and its importance in giving a picture of the adequacy of

child care in this country

The scientific program in the morning consisted of an operative surgical clinic, which included three subtotal gastrectomies and one exploratory for pancreatic heterotopia The morning medical clinic presented the following cases (1) coccidiomycosis, (2) Addison's disease, (3) arteriovenous fis-tula, (4) polyarteritis nodosa, (5) cavernous trans-formation of the portal vein, and (6) pulmonary amebiasis. The afternoon session was devoted to two panel discussions The first on duodenal ulcer was under the chairmanship of Dr Fred Bancroft, with Dr George C Adie, Dr Charles Flood, Dr John Kantor, Dr Foster Kennedy, Dr Howard F Shattuck, and Dr Cranes Weeks participating The second, with Dr Bernard Straus as chairman, was on coronary artery disease, with Dr Louis F Bishop, Jr, Dr Arthur C DeGraff, Dr Irving Graef, and Dr Harold J Stewart participating Both were most illuminating and thorough, and received high praise from those present

The official list of those present at the meeting totals only 141, but many doctors from the Bronx, Manhattan, and Westchester failed to register The attendance by counties and foreign countries

was interesting to note

Bronx, 34, Dutchess, 12, New York, 40, Orange, 9, Putnam, 1, Ruchmond, 1, Rockland, 4, Westchester, 26, others, 11, Australia, 1, Mexico, 1, and China, 1

Respectfully submitted, SCOTT LORD SMITH, M D, President

February 7, 1947

Second District Branch

To the House of Delegates, Gentlemen

The fortieth annual meeting of the Second District Branch of the Medical Society of the State of New York was held on October 23, 1946, at the Garden City Hotel

The morning session was devoted to a panel discussion on Diseases of the Heart' with Dr Edwin P Maynard Jr of Brooklyn, as chairman The panel consisted also of Drs. Louis H Bauer of Hempstead Charles A R. Connor, of New York City and Harold E B Pardee of New York City, who conducted an absorbing review of the latest knowledge on cardino conditions, particularly from the viewpoint of treatment. It was the general feeling that the panel discussion type of presentation was highly satisfactor, and that the members of this particular panel out-did themselves in making their discussion lucid, concise, and informative

At luncheon we were joined by the woman a auxiliaries of the four counties. After a short busi ness meeting at which Dr John B D Albora, of Kings County was elected president for the coming two years we were addressed by Dr William Hale, President of the Medical Society of the State of New York and by Mrs Alfred L. Madden, Presi dent of the Woman's Auxiliary Both made stimu lating speeches on social and economic aspects of the

practice of medicine.

The day's session was closed by an address on "Medical Care for Veterans' by Dr. Frederick E. Lane chief of the Outpatient Division Branch No. 2 Veterans Administration This was a highly informative and timely exposition of the new plans for the treatment of veterans by civilian physicians. Considerable discussion followed

The meeting was attended by 136 physicians including 64 from Nassau County, 27 from Lings 19 from Queens and 15 from Suffoll.

It was a pleasure to have with us Dr W P Ander ton, Dr J Stanley Kenney Mr Dwight Anderson, Mr George P Farrell Miss Yolande Lyon, and Dr Theodore E Ailen all of New York City, and Dr Robert R. Hannon of Albany

The Branch is again indebted to its efficient secretary-treasurer Dr Charles F McCarty, for the ar

rangement for the luncheon

Respectfully submitted.

EVERUTT C JESSUP M D President

February 3 1947

Third District Branch

To the House of Delegates Gentlemen

The fortleth annual meeting of the Third District Branch of the Medical Society of the State of New York was hold on Thursday September 19 1946 in the Governor Clinton Hotel Kingston New York. The registration of 84 was much too small for seven important counties in this state. The business session was begun at 10 30 A.H. with Dr John L. Edwards of Hudson presiding. The secretary s and treasurer's reports were accepted as read

tary and treasurer's reports were accepted as read A nominating committee, consisting of Drs M K. Colley, of Catskill, E. Shea, of Stone Ridge, and E C Bliss, of Hudson, was permitted to cast one ballot and the following officers were elected for 1947 president, Frederic W Holcomb, M.D Kingston, first vice-president, Harry Colembe, M.D Liberty second vice-president, William C Rausch, M.D. Albany secretary Donald R. Lyon M.D. Middleburg and treasurer William M Rapp, M.D Catskill A clinicopathologic conference with cases pre-

A clinicopathologic conference with cases pre-sented by Drs. Harold L. Rakov Edward F Shea,

Frederic W Holcomb, followed by a pathologic summary by Dr J Spottiswood Taylor, was ex ceedingly interesting and instructive. Recess was followed by a luncheon The late Dr William Hale President of the State Society, then spoke in favor of medical care administered and controlled by the profession. He also said that the component units do not make improper agreements with agencies and that proper fee schedules be set up, that the present Veterans Administration type of medical care and compulsory medical insurance for all people is not going to work, that the prepayment medical care plans are worth while and that they need our substantial support.

Mrs. Alfred L Madden President of the Woman's Auxiliary then spoke of plans to increase their membership and scope of value to the profession and said that those in attendance could help by encouraging their wives to become active members

The afternoon session was opened by Dr Harry Gold of New York City, whose talk on "Manage-ment of the Falling Heart' seemed to make this branch of the Faing Heart Seemed to Make this branch of medicine too simple because of the clear-ness and sincerity of his address. The surgical paper was presented by Dr. Herbert C. Maler, of New York City who spoke of the "Diagnostic and Tharapeutic Problems in Surgical Diseases of the Thorax. His exceptional knowledge of the subject and his splendid delivery gave us a new conception of chest disease management

On the whole this was one of the best meetings

this group has had

March 1 1947

Fourth District Branch

To the House of Delegates Gentlemen.

The executive council of the Fourth District held a meeting June 21, 1946, at Glens Falls, at which time it was decided to hold the annual meeting at Schenectady, September 21 1946, and have a literary program during the dinner and afternoon with an address by the State President during the evening.

The literary program consisted of a symposium on tumors Papers were given by Dr. Frederick F McGauley, attanding surgeon, Ellis Hospital, Schenectady, Dr Norman L. Higinbotham, attending surgeon, Hospital for Special Surgery New York City and Dr George T Pack, Memorial Hospital, New York City assistant professor of clinical surgery, Cornell University Medical College.

It was a very successful and instructive meeting Total strandance was 80—68 from the District

Total attendance was 80-68 from the District

and eleven visitors

The following officers were elected for the ensuing year president, Dr Denver M Vickers, Cam bridge, first vice-president, Dr Joseph A. Geis year products the president, Dr Joseph A. Gens Lake Placid, second vice-president, Dr Gilberto B. Pesquera, New York City, secretary Dr William E Gasaley, Schenectady treasurer Dr J Frederick

Respectfully submitted F F FINNEY, M.D., President

Fifth District Branch

To the House of Delegates, Gentlemen

The officers of the Fifth District Branch of the Medical Society of the State of New York, the Presidents of the component county societies, and several guests met at the Hotel Syracuse on Friday, June 7, 1946, to prepare the annual fall program It was decided on the suggestion of the President, Dr Sherman M Burns, to restrict the discussions to the social and economic topics that were affecting

the present day practice of medicine

The fortieth annual meeting was held at the Hotel Syracuse on September 17, 1946 The following was the program for the afternoon session "The Care of the Veteran" by Dr Richard S Farr, of Syracuse, and "The Effects of Social Trends on Medical Care" by Dr Leo E Gibson, of Syracuse These papers were heard by a large attendance which represented a substantial proportion of the entire district There was an interested and stimulating discussion The meeting was conducted by the First Vice-President in the absence of Dr Burns, of Oswego, who could not be present because of illness in his

The evening meeting was opened by a banquet in the large ballroom. The main speaker was the Honorable Robert A. Taft, United States Senator from Ohio, whose address, "Medical Care," was carried over an eastern radio network. This talk was enthusiastically received by a large audience which included not only the members and their quests but invited personner editors and interested. guests, but invited newspaper editors and interested Mrs Alfred L Madden spoke on Voman's Auxiliary Dr William political figures Mrs Alfred L Madden spoke on behalf of the Woman's Auxiliary Dr William Hale, President of the Medical Society of the State of New York, spoke on social matters of interest

to the profession

The members of the Fifth District Branch were saddened to learn of the sudden death of the President, Dr Sherman M Burns, in December, 1946 Dr Burns was an enthusiastic officer of this branch, and it was through his single-handed efforts that this splendid program had been carried out so success-His work, advice, and friendship will be missed by all who were active in the Fifth District Branch and by his many friends at large within and without the profession

> Respectfully submitted H D VICKERS, M D , President

Sixth District Branch

To the House of Delegates, Gentlemen

The fortieth annual meeting was held September 25, 1946, at the High School, Waverly, New York There were 100 members and guests present

At the afternoon session the speakers were Dr Marvin F Jones, surgeon-director of the Manhattan Marvin f' Jones, surgeon-director of the Manhattan Eye, Ear and Throat Hospital, New York, whose subject was "Functional Disorders of the Ear," and Dr Edward G Waters, assistant clinical professor of obstetrics and gynecology, College of Physicians and Surgeons, Columbia University, New York, who spoke on "The Fascial Planes of the Pelvis," and also presented his operation on "Extraperitoneal Scotton"

Following dinner and introductions of the officers of the Medical Society of the State of New York who were present, the President of the State Society, Dr William Hale, addressed the meeting ing the President's address, Mrs. Alfred L. Madden,

President of the Woman's Auxiliary, spoke on the activities of the Auxiliary

The scientific program of the evening session was Dr Frank W CoTui, devoted to two speakers assistant professor of experimental surgery, New York University, College of Medicine, discussed the "Clinical Use of Protein Hydrolysate" and Dr Frank W Reynolds, of Baltimore, Maryland, spoke on "Penicillin in Syphilis"

The meeting was adjourned at 10 30 P M

Respectfully submitted,

IVAN N PETERSON, M D, President

February 4, 1947

Seventh District Branch

To the House of Delegates, Gentlemen

On June 6, 1946, the presidents of the component county medical societies met with Dr Robert R. Hannon, Executive Officer, and Drs Floyd S Winslow and James M Flynn, to arrange for the

annual meeting

The fortieth annual meeting was held on September 26, 1946, at the Rochester Academy of Medi-The program at the morning session consisted of (1) selected motion pictures, (2) "Methods of Psychotherapy in Medical Practice" by Dr John Romano, professor of psychiatry, University of Rochester, School of Medicine and Dentistry, (3) "Abdominal Perineal Proctosigmoidectomy without Colostomy and with Preservation of Sphincter Muscles" by Dr Harry E Bacon, professor of proctology, Temple University School of Medicine, Phylodelphys. Perinsylvania. Philadelphia, Pennsylvania

Following luncheon at Rupert Gray Restaurant, officers of the Medical Society of the State of New York were introduced President William Hale, MD, delivered a fine address, and Mrs Alfred L Madden, President of the Woman's Auxiliary, also

At the afternoon session, Dr Albert D Kaiser, president, Council of Rochester Regional Hospitals, and Dr Milton G Bohrod, chief of laboratories, Rochester General Hospital, spoke on "Bone Marrow Aspiration in Diagnosis"

One hundred and fifty-nine members registered from the Seventh District, and 19 from elsewhere

Respectfully submitted,

LLOYD F ALLEN, M D, President

February 13, 1947

Eighth District Branch

To the House of Delegates, Gentlemen

The annual meeting of the Eighth District Branch of the Medical Society of the State of New York was held on October 17, 1946, in Olean at the St. Bonaventure College The Eighth District Branch is very grateful to the faculty of Bonaventure College for their gracious hospitality and the excellent facilities they made available for the meeting There were 136 physicians in attendance for the scientific and business program. Four scientific addresses and a business meeting featured the day At the business meeting addresses were given by Dr William Hale, President of the Medical Society of the State of New York, and Mrs Alfred L Madden, of Albany, President of the Woman's Auxiliary of the State Society Mrs Madden expressed the willingness of the Auxiliary to serve in any capacity

possible in promoting and sponsoring Society activities Dr Porter A. Steele, President of the Medical Society of the County of Eric submitted a proposal for the activation of the Eighth District Branch to create a more coordinated and united group of the eight medical societies, that would operate all the year around The need for such activation was amplified by the enthusiastic response of the mem bers present

Mrs. M. G Sheldon, President of the Cattaraugus County Woman's Auxiliary, was hostess to the ladies of the various county auxiliaries

An organization meeting of the presidents and secretaries of the county medical societies comprising the Eighth District Branch was called by the District President during November 1946 Representatives from all eight counties reported for the meeting The officers of the Medical Society of the County of Erie were hosts. Plans for future activities of the group were discussed. Meetings are to be held quarterly in various sections of the Eighth District. The need of cooperative relationship of the medical societies of the Eighth District to promote and support activities of common interest was emphasized in the discussion The committee is to be designated as the 'Advisory Council of Presidents and Secretaries of the Medical Societies of the Eighth District. The President of the Eighth District. The President of the Eighth District Branch of the Medical Society of the State of New York was appointed Chairman of the Council.

The first scheduled business meeting of the Council was held in Buffalo on Thursday February 20

1947 Representatives from soven of the counties, totaling 23 in all, attended the meeting Several had traveled over 100 miles through stormy weather to be present. The agenda was highlighted by the consideration of bills of direct interest or concern to the medical profession now before the 1947 State Legislature. Discussions were led by Dr. Werner Rose County of Erie, Executive Officer Harold P. Jarvis of the same Society, Dr. Robert O. Peale, of Cattaraugus, and Joseph J. Guariglia, Secretary-Attorney of the Workmen's Compensation Committee of the Eric County Society. All members present participated in the discussion.

Resolutions supporting of opposing the various bills under discussion were passed by the Committee A roll call of all county society members and representatives resulted in the open consideration and cooperative support of numerous interesting matters

and local problems

The inauguration of an Advisory Council Depart ment for the Eighth District Branch, in the Bulletin of the Eric County Medical Society was announced by the Managing Editor Mr Harold P Jarvis. The February issue of the Bulletin contains a full page devoted to the activities of the Eighth District Branch.

The next meeting of the Council will be held on the evening of April 17, in the Hotel Statler in Buffalo, just prior to the 1947 State Convention in Buffalo of the Medical Society of the State of New

York May 5 to May 9

Respectfully submitted William J Orr, President

TEACHING DAY

Arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York

O W H MITCHELL M D, Chairman

Tuesday May 6, 1947

Memorial Auditorium—Meeting Room A Charles D Post, M D, Syracuse, Presiding

Part 1 OBSTETRICS AND GYNECOLOGY

9 30 A.M

1 THE PRACTICAL APPLICATIONS OF ENDOCRINES IN GYNECOLOGY

George P Heckel, M D, Rochester CAUSES OF FETAL MORTALITY

John S Labate, M D, New York

Part 2 PEDIATRICS

- 1 COMMON SENSE IN INFANT FEEDING AND THE USE OF VITAMINS
- A. Clement Silverman, M D, Syracuse
 NEWER KNOWLEDGE IN EXPERIMENTAL POLIOMYELITIS
 Claus W Jungeblut, M D, New York

Part 3 MEDICINE

2 00 PM

1 MEDICAL ASPECTS OF THE ATOMIC BOMB Joe W Howland, M D, Rochester 2 FIBROSITIS (MUSCULAR RHEUMATISM) INCLUDING DUPUYTREN'S CONTRACTURE A NEW METHOD OF TREATMENT Charles LeRoy Steinberg, M D, Rochester

Part 4 SURGERY

- DIVERTICULITIS OF THE LARGE INTESTINE Charles G Child, III, M D, New York
- 2 RECENT DEVELOPMENTS IN THE CARE OF PROSTATIC DISORDERS John E Heslin, M D, Albany

Each lecture will be approximately thirty minutes, followed by general discussion

These lectures are presented by the Medical Society of the State of New York with the cooperation of the New York State Department of Health

SCIENTIFIC EXHIBITS

Memorial Auditorium, Buffalo, May 5 to 9, 1947

J G Fred Hiss M D Chairman,

SYRACUSE

ALFRED H NOBHREN, MD, BUFFALO

DIFFERENTIAL DIAGNOSIS OF ABDOMINAL TOMORS

Samuel Brown M D Jewish Hospital Cincinnati Ceneral Hospital Cincinnati Oluo

Roentgenograms of stomach and duodenum in the anterior and lateral positions showing their relationship to their neighboring organs. Tumors of liver spleen pancreas, gallbladder extrahepatic biliary ducts and kidneys will be shown the diagnoss of which was determined by the characteristic changes each one of them produced upon the position, shape and contour of the stomach and duodenum.

COLD INJURIES OF THE EXTREMITIES

Irwin D Stein, M D Monteflore Hospital Bronx

Various types of cold trauma of the limbs are depicted and described by means of diagrams, charts water colors, and cblor photographs The pathogenesis, natural history complications, and treat ment are gone into in detail. The material comprises work done while in the Army, at Montefore Hospital and in private practice. Original investigative work in the involvement of the peripheral vascular system in these disorders is included

PROBLEM FRACTURES

O C. Hudson M D
W P Bartels M.D
C F Freese, M D
J C Felicetti M.D
C Bosile, M D
Nassau Hospital
Mincola

This exhibit will consist of translite films of fractures

TUMORS OF CHILDHOOD

Harold W Dargeon, M D Memorial Hospital New York

The exhibit illustrates some of the more common types of malignant and benugn tumors during child bood and indicates certain diagnostic critera. Statustical charts show the importance of neoplastic diseases as a cause of death among children. In the United States during 1941 1942 and 1948 cancer leukemia, and alculemia ranked third among all causes of childhood mortality between the ages of 3 and 10 years.

REHABILITATION OF THE TUBERCULOUS

The Potts Memorial Institute Inc Lavingston

Photographs of the institution including School of Buriness. Products of the Livingston Press and Homestead Candle Shop

HISTORY OF TUMORS OF BONE

Sigmund Epstein, M.D. New York

Paleopathology of tumors of cylindrical bones Early pictures of teratology Illustrations of bone tumors in preliations Americans. Illustrations of bone tumors before reentgen

BONE MARROW

Stuart L. Vaughan, M D Frances Brockmyre M T Janet Corbett, B C. Bullalo General Hospital Bullalo

The exhibit will show technic employed in collecting bone marrow samples and in making the examination results obtained from the analysis of somes of normal and diseased subjects, application of these studies to diagnosis, and microscopic demonstration of the marrow picture in a variety of conditions

THE GYNOGRAPH

(A New Instrument in the Diagnosis and Treatment of Female Sterility

Abner I. Weisman, M.D. Jewish Memorial Hospital New York

The exhibit consists of two parts (a) actual demonstrations on the model of the use of the gynograph With this new apparatus, the physician has a compact, portable machine with which he can perform either carbon dioxide tubal insuffiction, hysterosalpingography of combined pneumoper-toneum and uterotubal x-rays—one or all of these tests at one and the same session, (b) clinical evaluation in a series of interesting cases studied.

General Reconstructive Surgery

Morton L Berson, M D New York

Photographs moulages, drawings, and stereoptican slides presenting new surgical procedures for (1) building up breasts and filling in depressions in facial contour by the use of derma-fat-fascia translants, (2) rebuilding old depressed fractures of the frontal, maxillary malar and nasal bones by the use of autogenous cartulage grafts, (3) correcting extensive sear contractures by the use of split skin grafts (4) complete construction of auricle (5) repositioning protruding ears by construction of an antibelix (6) reconstructing various hand deformities (7) constructing a pseudoarcola (motion pletures)

STUDIES IN VIBRATORY SENSE
CLINICAL SIGNIFICANCE OF QUANTITATIVE ESTIMATIONS

W S Collens, M D
A M Rabiner, M D
L C Boas, M D
J D Zilinsky, M D
N D Wilensky, M D
J J Greenwald, M D
Israel-Zion Hospital
Brooklyn

Quantitative studies of vibratory sense have been made with an electrically driven tuning fork in which the amplitude of vibration of the fork could be controlled and varied by means of a rheostat. It was found that the intensity of impairment to vibratory sense could serve as an index for evaluating intensity of neuropathic states. Another significant observation consisted in the recognition of subclinical forms of neuropathy by the detection of impaired vibratory sense. This method additionally serves as a valuable guide to therapy. The exhibit will consist of a presentation of the anatomy of the pathway carrying vibratory sense, the physiology of this pathway, graphic presentations of normal controls, and a graphic presentation of quantitative studies of the neuropathies both before and after the institution of treatment with various fractions of the vitamin B complex group

THE MANAGEMENT OF STASIS ULCERS

Israel A. Brunstein, M D Stuyvesant Polyclinic New York

The exhibit will consist of text and photographic illustrations. A short outline of the etiology and classification of stasis ulcers will be given. Illustrations will be of before- and after-treatment, with legends on technical procedures. Medications employed in the treatment of these conditions will be presented.

Erosive Bone Lesions and Soft Tissues (Ossifications) Associated with Spinal Cord Injuries (Paraplegia)

> Norman Heilbrun, M D Buffalo

William G Kuhn, Jr, M D A B Soule, M D Burlington, Vermont

The exhibit shows the extensive erosions that occur in the bones associated with the decubitus sores of the trochanters, and the ossifications which occur in the soft tissues. Short case histories accompany some of the radiographs, as well as photographs, black and white, and colored, of the extensive decubitus sores. Biopsy material of the characteristic erosive bone lesions is given

PRIMARY FIBEOSITIS (DUPUYTREN'S CONTRACTURE)

Charles LeRoy Steinberg, M.D Rochester General Hospital Rochester

The exhibit describes the pathology, symptomatology, biochemical blood changes, and treatment with tocopherols of primary fibrositis Primary fibrositis is overdiagnosed in Great Britain and on the Continent It is underdiagnosed in the Western Hemisphere Dupuytren's contracture is a form of primary fibrositis which is common but is

not often diagnosed because it is not thought of in routine physical examinations. It may be the one objective evidence leading to a diagnosis of primary fibrositis

OPERATIVE PROCEDURES FOR HYPOSPADIAS

Forrest Young, M D
John A. Benjamin, M D
Warren E George, M D
University of Rochester
School of Medicine and Dentistry
Rochester

Drawings and photographs of preoperative appearance, technic of operative correction of hypospadias, and postoperative results

REHABILITATION OF PATIENTS WITH SPINAL CORD DISORDERS

> George G Deaver, M D Institute for Crippled and Disabled New York

Film with sound, showing 14 cases and methods used in physical rehabilitation. Motion picture only

DIFFICULTIES IN THE DIAGNOSIS AND TREATMENT OF LESIONS OF THE PYLORIC ANTRUM

Harry L Segal, M D
James S Watson, Jr, M D
Theodore B Steinhausen, M D

University of Rochester, School of Medicine and Dentistry Rochester

The exhibit demonstrates lesions found in the pyloric antrum of the stomach which present difficulties in the differentiation between beingn and malignant lesions. The differential diagnosis will be discussed. Prints of x-ray films, gastroscopic findings, etc., will be presented.

ABDOMINAL WALL NEURALGIA

Abe I. Rock, M.D
University of Buffalo, School of Medicine
Buffalo
Bernard Judovich, M D
Philadelphia, Pennsylvania

Abdominal wall neuralgia of the segmental type Segmental neuralgia may simulate the pain of abdominal visceral disease and is often the explanation for negative surgical exploration, especially multiple operations with negative findings. Tender and painful zones of the lower quadrants which are typical of neuralgia due to dorsolumbar strain. Therapeutic nerve block as an efficacious method of treatment. Etiology, diagnosis, treatment, case histories, manikins (motion pictures)

TECHNIC OF RADICAL NECK DISSECTION AND OF TOTAL LARYNGECTOMY

> Hayes Martin, M D Memorial Hospital New York

Reproductions of drawings of the various steps of the surgical technic of these two operations. With each drawing there is an appended legend describing the procedure. Color slides of larynges removed by total laryngectomy show the primary cancers.

EARLY MINIMAL BRONCHIECTASIS

John R. Myers, M D Syracuse

The exhibit stresses the diagnosis of early and minimal bronchiectasis before the usual classic signs and symptoms have developed. Bronchograms of cases representing various stages of advancement, case histories, physical findings, laboratory findings, and bronchoscopic pictures. The need for further study as to the best therapy and prognosis of these early recognized cases will be stressed

CASE OF LOSFFLER & SYNDROMS

Victor F Woolf, M.D. Lenox Hill Hospital New York

A 44-year-old white woman with a history of asthmatic attacks since 1939 was found to have an extensive bilateral pulmonary lesion on x ray in September 1945. This was thought to be tubercu lous and the patient was hospitalized. On admission the same diagnosis was mado. Sputum was negative and physical signs negligible. An x ray taken in December, 1945 showed complete clearing of the lesions and cardiac enlargement. The lungs have remained clear on subsequent x ray examinations. Blood counts in September, 1945 and March, 1946 showed cosinophilia of 14 per cent and 7 per cent, respectively. The case was diagnosed as a transitory inflitrate associated with cosinophilia—Loef iter's syndrome. The problems of differential diagnosis, pathogeness and prognosis as well as relation to other diseases with allergic manifestations, are of considerable interest.

THE EYE AND VICAMIN DEFICIENCIES

New York State Department of Social Welfare Commission for the Blind New York

Illustrations representing the eye and vitamin deficiencies. A recently prepared article on the subject is available for distribution.

CLINICAL MANIFESTATIONS OF ALLERGY

H. Harold Gelfand, M.D Gouverneur Hospital New York

Motion picture, silent, full color Diagnosis and treatment of all clinical states of allergy technic is skin testing, therapeutic procedure showing dosage and modes to follow in treatment, botany of hay fover Motion picture only

INTRAVENOUS PROCAINE A METHOD FOR CONTROLLED ADMINISTRATION WITH BLOOD LEVEL

David J Graubard, M.D Raphael W Robertazzi, M.D Milton C. Peterson, M.D

New York Post-Graduate Hospital and Medical School New York

A meter for controlling intravenous procaine infusions. This meter is interposed between the source of fluid administration and the recipions. Blood level studies of procaine following intravenous injection in the rabbit. VOCATIONAL REHABILITATION

New York State Division of Vocational Rehabilitation New York

Pamphlets describing the services of physical restoration and vocational preparation (motion pleture)

CONTROL OF EPIDEMIC RINGWORM OF THE SCALP

Louis Schwartz, M.D Samuel M Peck, M.D Isadore Botvinick, M.D Armond L. Leibovitz, M.D United States Public Health Service Bethesda, Maryland

The exhibit shows charts of the incidence of ring worm of the scalp in the United States and in the schools of Higgerstown, Maryland Charts describe the methods used for controlling epidemics, including santation of barber shops, setting up treatment clinics in the schools, method of identifying cases by means of the Wood's light method of sterilising electric clippers and other barber's instruments, ovaluation of various topical applications for treatment, and cultures of Microsporon audouino Photographs of actual cases.

ARTICLES MADE IN SHOPS OF MEDICAL REHABILITA

United States Veterans Hospital Veterans Administration Canandalgua

Display of plastic, leather weaving, woodwork and printing. Charts of organization and operation.

CARCINOMA OF THE UTERINE CERVIX AND THE PROGNOSTIC SIGNIFICANCE OF POSTRADIATION FI

Clyde L. Randell, M.D Donald M. Hall, M.D Buffalo General Hospital Buffalo

Following the treatment of cervical carcinoma by radium and roentgen therapy personic follow-up examinations reveal a varying degree of vagina contraction and parametrial thickening. Factors known to influence the degree of fibrodis are evaluated in order to determine if the extent of fibrodis is, in itself of prognostic agnificance. Climcal findings illustrated by photographs and roentgen films. Statistical data presented by charts.

RADIOCURABILITY OF CANCER

Maurice Lens, M.D College of Physicians and Surgeons, Columbia University New York

The relationship between the cure of cancer its clinical characteristics, extent, location, microscopic structure, and tumor dosage are illustrated by charts and transparences based on experience at the Presbyternan Hospital, New York.

TRAUMA TO THE NECK AND CHEST INVOLVING THE MEDIASTINUM

Milton Sills Lloyd, M.D Emil A. Naclerio, M.D Staten Island Hospital Richmond Memoral Hospital Tompkinsville The exhibit consists of photographs from clinical records demonstrating that when the mediastinal spaces are infected the result is not necessarily fatal if immediate and adequate dramage is provided

RECONSTRUCTION OF THE EXTERNAL EAR

Herbert Conway, M D
New York Hospital
Robert H Clifford III, M D
Veterans Hospital
New York

Moulages and photographs illustrating the steps in reconstruction of the external ear for deformity following trauma, and for congenital absence of the car

Scleroderma Clinical and Pathologic Aspects

A Wilbur Duryee, M D
Irving Lemwand, M.D
York Post-Graduate Medical School and

New York Post-Graduate Medical School and Hospital New York

Photographs in color, and black and white of patients and their skin lesions Pathologic photographs of typical lesions X-rays (photographs) of visceral lesions Charts of laboratory findings Electrocardiograms Electro-encephalograms

EVOLUTION OF SURGERY OF PEPTIC ULCER

Alfred H Iason, M D Brooklyn

FACILITIES OFFERED PHYSICIANS
DIVISION OF LABORATORIES
Department of Health
Buffalo

Samples of the various outfits for collection of specimens destined for laboratory examination Also, some examples of blood smears showing recurrent Southwest Pacific strain of the vivax malarial parasites demonstrated in the returned veterans

THE DETERMINATION OF VITAMIN C DEFICIENCY IN INFECTIONS BY MEANS OF THE INTRADERMAL TEST

Lawrence B Slobody, M D
New York Medical College, Flower and Fifth
Avenue Hospitals
New York

Ninety cases of tuberculosis tested for vitamin C deficiency by means of intradermal test and blood plasma determination. Technic and value of intradermal test are explained. Two illustrations of the technic and test itself, respectively.

CANCER FACTS

Donald B Armstrong, M D George M Wheatley, M D Metropolitan Life Insurance Co New York

Exhibit consists of charts in color, arranged under three headings—facts behind the increasing mortality from cancer, current cancer facts, and recent progress in cancer control.

IMPORTANCE OF STUDIES OF BONE MARROW FROM ILIAC CREST

Michael A Rubinstein, M.D Montefiore Hospital New York

Bone marrow studies were performed simultane-

ously in iliac crest and sternal aspirations in 200 cases of various hematologic disorders and different instances of malignancy. A modified technic of iliac crest puncture is shown and its advantages indicated. Comparative value of iliac crest and sternal marrow studies in different affections is reviewed. Iliac crest aspiration has proved to be much more informative than the conventional sternal aspiration in early diagnosis of multiple myeloma and in detection of early metastatic lesions, neoplastic cells were recovered about ten times more frequently from iliac crest than from sternal aspiration.

THE ELECTRO-ENCEPHALOGRAM AND ITS VALUE TO YOU

Burton M Shinners, M D Children's Hospital Buffalo

The normal electro-encephalogram pattern will be shown in different age levels in children. Abnormal records found in epilepsy, birth injuries, and subdural hematomas will be demonstrated. Value of the record in the study of encephalitis in respect to future brain damage residual will be shown Convulsive activity in children not epileptic brought on by hyperpraxia will be differentiated from epilepsy. Appropriate charts, records and a technician will be at hand to demonstrate the machine

THE IMMOBILIZING LUNG CHAMBER IN THE TREAT-MENT OF PULMONARY TUBERCULOSIS

> Alvan L Barach, M D Robert K Myers, M D Bettma Garthwaite, M D

College of Physicians and Surgeons, Columbia University New York

Drawing and photographs with legends illustrating mechanism by which equal pressures are obtained on both sides of the chest wall during residence in equalizing chamber — X-ray films of treated patients illustrating clearing of infiltration and disappearance of cavity — A motion picture will accompany the exhibit and will further explain mechanism of immobilization of the lungs by this method and technic of treatment

EQUIPMENT AIDS FOR OCCUPATIONAL THERAPY

New York Hospital, Westchester Division White Plains

Specially designed equipment for those confined to bed, those with only one hand, and those with impaired eyesight or blind. Small bedstand supports typewriter for typist confined to bed. Bookholder, work-table, drawing board, looms, clamp and vacuum cup holder make many activities possible for handicapped. Special templets and technics for the blind. Books presenting original technics used for construction of special equipment aids. Models, half or full sized. Small-size stand, half-size typewriter, doll in bed typing. Templets used, special tools, and the eight steps of making fold-up metal work by special technic originally designed for the blind.

GOUTY ARTHRITIS

John H Talbott, M D
University of Buffalo, School of Medicine
Buffalo

Series of transparencies of patients with gout

Joint deformities and x ray pictures of same at various stages of involvement. Pertinent points in the diagnosis and treatment of gouty arthritis. Differential diagnosis of x ray findings.

HOW A TUMOR CLINIC WORKS New York State Tumor Clinic Association and Division of Cancer Control State Department of Health Albany

Complete modus operandi of a tumor clinic.

ORBITAL TUMORS Raymond G Ingalia, M.D Presbyterian Hospital New York

Data gathered from analysis of 200 tumors of the orbit studied at the Eye Institute. Details of 24 different types of orbital tumors will be illustrated by photographs of patient. Roentgenograms, excised tumors, and photomicrographs of tumor tissue

A MODIFICATION OF THE EXTRALARYNGEAL AP-PROACH TO ARYTENOIDECTOMY FOR BILATERAL ABDUCTOR PARALYSIS

DeGraaf Woodman, M D College of Physicians and Surgeons, Columbia University New York

Charts describing the operation step by step

CHEST X RAYS Division of Tuberculosis New York State Department of Health Albany

Large wheel turned by spectators to bring into view individual x-ray plates. Demonstration of different types of chest pathology to be found in mass surveys.

CEREBROSPINAL FLUIDS Application of Newer KNOWLEDGE TO MEDICAL PRACTICE

Division of Laboratories and Research New York State Department of Health Albany

Three panels with material for distribution, and laboratory test displays. Since the Sanitary Code has been amended to require the submission of specimens of cerebrospinal fluid in connection with neurosyphilis, the exhibit is in part, directed to informing the practitioner what the laboratory expects of him and what can be provided by the laboratory in the way of information about his case. Examples of characteristic findings in the examina tion of cerebrospinal fluids and their significance are presented. Display of an actual colloidal gold test.

MIGRANT LABORERS AND THEIR CHILDREN New York State Department of Health Albany

Illuminated panels containing photographs show ing conditions in migrant labor camps in New York State Work of State Health Department in cor recting unsatisfactory health conditions protecting the health of workers and their children.

> ALL IN A DAY Division of Public Health Nursing New York State Department of Health Albany

Panels showing photographic enlargement of the

public health nurse and activities in public health nursing.

KINETIC DISABILITIES OF THE HAND

Michael Burman, M.D. Hospital for Joint Diseases Now York

Kinetic disabilities of the hand are divided into four groupings spastle paralytic, arthritic and traumatic Each grouping is studied in relation to the intrinsic and extrinsic muscles of the hand Intrinsic muscles which arise and end in the hand aro the thenar muscles, the hypothenar muscles, adductor muscles, the lumbricals, and interessed muscles. Extrinsic muscles, which arise in the forcarm and end in the hand are the flexor and extensor muscles of wrist and fingers. Photographs and diagrams illustrate the various disabilities.

STUDIES IN CARDIOVASCULAR STRILLIS

Edwin P Maynard M D Brooklyn Hospital Brooklyn Claire Lings New York Heart Association, Inc. New York

Incidence and clinical importance Prevention by treatment with armenic and heavy metals

New criteria for the diagnosis of uncompli cated syphilitic aortitis

SELECTED STUDIES MADE AT THE NEW YORK MEDI CAL COLLEGE, METROPOLITAN HOSPITAL RESEARCH UNIT

> Thomas H McGavick, M.D. David Schwimmer, M.D. Isadore J Drekter, B.S Leo Gitman, M.D Seymour Schutzer M.D. New York

Metabolic studies in human volunteers on limited mtake of food and water

Tumors of the adrenal gland

Tumors of the agreenal guand
 The interrelationship of lymphocyte counts,
 blood sugar levels, and 17 ketosteroid exerction in
 human beings on a limited fluid and caloric intake.

THE USE OF FLUORESCEIN TO DETERMINE THE ADEQUACY OF THE CIRCULATION

Kurt Lange, M.D Linn J Boyd, M.D David Weiner, M.D New York Medical College Flower and Fifth Avenue Hospitals New York

The intravenous injection of fluorescem, which is nontoxic in doses suggested, leads to an intense illumination on the long-wave ultraviolet light wherever the flow of blood reaches the tisrues. Color thus obtained can be measured at any spot over the body as to its intensity by means of the dermofluorometer This gives objective informs tion about the amount of blood reaching an area and the circulation time to that area. Application of the method for objective determination of circu lation time to any part of the body will be shown In skin grafting, the method is helpful to deter mine the active vacularity of an area on to which akin is to be grafted.

The use of the method for the diagnosis of periph

eral vascular discases will be shown. In cases of

strangulated hernia the method permits, with certainty, the immediate determination of the viability of bowel. Since the amount of staining of the skin depends essentially upon the capillary permeability, provided that the amount of blood reaching the area is normal, conclusions can be drawn as to the capillary permeability in health and disease. In myvedema, the nephrotic stage of chronic glomerular nephritis, and in starvation edema, the capillary permeability is increased. Kodachromes, prints, charts, and graphs

VETERANS MEDICAL CARE PLAN

Frederick E Lane, M D U S Veterans Administration New York

Photographic illustration of operation of the medical care plan Statistical graphs showing number of cases treated, cost, number of physicians participating Comparison with medical care plans of other states (motion picture)

CARCINOMA OF THE PROSTATE, CERVIX, ESOPHAGUS, AND STOMACH

Louis C Kress, M D
Hans Sauer, M D
James P Palmer, M D
Joseph P O'Brien, M.D
Joseph E McManus, M.D
Roswell Park Memorial Institute
Buffalo

Transparencies illustrating diagnosis of various forms of treatment, classification, and end results of cancer of the prostate, cervix, esophagus, and stomach.

CERVICAL SPINE AND SHOULDER STUDIES

Lee A Hadley, M D Lucy F Squire, M D Syracuse

Atlanto-occipital fusion, occipital vertebra, ossiculum terminale, basilar impression, and other abnormalities about the foramen magnum associated with neurologic symptoms. Congenital absence of the cervical pedicle. Study of restricted movement of shoulder joint.

THE DIAGNOSIS OF MALIGNANCY FROM HISTOLOGIC SECTIONS OF PLEURAL AND ABDOMINAL FLUIDS, SPUTUM, AND URINE

Siegfried Tannhauser, M D
Deaconess Hospital
Buffalo

Technic of processing pleural and abdominal fluids, sputa, and urine for histologic sections is described and exemplified by photographs. Photographs of histologic sections containing malignant tumor cells, together with short clinical histories, x-rays, and autopsy findings if available. Photographs of sections of these fluids, etc., in various noncancerous conditions

New York State Medical Library State Department of Education Albany

A representative will be present to answer questions concerning the services of the Library Members of the Medical Society are urged to use their library in the Education Building, Albany There are over 54,000 volumes in the collection, and over

500 journals are received currently Books are sent to the borrower, or selected material on a special subject will be sent, if requested This service is extended without charge to physicians, dentists, and nurses registered in New York State The only obligation imposed on the borrower is the prompt return of the books and the payment of return transportation charges

Intrathoracic Neoplasms

William L Watson, M D Herbert C Maier, M D John L Pool, M.D Memorial Hospital New York

The exhibit consists of a series of representative cases of pulmonary, mediastinal, pleural, and esophageal neoplasms, both benign and malignant, represented by photographs of x-rays, and gross and microscopic specimens. There is a brief summary of each patient stressing the important diagnostic points

Systemic Changes in Patients with Gastric Cancer

Sloan-Kettering Institute, Memorial Hospital New York

Results of work obtained in metabolic studies on patients with gastric cancer over a period of years. These indicate existence of systemic disturbances involving phases of metabolism dependent upon the adrenal cortex, the liver, and possibly other organs. Syndrome thus defined is described, working hypothesis is illustrated.

THORACOLUMBAR SYMPATHECTOMY OF HYPERTENSIVE CARDIOVASCULAR DISEASE

J W Hinton, M D
C A. Poindexter, M D
J W Lord, M D
W Welch, M D
S A. Localio, M D

New York Post-Graduate Medical School and Hospital New York

Consideration of anatomy and physiology of the sympathetic nervous system Selection of patients for operation Illustrations of the operative technic, of typical end results Statistical survey of 400 cases

Hemostabis with Oxidized Cellulose (Absorb-Able Gauze and Cotton) Virginia Kneeland Frantz, M D Presbyterian Hospital New York

Motion picture showing a few simple chemical tests of ordized cellulose in the form of surgical gauze—solubility, and combination with hemoglobin and whole blood—Technic of testing absorbable material in subcutaneous tissue of rats is shown, followed by operative procedures in dogs, in which bleeding is controlled by the hemostatic sponge Autopsy of dog, four and one-half weeks postoperative—Four clinical surgical procedures follow—two clean closed cases, a drained contaminated case, and an infected wound

VISUAL AIDS IN PLASTIC SURGERY Rosaria R. Bender, M D Buffalo

Plastic molds, mostly facial, as a means for recording and diagnosing

ANGLEPELVINETRY (ANGLE PELVINETRY)

Gemma Barzilei M D New York

A survey of pelvic capacity based on a graphic demonstration of the relationship of the size and shape of the three main planes of the different types of obstetric pelves to size and shape of the planes of the baby's head

Material obtained from Smithsonian Institute

Washington DC

PRYCHOLOGIC TESTING MATERIAL

Leslie Osborne, M.D Louise Kraft Myers, M.D Memorial Hospital and University of Buffalo Medical School Buffalo

Psychologic tests Stanford Binet general in telligence test Rorschach personality diagnosis thematic apperception test, mental deterioration tests, vocational preference tests educational achievement measures.

COUNCIL COMMITTEE ON PUBLIC HEALTH AND EDUCATION

O W H MITCHELL, M D Chairman

Medical Society of the State of New York

Aiding the county medical societies to arrange their programs throughout the year is one of the many activities of this Committee which is shown in graphic form in this exhibit

THE WOMAN'S AUXILIARY

Medical Society of the State of New York

This exhibit depicts the activities of the Woman s Auxiliary Map and charts show its growth and development

FRIENDS OF MEDICAL RESEARCH Medical Society of the State of New York

'Really Man's Best Friend," presents pictorially man's progress in medical research with the aid of the doz

The Medical Society of the State of New York, working with Friends of Medical Research, doveloped this exhibit as an aid to the dissemination of facts about research work with animals Really Man's Best Friend was first shown at the American Museum of Natural History where the Whipple Prize Dogs received their award in recognition for Outstanding Services to Illumanity

How the Society Serves the Physician Medical Society of the State of New York

Today more than ever, the Society serves and can serve the physicians. This is important to every member This exhibit presents graphically the services of the various departments.

THE DIRECTORY
Medical Society of the State of New York

Here is an opportunity for you to see just exactly what the Directory Blue Book contains. The new edition is the largest and best indexed Directory the Society has ever published. Changes for the 1948 Edition can be left at this exhibit

BUREAU OF MEDICAL CARE INSURANCE Medical Society of the State of New York

This exhibit of voluntary nonprofit medical care plans approved by the medical profession illustrates the growth of the plans and the benefits to both you, as a physician, and to your patient-subscriber

and the same

....

THE TECHNICAL EXHIBITS

NEW AIDS TO THE PRACTICE OF MEDICINE

Surgical Instruments
Medical Books
Pharmaceutical
Specialties
X-Ray Equipment
Other Products and
Services

THE technical exhibitors are keeping pace with the advances in medical science, thus, you will be able to apply promptly, for the benefit of your patients, many of the developments found in the exhibits

Specific, well-referenced literature will be available at almost every exhibit, giving up-tothe-minute clinical background supporting the application of these pharmaceutical products to your medical practice

The following pages contain brief descriptions of "what's new" with each exhibitor

Abbott Laboratories, North Chicago (Booth 75) cordially invites you to visit the entirely new exhibit professional service staff present will welcome an opportunity to discuss the newer developments in antibiotic anticonvulsant, anesthetic allergence sulfonamide, bematinic, vitamin, and other fields

The Alkaloi Company, Taunton Massachusetts (Booth 71) Alkaloi—an alkaline saline solution carefully balanced for the treatment of all nuceous nombranes and irritated tissues Nontoxic—non-rintating—effective Irrigol—an aseptic slightly artringent powder which makes a valuable solution for vaginal douching, colonic irrigations, and rectal chemas.

American Resuscitation Co., West Hompstead, New York (Booth 6) will demonstrate the Emerson iron lung resuscitator and hot pack apparatus Anthony S Valente, Eastern representative, 65 Hempstead Turnpike, West Hempstead New York

Ames Company Inc. Elk hart, Indiana (Booth 50) will demonstrate technics for the detection of urino-sugar It is a copper reduction test which devalops its own heat within the test tube. Albut test (Albumintest) is a reliable, nonpoisonous, non-corresive tablet method for the detection of protein (albumin). It does not require heat. Hematest is a new unique tablet method for the detection of occult blood in

feces, urine and other body fluids. It is a reliable procedure that can be carried out quickly by the physician, public health worker or laboratory technician. Amos representatives will be glad to discuss the therapeutic indications of the Ames bile acid products, Decholin Degalol and Cholmodin with attending physicians.

The Arlington Chemical Company, Yonkers, New York (Booth 63) will exhibit their complete line of allergenic extracts for diagnosis and treatment. There will also be a complete line of our diagnostic sets covering pollens fungi, food incidental and epidermal allergens. To demonstrate its palatability samples will be served of our protein hydrolysate product Aminoids

The Armour Laboratories, Chicago (Booths 83 and 84), cordually invites members of the Medical Society of the State of New York to vasit the Armour display Mr R. H Andrew, of Chicago will be in charge, and Messrs N F Bell and W T Brasil will be in attendance.

Ayerst, McKenna & Harrison Ltd. New York (Booth 29) Fremann 18 a potent preparation of naturally occurring water-soluble equine conjugated extrogens containing sodium estrone sulfate as one of its estrogens. Fremann combines a high degree of potency with convenience of administration and is well tolerated by the patient. It is supplied with the approval of the Research Institute of Endocrinology McGill University, and is accepted by the Council of Pharmacy and Chemistry of the American Medical Association

The Best Foods, Inc. New York (Booth 8), is ex

hibiting Nucoa, the wholesome nutritious vegetable margarine, which contains 15,000 units of visit min A to the pound also on exhibit will be the famous Best Foods—Hellmann s Real Mayonnaise and other Best Foods products. Muss Elsie Stark director of Consumer Education, will be in charge of the booth and will welcome questions about the products

Bilhuber Knoll Corp., Orange, New Jorsey (Booth 51) For the latest on the fine modernal chemicals of the Bilhuber Knoll Corp visit their booth. The display includes the new vasopressor, Conethyl, antispasmodic Octin sedative and mild hypnotic Bromarnd, analgesic and cough sedative, Dilaudid analeptic and antianovant, Metrazol, and myocar dial stimulant and diuretic, Thocaclin, as well as other dependable prescription chemicals. They are prescribed alone or in combination to meet the individual patient sroquirement.

Ernst Bischoff Company, Inc., Ivoryton, Connecticut (Booth 58) cordially invites you to visit them display Professional service representatives Mr Lawrence Lesser and Mr Julian L. Stratton will be on hand and will welcome your questions concerning the use of Bischoff products in your practice

The Borden Company, New York (Booth 39), invites your attention to Gorlac, a vitamin-fortified powdered milk for well rounded nutrition in convalescence pre- and postoporative duets, gernatrics, pregnancy and lactation, and soft and liquid diets Likewise exhibited will be our long established products for infant feedly. But a Dalla P.

for infant feeding Biolac, Dryco
Yull-Soy Merrell-Soule Special Milks, general purpose Klim and Beta Lactose Spend a few pleasant
moments at Borden a Booth

Brewer & Company, Inc., Vorcester Massachusetts (Booth 14) This exhibit consists of specialties, centering around Thesodate the original enterie-ceated tablet of theobromine sodium acctate, and Lunamin a combination of theophylline sodium acctate, phenobarbital and ephedinne for the treatment of asthma. Also Brewer Capsules and Ampuls, other specialties and standard pharmaceuticals manufactured by Brewer & Company Inc., including a complete line of vitamin prevention for

of vitamin preparations for internal use and injection Gel-ots, the newest mode in oral vitamin therapy, are also featured

Bristol Laboratories, Inc., New York (Booth 95)
This exhibit will be devoted to the display of anti
bottes and pharmaceutical products Qualified
representatives will be on hand to assat the medical
profession with any inquiries. Laterature describing Bristol products will be available

Burroughs Wellcome & Co., New York (Booth 73) cordially invite phymicians to their exhibit of a representative group of fine pharmaceuticals and chemlcals. Of particular interest are Nutragest, the palatable dietary compound containing the amino acids, important minerals, vitamins, and carbohydrates, Digovin, a pure, stable, crystalline glycoside of digitalis lanata, combining uniform potency with rapidity of action, Wellcome Benzyl Benzoate Emulsion, the twenty-four-hour treatment for scabies and pediculosis capita, and Lubafax brand surgical lubricant

Cambridge Instrument Company, Inc., New York (Booth 104), will exhibit diagnostic instruments Among these will be the well-known Cambridge Simph-Trol portable model electrocardiograph and electrocardiograph-stethograph with pulse recorder, the new Cambridge electrokymograph for recording heart border motion, and the Cambridge plethysmograph—a new calibrated instrument which makes quantitative and reproducible records

Camel Cigarettes, New York (Booths 4 and 5), will present a dramatic full color review of their recent medical research on smoking, as well as the details of the nation-wide survey showing that "More Doctors Smoke Camels Than Any Other Cigarette" Another panel will illustrate the absorption of nicotine in the respiratory tract Representatives will be present

Cameron Heartometer Company, Chicago (Booth 30) See the improved Heartometer, a scientific precision instrument for accurately recording systolic and diastolic blood pressures, also furnishing a permanent graphic record of the pulse rate, disturbances of the rhythm, myocardial response, the action of the valves, as well as peripheral vascular circulation. The Heartometer clearly reveals heart disturbances in both early and advanced stages, and is of great value in checking the progress of medication and treatments.

Canadian Radium & Uranium Corp, New York (Booth 11) High-purity radium is available to the medical profession in any form and any type of container A special exhibit is devoted to alpha-ray therapy by the utilization of Radon in ointment For further interesting details, call at Booth 11

Carnation Company, Oconomowoc, Wisconsin (Booth 28), cordially invites you to visit their exhibit where you will see an attractive display presenting some interesting information on the various uses of Carnation Vitamin D Evaporated Milk for infant feeding, child feeding, and general diet purposes. The method by which Carnation Milk is generously fortified with vitamin D—400 USP units per reconstituted quart—will be explained Valuable literature will also be available for distribution

Ciba Pharmaceutical Products, Inc, Summit, New Jersey (Booths 81 and 82), invite you to visit their exhibit for latest information on Pyribenzamine the new antihistaminic compound, Privine HCl, an effective long-lasting nasal vasoconstrictor, and Metandren Linguets, the most potent orally active androgenic hormone available in a suitable form for sublingual absorption. Representatives in attendance will be glad to answer any questions you may have about these and other Ciba products.

The Coca-Cola Company, Atlanta, Georgia (Booth 109) Coca-Cola will be served through the joint courtesy of The Buffalo Coca-Cola Bottling Corporation and The Coca-Cola Company

Davies, Rose & Co, Ltd., Boston, Massachusetts (Booth 103) At this meeting our representatives, R J Mansfield and H V Orne, will be ready to explain to physicians, visiting our booth, the current quindine sulfate situation Quindine has been a very perplexing problem during the past few years Our tablets of quindine sulfate are alkaloidally standardized, giving the physician assurance of uniformity in dosage

The Denver Chemical Mfg Co, Inc., New York (Booth 13) Galatest, for the instantaneous determination of urine sugar and Acetone Test (Denco) for the detection of acetone in urine will be exhibited You are cordially invited to visit our booth for demonstration of these "spot tests" for sugar and acetone Galatest and Acetone Test (Denco) offer advantages of accuracy, simplicity, and economy in routine urinalysis

The Doho Chemical Corp, New York (Booth 79) The makers of Auralgan are introducing at this meeting, their new sulfa drug preparation O-TOS-MO-SAN, indicated in the treatment and control of chronic suppuration of the ears. Our representatives will be happy to explain, in detail, the workings of these medications, also to distribute our latest series of three Anatomico-Pathologic Charts of the ear, in color, suitable for framing

The Drug Products Co, Inc, Passaic, New Jersey (Booth 16) Naotin—an effective aid in the treatment of idiopathic headaches, migraine, and certain cephalalgias, and Aminoprod—a potent, palatable protein hydrolysate will feature our exhibit, as well as other therapeutic agents of special interest to physicians. You are cordially invited to attend and our representatives will be pleased to give you samples and full information.

Eaton Laboratories, Inc., New York (Booth 116), will exhibit several pharmaceutical preparations of interest to the physician. Furacin Soluble Dressing containing a new chemotherapeutic agent, Furacin (brand of introfurazone), will be exhibited This compound is a new antibacterial agent for the treatment of wound and surface infections. Clinical evaluation throughout the past two and one-half years indicates a wide field of use. Our representatives will be pleased to discuss Furacin Soluble Dressing with all physicians. Literature and samples will be available at the Eaton Laboratories, Inc., Exhibit

C B Fleet Co, Inc., Lynchburg, Virginia (Booth 26) A special saline laxative, Phospho-Soda (Fleet) combines sodium biphosphate and alkaline sodium phosphate in stable solution, which gives it the desirable buffer effect of these two phosphates in addition to its efficacy as an eliminant Phosphosoda (Fleet) is distinguished by extremely prompt and thorough but gentle action in elimination—when administered either as a purge or as a mild laxative during illness or convalescence

General Electric X-Ray Corporation, Buffalo and Rochester, New York (Booth 23) Factual discussions with members of our Buffalo and Rochester Sales and Service Organization during the State meeting will aid you in your future apparatus planning. If you are thinking about new and improved x-ray or electromedical apparatus, our layout engineers can help you with detailed plans and specifications. Stop in and avail yourself of our wide experience and know-how

Pil. Digitalis (Davies, Rose)

01 Gram $(1\frac{1}{2})$ grains)

Physiologically Standardized

Each pill contains 0.1 Gm ($1\frac{1}{2}$ grs) Powdered Digitalis, produced from carefully selected leaf of Digitalis purpurea, therefore of an activity equivalent to 1 U S P XII Digitalis Unit

When Pil Digitalis (Davies, Rose) are dispensed on a prescription, the physician is assured that the patient receives digitalis in its completeness and obtains the full benefit of the therapy

Trial package and literature sent to physicians on request.

Davies, Rose & Company, Limited

Manufacturing Chemists,

Boston 18, Massachusetts

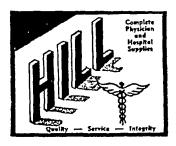

[Continued from page 776]

The General Hospital Supply Corp, New York (Booth 18) Complete hospital equipment including oxygen tents, plastic infant oxygen hoods, plastic oxygen domes, plastic bassinets, nursery equipment, lights, resuscitators, hospital beds, incubators, and penicillin aerosol equipment

Otis E Glidden & Co, Evanston, Illinois (Booth 61) ZymenoL, a palatable emulsion containing Brewer's Yeast, provides a natural approach to effective bowel management, without irritant, habit-forming drugs, or artificial bulkage Teaspoonful dosage provides minimum liquid petrolatum intake, avoids leakage, and assures negligible interference with fat soluble vitamin absorption Literature and free trial supply on request

The Harrower Laboratory, Inc, Glendale, Calif (Booth 10), will feature Endothyrin, Harrower's major advance in thyroid therapy, and demonstrate the exclusive Harrower process of removing deleterious material in the reduction of the thyroid gland. The purity of Harrower's 15 to 1 concentrated thyroid extract is illustrated by x-ray defraction studies, and the dosage range is shown

H J Heinz Company, Pittsburgh, Pennsylvania (Booth 57), cordially invites you to visit its booth where you will see an attractive display presenting interesting information on the uses of Heinz Strained and Junior Foods. The twelfth edition of the popular Nutritional Chart is available upon request. While you visit our exhibit, register for it

Hill Surgical Supply Co, Syracuse, New York (Booth 92) Hill, exclusive distributor in Upstate New York of the Edin Cardiograph invites you to stop in for a demonstration of this distinguished machine—the only direct ink-writing

cardiograph on the market Hill will also display new and improved income-making equipment as well as a complete line of medication and supplies

Hoffmann-La Roche, Inc., Nutley, New Jersey (Booth 67) You are cordially invited to attend the Roche exhibit at the New York State Medical Convention It will be well worth your while to drop in and glance briefly at the interesting exhibit on such clinically valuable drugs as Prostigmin, the versatile cholinergic stimulant, Ephynal Acetate, the stable, pure, well-tolerated vitamin E compound, Per-Os-Cillin, the dependable oral penicillin tablet, Syntropan, the non-narcotic well-tolerated antispasmodic, Syntrogel, the pleasant tasting, rapid acting, efficient antacid, and other products you may find of value in your practice. A staff of experienced Roche representatives will be present to answer your questions and assist you in any possible way.

Holland-Rantos Company, Inc., New York (Booth 31) You are cordially invited to visit the Holland-Rantos Booth where on display will be the nationally known and universally used Koromex contraceptive specialties Besides the new Koromex Set Complete, which is a package combining the necessary items for complete contraceptive technic, there will be the new

Nylmerate Jelly, introduced only a short time ago and received enthusiastically for the treatment of trichomoniasis and vaginal discharges of a non-specific origin. Representatives of the company will be on hand to answer all questions. Samples of Nylmerate Jelly and Koromex Jelly will be available, as will be copies of the new physician's patient instruction chart.

Hygeia Nursing Bottle Co, Inc., Buffalo, New York (Booth 32), cordially invites you to visit their booth to see the advantage of the new, improved Hygeia Nursing Bottle Unit—Learn why prescribing the Hygeia Unit—including bottle, nipple, and cap—will help mothers overcome feeding problems—Mr M C Decker will be in attendance

Hynson, Westcott & Dunning, Inc., Baltimore, Maryland (Booth 76), will have an exhibit featuring Mercurochrome, Thantis Lozenges, and various pharmaceutical specialties of their manufacture. There will also be a display of diagnostic apparatus and ampule solutions which have been worked out in their laboratories in cooperation with physicians. Competent representatives will be in attendance to demonstrate and to provide information regarding these products. Literature will be available to physicians who are not already familiar with products exhibited.

Interchemical Corporation, Union, New Jersey (Booth 56) The Biochemical Division of the Interchemical Corporation presents Lyophilized Amino Acids—I C, a novel preparation for intravenous administration This product provides generous amounts of all the essential amino acids, being "freeze-dried," it offers a notable advantage in becoming "stat fresh" for venoclysis on restoration to solution Literature is available

Jeffrey-Fell Company, Buffalo, New York (Booth 17) Visitors to our display booth will find featured only the finest physicians' furniture and equipment of known and accepted manufacture While in Buffalo you are invited to visit our store at 1700 Main Street where you will find the most complete stock and display of physicians' supplies in the east

"Junket" Brand Foods, Division of Chr Hansen's Laboratory, Inc., Little Falls, New York (Booth 15) Enlarged photos illustrate the action of the rennet enzyme in forming softer, finer, milk curds. Free literature describes dietary uses of renne-custards in infant, child, convalescent, or postoperative feeding. Attendants on duty Complimentary package of "Junket" Rennet Powder and "Junket" Rennet Tablets presented to physicians who register

The Kelley-Koett Manufacturing Co, Covington, Kentucky (Booth 117) The American Electric Mobile Unit being displayed is an ideal unit for radiography and fluoroscopy in the office, clinic, or hospital It requires very little space, is inexpensive, and contains a unique powerhead offering an entirely new concept in x-ray service It incorporates a replaceable cartridge eliminating the need for a serviceman

Kellogg Company, Battle Creek, Michigan (Booth 87) Kellogg's cereals have an important place in restricted and normal diets because they contain valuable nutrients found in whole grains All-Bran is one of the best sources of iron, Corn Flakes and Rice Krispies are indicated in bland and wheat al-

ARTHRITIS and RHEUMATISM

Ray Formosil for intramuscular injection is a clinically proved, effective treatment in most cases of Arthritis and Rheumatism. It is a non toxic and sterile, buffered solution containing in each cc. the equivalent of

Formic Acid 5 mg Hydrated Silicic Acid 2.25 mg

A descriptive folder will be furnished upon request.

[Continued from page 778]

lergy diets Diet Manuals and Special Diet Slips are available

Kidde Manufacturing Co, Inc, Bloomfield, New Jersey (Booth 1) In this booth for the first time, the Kidde engineered Utero Tubal Insufflator Completely safe—insures correct volume and pressure at tolerable limits Simple operation—one valve, one gage—requires only small cartridge of carbon dioxide gas Provides diagnostic and therapeutic use of carbon dioxide gas or opaque oil as well as permanent record of tests. Also on display, the Kidde Dry Ice Apparatus used in treatment of superficial skin lesions. This apparatus is becoming increasingly popular because of its simplicity and superior cosmetic results obtained

H W Kinney and Sons, Inc., Columbus, Indiana (Booth 52) Physicians of the Medical Society of the State of New York are cordially invited to visit the Kinney exhibit Cartose and Kinney's Yeast preparations will be featured Messrs V P Medvedeff, Robert L Jarvis, and Wm J Mann will be in attendance

Lakeside Laboratories, Inc, Milwaukee, Wisconsin (Booths 90 and 91), will feature Mercuhydrin, well-tolerated mercurial diuretic, Estrogens, Lakeside, and Emulgen, emulsifying vehicle for penicillin Representatives will be on hand to describe the applications of these medications

Lanteen Medical Laboratories, Inc., Chicago, Illinois (Booth 2), cordially invite you to their exhibit of their well-known pharmaceutical specialties—Included will be natural and synthetic estrogenic products, Estrogel and Hexypheen Vi-Teens products, including Vi-Teens Homogenized Vitamins, as well as their line of gynecic specialties, will also be included

Lea and Febiger, Philadelphia, Pennsylvania (Booth 24), will exhibit among their new works and new editions, Joslin's Treatment of Diabetes Mellitus, Cushny's Pharmacology and Therapeutics, Scott and Van Wyck's Obstetrics & Gynecology, Wintrobe's Hematology, Haden's Hematology, Davis' Principles of Neurological Surgery, Davidoff and Dyke's Normal Encephalogram, Wesson's Urologic Roenigenology, Bell's Renal Discuses, Levinson and MacFate's Clinical Laboratory Diagnosis, and other standard works

Lederle Laboratories Division, American Cyanamid Company, New York (Booth 41), will have on display the new folic acid products about which there has been so much interest. Among the products to be shown will be Folvite, Lederle's brand of folic acid, Folvron, folic acid and iron, by which both iron-deficiency anemias and macrocytic anemias may be treated. Ledinac, the first protein hydrolysate to be derived from liver, will also be on display

Libby, McNeill & Libby, Chicago, Illinois (Booth 99) Libby's Vitamin Di Fortified Homogenized Evaporated Milk and Libby's Strained and Homogenized Baby Foods are featured at the Libby booth Physicians are invited to stop and discuss new findings on the greater availability of iron and ease of digestion of Libby's A.M A Council Accepted Foods for babies

Eli Lilly And Company, Indianapolis, Indiana (Booth 100), this year features an interesting presentation on the heart and a discussion on cardiac drugs Many Lilly products are to be on display, repre-

sentative literature will be available. The attending Lilly medical service representatives will be pleased to assist visiting physicians whenever possible

J B Lippincott Company, Philadelphia, Pennsylvania (Booth 115) presents a complete line of Lippincott selected professional books and journals. Be sure to see the current issue of the American Practitioner, the monthly medical journal designed to shorten the lag between experiment and practice. Titles of new books and new editions include. Dermatology and Syphilology, Signs and Symptoms—Their Clinical Interpretations, Diagnosis in Daily Practice, Diabetic Care in Pictures, Cardiovascular Diseases, Color Atlas of Hematology, Applied Anatomy of the Head and Neck, Essentials of Endocrinology, Diseases of the Nose and Throat, and Uterine Contractility in Pregnancy

McNeil Laboratories, Inc., Philadelphia, Pennsylvania (Booth 72) As the result of an interesting chnical study, the McNeil booth will present in full color, a series of kodachrome transparencies graphically portraying clinical signs of iron deficiency and secondary anemias. You are cordially invited to visit us. The booth is in charge of Mr. H. M. Schabacker, assisted by Mr. L. W. Rasmussen and Mr. J. R. Nevin

M & R Dietetic Labs, Inc., Columbus, Ohio (Booth 66), will display Similac, a food for infants deprived either partially or entirely of breast milk Messrs K. D Van Fossen and H O Davis will appreciate the opportunity to discuss the ment and suggested application for both the normal and special feeding cases

Mallon Chemical Corp, New York (Booth 80), will exhibit their new product Rectalgan, which has for its therapeutic purpose the control of pain and itching in hemorrhoids and pruntis. This is not a suppository or an ointment. Its well-chosen, effective ingredients are incorporated in a special scientifically processed liquid vehicle. There is no waiting time for the vehicle to dissolve or melt. Rectalgan can be applied to the affected area simply and easily. There is no necessity for the fingers or hands to touch the medication or the site of treatment. Anatomicals also will be shown. Samples and literature will be available to physicians attending.

The Maltex Company, Burlington, Vermont (Booth 70) Maltex Cereal, made in Vermont for the past fifty years, is in this booth You are invited to stop in for your 1947 calendar note book, a height-weight wall chart, a really good reducing diet, or just to register for a complimentary full-size package

The Maltine Company, New York (Booth 54), is exhibiting Mucigel, the latest development of the Maltine Company's Research Laboratories—Tedral, Proloid, and Depancol, which have gained wide acceptance, will be shown, as well as such fine products as Maltine with Cod Liver Oil and Malto Yerbine, which have enjoyed favorable recognition for many years—A cordial invitation is extended to you to visit Booth 54, where descriptive literature and samples are available

Why Days...

WHEN HOURS WILL SUFFICE

THE overwhelming discomfort of congestive heart failure and the progressive character of the syndrome demand prompt restoration of cardiovascular dynamics Orally administered Digitaline Nativelle—the chief active glycoside of Digitalis purpurea—produces initial digitalization in but 6 to 10 hours instead of days Digitaline Nativelle the original digitoxin also offers these advantages

- Virtual freedom from locally induced nausea and vomiting
 - Uniformity of potency—dosage calculated on basis of weight of drug
- Rapid and complete absorption direct from the stomach intravenous dose identical with oral.
- · Free from the mert dross of whole leaf digitalis

Average digitalizing dose 1.2 mg $\,$ maintenance dose from 0.1 mg to 0.2 mg daily

Physicians are invited to send for complimentary copy of the brochure Management of the Failing Heart and a clinical test sample of Digitaline Nativelle sufficient to digitalize one patient

VARICK PHARMACAL COMPANY, INC
A Division of E. Feogera & Co. Inc.
75 Varick Street, New York 13 N Y

How Supplied

Digitaline Nativelle is available through all pharmacies in 0.1 ms. tablets (pink) and 0.2 ms. tablets (white) n bottles of 40 and 230 and in ampules of 0.2 ms. (1 cc.) and 0.4 ms. (2 cc.) in packages of 6 ampules and 50 ampules.

Mead Johnson & Company, Evansville, Indiana (Booths 97 and 98) "Sevamus Fidem" means We are Keeping the Faith Almost every physician thinks of Mead Johnson & Company as the maker of Devtri-Maltose, Pablum, Oleum Percomorphum, and other infant diet materials, including the new precooked oatmeal cereal, Pabena But not all physicians are aware of the many helpful services this progressive company offers physicians A visit to Booths 97 and 98 will be time well spent

Medical Film Guild, New York (Booth 111), through their Medical Films That Teach, presents a refresher course in fundamental medical problems. This program, during the war period, kept the military medical man abreast of modern civilian practice. These new subjects reorient the military doctor to civilian procedures. These films, representing several years of research, are condensed into half-hour productions, each acting as a visual textbook. They review such subjects as Parkinson's disease, the major neuralgias, cervicitis, otolaryngologic diseases, contagious diseases, arterial blood pressure, hypothyroidism, and industrial medicine. They are available to medical societies, medical schools, and hospitals, and include projection service at no charge through grants for postgraduate instruction

Merck & Co, Inc, Rahway, New Jersey (Booth 46) With increased knowledge concerning penicillin, it is known that there are at least four individual forms, namely penicillin G, F, K, and X. It is the G form that is of most importance in medicine today, and it is this form, in high purity and without the presence of the F, K, and X entities, that is supplied as Crystalline Penicillin G Sodium Merck Streptomyoin, now also well known by the medical profession for its established value in the treatment of certain diseases, as well as its potential value in others, is the result of a research program brilliantly conceived and methodically carried through to a successful conclusion Merck production of streptomycin has been steadily increased so that adequate supplies are available for medical needs Antibiotics have been chosen by Merck for their display at the 1947 meeting Chemical, pharmacologic, and medical information is given Other fields, medical and nutritional, in which the Merck Research Laboratories are vitally interested, include the amino acids, the vitamins, the sulfonamides, choline derivatives, and anesthetic agents

The Wm S Merrell Company, Cincinnati, Ohio (Booth 114), will feature Amino-Concemin This nutrient tonic, designed to speed convalescence, contains the established Bearmelow from liver Tea

vitamins, the whole B-complex from liver, rice bran, and yeast, iron and 15 per cent protein hydrolysate. Its rich, winey flavor represents an unusual taste accomplishment in a preparation of liver, iron, and amino acids.

Philip Morris & Company, New York (Booth 88), will demonstrate the method by which it was found that Philip Morris Cigarettes, in which diethylene glycol is used as the hygrosopic agent, are less irritating than other cigarettes. Their representative will be happy to discuss research on this subject, and problems on the physiologic effects of smoking

The C V Mosby Company, St Louis, Missouri (Booth 89), extends an invitation to visit their exhibit where new medical publications of the C V Mosby Company, such as Rubin's Uterotubal Insufflation, Clendening-Hashinger's Methods of Diagnosis, Ackerman Regato's Cancer, Trieger's Atlas of Cardiovascular Diseases, Mobley's Synopsis of Operative Surgery, will be displayed

National Dairy Council, Chicago, Illinois (Booth 60) You are cordially invited to visit the National Dairy Council exhibit of health education materials Booklets and posters giving timely and authentic nutrition information will be on display. This literature may be used for distribution to patients or for the reception room. Sample material may be requested.

The National Drug Company, Philadelphia, Pennsylvania (Booth 65) You are cordially invited to visit our exhibit. Of specific interest will be the newest developments of our Research Laboratories, namely, our amino acid products—Aminonat, Aminovite, and Protinal Also on display will be our time-tested, Council Accepted Biologicals, including the series of multiple antigens for simultaneous immunization

The Nepera Chemical Company, Yonkers, New York (Booth 85), cordially invites the members of the Medical Society of the State of New York to visit their exhibit and to discuss urinary antisepsis, with particular reference to Mandelamine, a chemical combination of mandelic acid and methenamine. In addition to increased effectiveness with comparatively small dosage in the treatment of urinary infections, Mandelamine offers advantages of ease of administration and virtual freedom from by-effects. An authoritative booklet and literature are available for your review, as well as samples for clinical trial

Nutrition Research Laboratories, Chicago, Illinois (Booths 19 and 20), will feature Pendarvon Granules, a source of amino acids and vitamins of the B-complex in a readily dispersible, palatable form Taste samples of the new product will be available to interested physicians. In addition on display will be Ertron—Steroid Complex, Whittier, in both oral and parenteral forms, Infron Pediatric, a new approach to the problem of rickets prophylaxis, and Bezon, Whole Vitamin B-Complex plus Vitamin C in a much improved formula. The latest literature and information relative to the products on exhibit will be available at our booth, and we welcome the opportunity of meeting with members and guests of the Society

Ortho Pharmaceutical Corporation, Raritan, New Jersey (Booth 69), will exhibit their well-known line of gynecic pharmaceuticals, featuring Nidoxial for nausea and vomiting of pregnancy You are cordially invited to visit Booth 69 where samples and literature will be available

Parke, Davis & Company, Detroit, Michigan (Booth 47) Representatives of Parke, Davis & Co, well-informed concerning progress in pharmaceutical research, and desirous of presenting new advancements to you, will be in attendance at our Technical Exhibit to discuss the nature and employment of new and present products Displayed will be such outstanding products as Theelin, Mapharsen, and Adrenalin preparations The latest type of biolog-[Continued on page 784]

Must

INCREASED IRRITATION follow

INCREASED SMOKING?

PEOPLE are smoking heavily far more than ever before. To minimize nose and throat irritation due to smoking, may we suggest the cigarette proved* definitely and measurably less irritating Philip Morris

This proof of Philip Morris superiority is dependent not only upon laboratory evidence, but on clinical observation as well. Research was conducted not by anonymous investigators, but by recognized authorities and published in leading medical journals

The fact is Philip Morris advantages result directly from a distinctive method of manufacture described in published reports

*Laryngoscope Feb 1935 Vol XLV, No 2, 149 154; Laryngoscope Jan. 1937, Vol XLVII No 1 58-60 Proc. Soc. Exp Biol. and Med., 1934 32, 241; N Y State Journ. Med., Vol. 35 6-1 35 No 11, 590-592.

[Continued from page 782]

icals will be on display Likewise, penicillin and other therapeutic agents of antibiotic, biologic, and chemotherapeutic interest will be shown. We sincerely invite your visit to this exhibit

Pet Milk Sales Corporation, St Louis, Missouri (Booth 110) A complete display of material illustrating the time-saving Pet Milk services available to physicians Specially trained representatives will be in attendance to give you information about the production of Pet Milk and its use for infant feeding Miniature cans will be given to physicians visiting the exhibit

Picker X-Ray Corporation, Rochester, New York (Booth 3), will exhibit their Century apparatus, a complete self-contained diagnostic installation for radiography and fluoroscopy in all positions. This apparatus is available in either 100 or 200 milliampere capacity

Pitman-Moore Company, Indianapolis, Indiana, (Booth 27), extends a cordial invitation to all members and guests of the Medical Society of the State of New York to visit their booth. A number of representative pharmaceutical and biologic products will be displayed "Council Accepted" biologics will be featured including influenza virus vaccine, poison ivy extract, grass pollen extracts, etc. In addition a number of pharmaceutical specialties will be displayed, including a recent research development of our laboratories—Magmoid Sulfalac—a palatable, flavored, creamy, stable suspension of semicolloidal sulfathiazole and sulfadiazine plus the addition of sodium lactate. The Pitman-Moore Company's Iod Ethamine products and six outstanding "Council Accepted" digitalis products will also be on display

Procter and Gamble Co, Cincinnati, Ohio (Booth 7), features the current series of time-saving leaflet pads for doctors "The Hygiene of Pregnancy," newest in the series, is being offered for the first time. Doctors are also invited to reorder the first time. Doctors are also invited to reorder the first three pads in the series, "Instructions for Routine Care of Acne," "Instructions for Bathing a Patient in Bed," and "Instruction for Bathing Your Baby". Additional leaflet pads are being prepared, designed to save doctors' time in answering patients' questions on routine home care.

Rahm Instruments Inc., New York (Booth 108), will have in operation their Direct Recording Electrocardiograph Electroencephalographs, electroshock ther-

apy equipment, cortical stimulators, and other electro-medical apparatus will also be on display

Rare Chemicals, Inc., Flemington, New Jersey (Booth 118) Preparations exhibited by Rare Chemicals, Inc will include Acidolate (nonlathering liquid) and Dermolate (new lathering cake), both nonirritating skin detergents, Eucupin, local anesthetic with prolonged analgesic action, Gitalin, digitalis preparation, Salysal, antirheumatic analgesic, and Testosterone Propionate, "Rare Chemicals" androgenic preparation

L & B Reiner, New York (Booth 64) We invite your investigation of the EPL Cardiotron, the first successful direct-recording electrocardiograph A visit will show you why this has been called "the greatest advance in electrocardiography in twenty years" Note such exclusive features as the automatic time check, complete interference elimination, and complete lack of base line wandering, the last two being added features of our new model. Let us produce for you an instantaneous, permanent, accurate recording on yourself. Also on display will be found the Jones Motor-Basal Metabolism apparatus, the unit which has become the standard of metabolism accuracy and efficiency throughout the The exclusive features of the Jones apparatus include automatic check on accuracy, elimination of the use of barometer and thermometer, and complete patient comfort Orders can be placed for immediate delivery

J B Roerig & Company, Chicago, Illinois (Booth 77), will exhibit at their booth interesting products for use in arthrit s, anemia, and dermatologic conditions. Company representatives will be on hand to explain these various products in detail. Attending physicians are cordially invited to call at the Roerig display.

Rystan Company, New York (Booth 102) Chloresum Solution (Plain) and Ointment containing chlorophyll derivatives are natural, nontoxic healing agents indicated in the treatment of burns, wounds, chronic ulcerative lesions, and dermatoses, they accelerate healing, reduce scar formation, and effectively deodorize malodorous lesions Chloresum Nasal Solution likewise decongests the mucosa in inflammatory conditions of the nasopharynx and sinuses

Sanborn Company, Cambridge, Massachusetts (Booth 25) Visitors at this booth will see a demonstration of the new direct writing Sanborn Viso-Cardiette, amazingly simple electrocardiograph which provides finished and permanent cardiograms on the very instant of recording. Also shown, will be the Instomatic Cardiette, long famous photographic type electrocardiograph. For doctors interested in metabolism testing, there will be news and information about the newly designed Metabulator.

Sandoz Chemical Works, Inc., New York (Booth 48) Now released, the new anticonvulsant, Mesantoin (methyl-phenyl-ethyl-hydantoin), for the control or reduction in frequency of epileptic seizures Recently introduced products shown are Dihydroergotamine (DHE 45), improved nonnarcotic relief for migraine, Glysennid, crystalline glycosides of senna leaves, Ipesandrine, the active alkaloids of Dover's Powder in pure form combined with ephedrine Also displayed are Cedilanid, Gynergen, Bellergal, Belladenal, Calglucon, and Neo-Calglucon

Saratoga Springs Authority, New York (Booth 43) This exhibit consists of a photographic montage designed to show facilities available to the public at The Saratoga Spa as part of the health service of New York State The photographs were taken in and about the various buildings on the State's 1,200-acre reservation They display the bottling and distribution of the natural mineral waters, scenic views, recreation facilities, and various treatments

using natural mineral waters as given at the bath houses. These include mineral baths and packs, as well as heat cabinet, light ray, and other treatments State-bottled geyser water will be served by an attendant throughout the meeting.

Schenley Laboratories, Inc., New York (Booth 55) This exhibit is devoted entirely to penicillin and penicillin products, and features chinical illustrations of treated patients. The complete apparatus for penicillin aerosol treatment of respiratory infections by inhalation is demonstrated to interested physicians by well-informed attendants at the booth Descriptive literature concerning this treatment method and various Schenley Laboratories' products are supplied on request

Schering Corporation, Bloomfield, New Jersey (Booth 112), will feature the potent oral estrogenic hormone, Estinyl (ethinyl estradiol), the oral progestin, Pranone (anhydrohydroxyprogesterone), and the oral androgen, Oreton-M (testosterone propionate), Progynon-B (estradiol benzoate), Proluton (progesterone), and Cortate (desoxycorticosterone acetate), will also be displayed. The new effective treatment for ophthalmic infections, Sodium Sulfacetimide Solution 30 per cent will be of interest, as will be the clinically safer sulfonamide combination Combisul-TD and the radiographic medianeric representatives will be present to welcome physicians' inquiries

Julius Schmid, Inc., New York (Booth 33) Quickly and easily you may examine by means of new photographic reproductions the latest scientific evidence which indicates precisely the outstanding qualities inherent in Ramses Gynecological Products, every one Council Accepted Proper use under your direction gives your patients the highest possible degree of protection, judged by recognized authoritative standards

G D Searle & Co, Chicago, Illinois (Booth 68), will show a number of products of Searle Research which have contributed so much to the armamentarium of the physician, including Searle Aminophylline, Metamucil, Ketochol, Floraquin, Diodoquin, Pavatrine, Pavatrine with Phenobarbital, Gonadophysin, and Tetrathione Featured will be the new Aminophyllin Suppositories, the Searle brand of aminophylline suppositories, which remain stable at temperatures up to 130 F, but which liquefy readily under conditions of use

Sharp & Dohme, Inc, Philadelphia, Pennsylvania (Booth 62), extends a cordial welcome to all visitors at booth 62. New antibiotic preparations, including Prothricin, nasal decongestant, and Tyroderm, tyrothricin cream, are being featured along with Sulfathalidine and Sulfasixidine, intestinal bacteriostatic agents. Lyocyte Powder, dried human blood cells, and Lyovac, normal human plasma, complete the items on exhibit

Smith, Kline & French Laboratories, Philadelphia, Pennsylvania (Booth 44) Dexedrine Sulfate is featured at this exhibit. Few therapeutic agents have risen so dramatically and rapidly to pre-eminence as Dexedrine Sulfate. Today, its widespread clinical usefulness in depressive states and weight reduction makes this drug undeniably the central nervous stimulant of choice. Dexedrine is remarkable in that it spares the patient the disturbing consciousness of drug stimulation, is virtually a

single action drug, and has an extremely wide margin of safety. Our specially trained professional representatives will be glad to answer questions concerning the possible uses of our products in your practice.

Specific Pharmaceuticals, Inc., New York, (Booth 113), considers it a privilege to be invited to participate in the technical exhibits at the 141st Annual Meeting of the Medical Society of the State of New York Profenil, the non-narcotic, synthetic antities of our manufacture along with other specialities of our manufacture Samples, literature, and information will be available to members of the medical profession

Spencer Incorporated, New Haven, Connecticut (Booth 45) You are cordially invited to visit our exhibit showing individually designed supports for abdomen, back, and breasts We are featuring a new support for men, the Spencerflex In addition, we would like you to see our breast forms for patients who have undergone mastectomy

E R. Squibb & Sons, New York (Booth 40) Penicillin blood levels following administration of crystalline penicillin G sodium in oil and wax

Frederick Stearns & Company Division, Detroit, Michigan (Booth 49), cordially invites you to visit our exhibit Members of our professional staff will be in attendance to discuss such products as Parenamine, Demerol, various Neo-synephrine products, Fergon, Adnephrin, and the complete list of Stearns ethical specialties Please register for any samples you may wish sent you

Swift & Company, Chicago, Illinois (Booth 12) Trained dieticians will be in attendance at the Meats for Babies and Juniors Booth to demonstrate the desirable characteristics of flavor and texture of the six distinctive varieties—beef, lamb, veal, pork, liver, and heart, in the two types strained and diced—Visitors may register for samples and literature or special information wanted

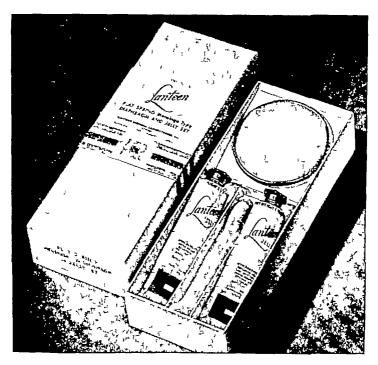

Tampax Incorporated, New York (Booth 86) If you have not yet familiarized yourself with Tampax, the preferred, three-absorbency, intravaginal, menstrual tampon, you will wish to visit the Tampax exhibit where educational consultants are in attendance. If you are already acquainted with Tampax's many advantages, be sure to register for the latest literature or educational material and samples of our product

Teca Corporation, New York (Booth 74), shows its improved models of the well-known Two Circuit Hydrogalvanic units for office and institutional work Among these are the conveniently operated four tank units for the treatment of and through the extremities. Of interest are the new Teca Bi-Trodes, modern instruments for testing and localized treatment Also shown are the new Teca low volt generators CD6 and SP3, with original new facilities, permitting a more efficient and varied utilization of galvanic and sinusoidal currents. Another low-volt unit HP4 is used for ion-transfer and electro-diagnosis

fessional samples and literature on Vi-Syneral, Poly-B, Vi-Litron, Hypervitam, Lipo-Heplex, Dalsol, Desiver, Amiprote, and others

Upjohn Company, Kalamazoo, Michigan (Booths 93 and 94) The first panel of the display outlines diagrammatically the mechanism of blood clotting Next to that is a panel dealing with the use of thrombin as a sort of biologic cement for attaching skin grafts. The center panel describes the use of Gelfoam (a tissue absorbable sponge) moistened with thrombin as a hemostatic agent. Then the absorption of Gelfoam in tissue is demonstrated by a series of histologic specimens on the fourth panel. The final panel depicts the clinical use of the natural anticoagulant, heparin

The University of Chicago Press, Chicago, Illinois (Booth 34) The exhibiting of Books From University Presses is an outgrowth of the Association of American University Presses Each press represented is a separate publishing company devoted to the production of important technical and scholarly works, which might otherwise go unpublished, as well as general books of vital interest to all Americans Because of their common goals, and because some of them are too small to sponsor exhibits alone, these presses have combined to present their books in a single impressive display

Varick Pharmacal Company, New York (Booths 21 and 22), manufacturers of Digitaline Nativelle, plans an interesting and informative exhibit at the forthcoming meeting Enlarged full color kodachromes of many gross cardiac specimens and photomicrographs of cardiac pathology will be displayed, as well as interesting electrocardiograms Arrangements are also being made to reproduce phonographically heart sounds of various valvular lesions

Walker Vitamin Products, Inc., Mt Vernon, New Therapeutic vitamin prepara-York (Booth 96) tions, protein products, and individual amino acid items will be presented at this exhibit Also, the oral and injectable combinations of vitamins and amino acids as used in the hearing studies reported in the December Archives of Otolaryngology two preparations-Hyvanol and Amvitol-may prove to be of great value in the treatment of certain types of nerve deafness. Our new product—Aminotabs, providing 2 Gm of Lactalbumin and Yeast Hydrolysate per tablet, will also be on display and samples will be available Each tablet provides the following essential amino acids Arginine 530 mg, Histidine 280 mg, Isoleucine 1,068 mg, Leucine 1,427 mg, Lysine 1,282 mg, Methionine 293 mg, Phenylalanine 549 mg, Threonine 748 mg, Tryptophane 265 mg, and Threonine 748 mg, Tryptopnane 200 mg, Tryptopn the taste and may be chewed as necessary to supply the desired protein intake

Wallace Laboratories, Inc., New Brunswick, New Jersey (Booth 101), will feature their complete line of ethical dermatologicals. Physicians are invited to visit their booth for full information on Intraderm Sulfur Solution for acne vulgaris, Bactra-Tycin and Intraderm Tyrothricin Solution for pyodermas, Intraderm T C A P Solution and T C A P Fungicial Shampoo for the treatment of times capits

Wallace & Tiernan Products, Inc., Belleville, New Jersey (Booth 53), is exhibiting Azochloramid, their stable chlorine antiseptic, Monomestrol, a synthetic estrogen, Desenex, the undecylenic acid-zinc undecylenate fungicide, and Sotradecol, the new sclerosing agent for the injection therapy of varicose veins. You are cordially invited to visit our exhibit. We will welcome your inquiries and comments.

The Washington Institute of Medicine, Washington, D.C. (Booth 78), will exhibit their world-famous specialized Quarterly Reviews in Surgery, Obstetrics and Gynecology, Pediatrics, Medicine, Urology, Dermatology and Syphilology, Psychiatry and Neurology, Ophthalmology, Otorhinolaryngology and Broncho-Esophagology, Allergy and Applied Immunology, and General Practice Clinics, a specialized general journal for the general practitioner

Westinghouse Electric Corporation, New York (Booth 9) The main feature of the Westinghouse display will be a vertical fluoroscope We will also display a Fluorothin Illuminator which utilizes fluoroscopic lamps instead of the conventional incandescent type, a PFX Viewer used to view 70mm x-ray films optically, enlarging them for easier study, and a Thin Window Lamp, an ultraviolet lamp used for skin therapy

Westwood Pharmacal Corp, Buffalo, New York (Booths 37 and 38), particularly welcomes physicians in their own home City of Buffalo, and invites all members of the Society to pay us a visit. We are displaying the soapless detergents, Lowila Cake and Lowila Liquid, which are suggested whenever soap is contraindicated. We are also displaying the new improved Westhiazole vaginal single dose disposable applicators for the treatment of vaginitis and cervicitis. Please let us demonstrate how easy it is to use these applicators for home and office treatments

White Laboratories, Inc., Newark, New Jersey (Booth 42), present information regarding White's Sulfathiazole Gum, expressly formulated for topical chemotherapy in oropharyngeal infections, White's Otomide, a more effective means of topical chemotherapy in ear infections, and a new specialty, White's Mol-Iron Tablets, a new and definite advance in the treatment of iron deficiency anemias White's ethically promoted vitamin specialties are also featured You will find a very cordial welcome by White's medical service representatives in charge of the exhibit

Winthrop Chemical Company, Inc. New York (Booths 35 and 36), extends a cordial invitation to visit their booth where representatives will be on hand to discuss the latest therapeutic contributions made by this firm

tributions made by this firm Featured will be Demerol, analgesic, spasmolytic and sedative, Digisidin, pure crystalline digitoxin, the drug of choice for routine digitalization, and Pontocaine-Neusynephrine, for the relief of ocular and nasal congestion and irritation

all the alkaloids of optim in highly purities, water soluble form, suitable for injection. Thousands of physicians have found Pantopon a dependable preparation in all cases requiring optiates. Pantopon Roche is available in ampuls, hypodermic and oral tablets, and in powder form

Treat the itching, too

In CHICKENPOX, MEASLES and SCARLET FEVER your first care will be the systemic symptoms. Then, the distressing itching and the dangerous urge to scratch must be controlled, to guard against infection and scarring

Control the itching with ENZO CAL.

ENZO-CAL contains near colloidal calamine and zinc oxide with benzocaine in a soft pleasantly fragrant, greaseless cream Its soothing action is prompt and prolonged

Parents like it because it is so clean, convenient and pleasant to use. Will not stain clothing or bed linen

ENZO-CAL is available in 2 oz tubes and 1 lb jars at your local pharmacy Sample and literature will be sent to physicians on request.

105 East 45th Street, New York 17, N. 1

Digisidin --- pure crystalline digitaxin --- has come to be regarded as the drug of choice for routine digitalization.

It is the main glycoside of Digitalis purpurea. It is 1000 times as potent as standard digitalis leaf. Hence such small doses are needed that it is nonirritating to the gastro-intestinal tract.

Digisidin -- standardized by weight and by bio-assay -- never varies in composition or potency.

It is absorbed completely when given by mouth. Digitalization may be accomplished in from 6 to 10 hours by one oral dose (usually only 1.2 mg.).

Available in tablets of 0.1 and 0.2 mg. in bottles of 50, 100 and 500.

Brand of Digitoxin (crystalline)

"Over Forty-five Years devoted to pleasing particular people"

the characteristic response to Pyridium therapy

The prompt symptomatic relief provided by Pyridium is extremely gratifying to the patient suffering from distressing urinary symptoms such as painful, urgent, and frequent urination, nocturia, and tenesmus

Pyridium, administered orally in a dosage of 2 tablets $t \iota d$, will promptly relieve these symptoms in a large percentage of ambulant patients, thereby permitting them to pursue normal activities without undue discomfort

Acting directly on the mucosa of the urogenital tract, this important effect of Pyridium is entirely local. It is not associated with or due to systemic sedation or narcotic action

Therapeutic doses of Pyridium may be administered with virtually complete safety throughout the course of cystitis, pyelonephritis, prostatitis, and urethritis LITERATURE ON REQUEST

Yes, and experience is the best teacher in smoking too!

 $ho_{
m HE}$ wartime eigarette shortage was a real experience to smokers. Whether I they intended to or not, people found themselves emoking many different brands, learning by actual experience the differences in cigarette quality The result of all these comparisons was the biggest demand for Camels in history And today more people are smoking Camels than ever before.

We don't tamper with Camel quality Only choice tobaccos, properly aged, and blended in the time-honored Camel way are used in Camels.

According to a recent Nationwide survey:

More Doctors SMOKE CAMELS

than any other cigarette

pH VALUE The normal vaginal pH lies between 40 and 50 Both Lactikol Jelly (pH 415) and Lactikol Creme (pH 49) are within this normal range and so tend to maintain the proper pH value of the vaginal tissues

SPERMICIDAL POWER Both Lactikol Jelly and Lactikol Creme immobilize sperm instantly on contact

VISCOSITY The viscosity of Lactikol Jelly and Lactikol Creme is carefully controlled so as to maintain a suitable barrier action and avoid unaesthetic leakage in use

LUBRICITY Lactikol Jelly with a vegetable gum base,

provides a highly lubricating medium Lactikol Creme with a cream base, is less lubricating The choice be tween these lies with the preference of the patient

STABILITY Both Lactikol Jelly and Lactikol Creme remain stable for several years and can withstand extreme variations in atmospheric temperature

ACTIVE INGREDIENTS Lactikol Jelly: Lactic Acid, 1.5%; Glyceryl Monoricinoleate, 10%, Sodium Lauryl Sulfate, 0 2%; Oxyquinoline Sulfate, 0 05%

Lactikal Creme Lactic Acid, 0.5%; Glyceryl Monoricinaleate, 1.5%, Sodium Lauryl Sulfate, 0.6%

MOLEHILL or MOUNTAIN?

In Constipation—True or Alleged It's MUCILOSE

When the patient who declares himself constipated has made a mouncianous problem of over purgation from a modefull of underlying cause Mucliose—bland, hibricating bulk—is a valuable adjunct in correcting both the self imposed lixative habit and the primary incremel dysfunction.

Ample Incestinal bulk is assured by placing the patient on Mucilose pure concentrated bemicellulose from psyllium. More efficient Mucilose absorbs 30 trans its weight of water to form a bland colloidal gel—lubricates the Incestinal contents and gently stimulates perisasleis.

For physiologic re-education for more nearly normal evacuation and a regular "habit-time — is's Alsolius.

Mucilose

IN SPASTIC AND ATONIC CONSTIPATION Highly purified breakellaloss concestrate derived from Plantage Inflingit evallable as falses or results in 4 or, borrier and 16 or, consulers.

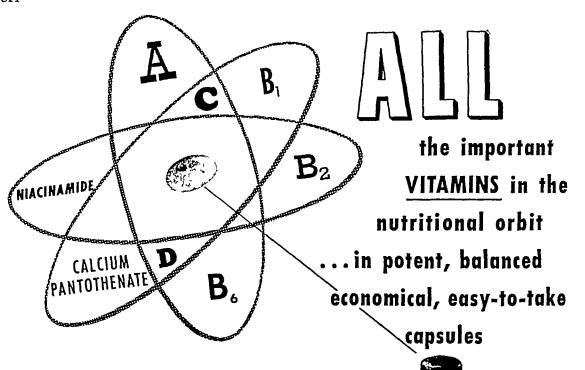

A trial supply of Mucliose will be sent to you upon request

PAUL EHRLICH, 1854-1915

Research Scientist

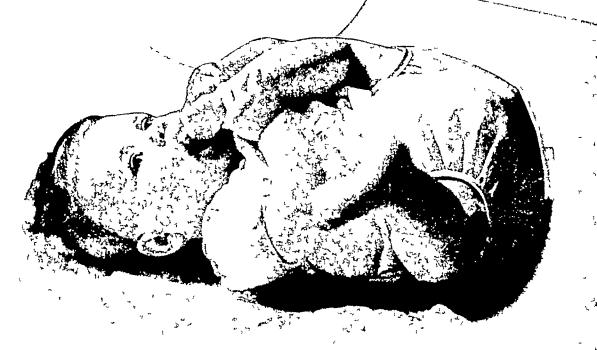

FATHER OF MODERN HEMATOLOGY AND CHEMOTHERAPY

Most of our modern medical knowledge of the blood stems from Paul Ehrlich's early work with anilline dyes. Ehrlich applied his dyes to the study of the cellular contents of blood and differentiated the blood picture of permicious anemia from that of secondary anemia. His more publicized achievements include the discovery of 606 the magic bullet, and the side-chain theory of immunization. In 1908 he shared the Nobel Prize with Metchnikoff for work on immunology.

THE FACILITIES and effort of the Harrower Laboratory Inc. we pledged to service of the cilied professions of medicine and pharmacy and the best interests of public health

To compensate for **B** factor

IN MILK DIETS OF EARLY

White

inadequacies

INFANCY

It is well recognized that cow's milk, and even human milk, does not supply important B vitamin factors in amounts adequate to maintain the average diet of early infancy at levels considered safe for optimal nutrition * The essential supplementation is conveniently and amply supplied by

WHITE'S MULTI-BETA LIQUID

—which provides the major B factors (thiamine, riboflavin and nicotinamide) in amounts directly proportionate to their inadequacy in such diets. In daily dosage of five drops, Whites Multi Beta Liquid raises the vitamin B content of the early infant diet to optimal levels. Non alcoholic, palatable, freely soluble in milk mixtures and orange juice, or suitable for direct administration. Notably stable.

Supplied in bottles (with suitable droppers) of $10 \ cc$, $25 \ cc$ and $50 \ cc$

*Marriott W Mck. Infant Nutrition 3rd Edition, revised by Jeans, Mosby St. Louis, 1941

WHEN YOU NEED A GOOD SUPPORT FOR REDUCIBLE HERNIA—may we suggest the advantages of

"custom-made" Protection, designed to meet the described needs of each particular case? Physicians, who know from experience, can tell you that Rice "custom-made" Supports for reducible HERNIA are truly different and that our methods are dependable. With dozens of different styles, shapes and types of pads at our disposal and with a full realization of our responsibility to those who put their faith in us -we respectfully offer our services for your approval Descriptive literature and measurement charts on request.

Avoiding both the peaks and the valleys in the control of hypertension, Nitrobar selects the middle course with gradual and prolonged hypotensive action. For arteriolar sedation, Nitrobar contains bismuth subnitrate—slowly absorbed, releasing a gradual stream of nitrite ions over a period of hours.

For central nervous system sedation, Nitrobar contains Butisol the intermediate sedative which induces neither the sudden drops of short-acting barbiturates nor the cumulative effect of the longer-acting barbiturates.

TWO MINUTES LATER. Water droplet retains shape. "Intraderm" droplet has spread and sceped into furrows. Small wetting angle demonstrates efficiency of "Intraderm" vehicle.

PHYSICAL PROPERTIES EFFECT SKIN PENETRATION

You can treat stubborn pyodermas more effectively with intruderm Tyrothricin

Increased wetting capacity and low sur face-tension are coupled with fat and water solubility These unusual physical proper ties insure that tyrothricin reaches the site of infection

Intraderm Tyrothricin contains 1 000 mmg. of tyrothricin per ml. (gramicudin 200 mmg.) The solution is a clear heat and time-stable liquid which penetrates normal and diseased akin through the follicles. It spreads on and sceps into diseased tissue.

Tyrothricin is rapidly bactericidal to most gram-positive organisms. It stimulates the formation of granulation tissue and is not inactivated by serum or necrotizing tissue.

In contrast to penicillin and the sulfona midea, sensitization to tyrothricin has not been reported.

Intraderm Tyrothrican is a true solution. It is not precipitated by body fluid electrolytes. It has both gramicidin and tyrocidine present as molecules. They diffuse rapidly and are quickly adsorbed on the surface of bacteria, Bactericidal action is enhanced.

DIENESTROL

A NEW IMPORTANT

WITH EXCEPTIONAL ADVANTAGES

"Dienestrol, a new synthetic estrogen, is potent, safe, and unusually well tolerated"

FINKLER, R. S., BECKER, S. J.A.M W A. 1:152, 1946.

"Dienestrol is a very potent estrogenic substance when given by mouth "

BARNES, J BRIT M J 1:601, 1912.

" a safe and non toxic estrogen"

BARNES, J BRIT M J 1:79 1944.

"Based on an admittedly small series, we thin! Dienestrol is the most satisfactory synthetic estrogen with which we have had experience"

SEVRINGHAUS, E. L., SIKKEMA S. H : A J MED (IN PRESS)

In all clinical studies to date, White's Dienestrol, administered orally, accomplished excellent therapeutic results with an incidence of side-effects of less than 1%

NOTE: Original research by White's makes Dienestrol generally available at a reasonable cost to all patients requiring oral estrogen therapy. Literature more fully describing White's Dienestrol will be forwarded to you immediately upon request.

DAILY DOSAGE: In the menopause—for mild to moderately severe symptoms, 0.1 mg to 0.5 mg, when symptoms are severe, or when the climacteric has been artificially induced, 0.5 mg to 1.5 mg. For the suppression of lactation—1.5 mg for three days, then 0.5 mg daily for one week. Supplied Small, coated tablets of 0.1 mg (white) and 0.5 mg (red), in bottles of 100 and 1000

3. Increased protein loss as in burns draining sinuses and abscesses nephrosis hemorrhage and malignancles

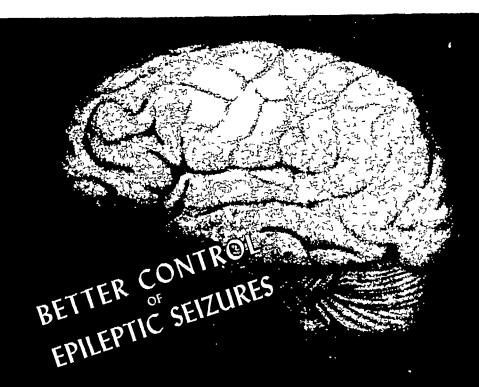

4. Need for the specific action of one or another of the amino acids as that of dl methionine in toxic

hopatitis or of folic acid in anomia

5 Deficiencies of vitamins of the B complex occurring in any of the above

Pendarvon is supplied in completely dissolving granules, in 8-oz. bottles Trial supply on request.

NUTRITION RESEARCH LABORATORIES . CHICAGO

Comparative studies have shown that in some cases better control of grand mal as well as petit mal seizures can be obtained with Mebaral than with corresponding doses of phenobarbital or diphenylhydentoin sodium. Mebaral is usually well tolerated and causes little or no drowsiness. The fact that it is tasteless simplifies its administration to children.

Mebaral may also be given in combination with luminal or diphenylhydantoin sodium.

The average dose for adults is from 3 to 6 grains daily; for children, from $\frac{1}{2}$ 5 to 3 grains. Tablets 0.03 Gm. ($\frac{1}{2}$ 5 grain), 0.1 Gm. ($\frac{1}{2}$ 9 grains) and 0.2 Gm. (3 grains).

Modern Management of Peptic Ulcer

Diagnosis

Time spent in taking a good case history may be saved many times over in successful treatment. Diagnosis may be easy, or it may require the most careful study with all help the laboratory can give

As a convenient aid to physicians Wyeth offers without charge complete yet compact diagnostic charts Filled out, these charts become the case history records of each patient

Valuable also in diagnosis is the information presented in technical motion pictures by Wyeth, in color—Peptic Ulcer, illustrating diagnosis, modern management and surgery, Intragastric Drip Therapy, which includes dramatic full color scenes inside the stomach of a living dog, and demonstrates continuous drip therapy with the Wyeth apparatus

Standard Treatment in the modern management of peptic ulcer is based on Amphojel —Alumina Gel, Wyeth Amphojel provides prompt relief from pain, complete security against alkalo sis or "acid rebound", nutritional and psychological advantages of a liberal bland diet, faster weight gain during treatment It is ideal for the control of gastric hyperacidity

Other Wyeth specialties valuable in treating peptic ulcer are

Amphojel without Flavor—an un flavored preparation

Amphojel Tablets—for the convennence of ambulatory patients

Amphojel with Magnesium Trisilicate
—for ulcer patients with constipation

Amphojel with Mineral Oil — for ulcer patients with constipation

Phosphaliel® (Aluminum Phosphate Gel)—for marginal ulcer, ideal for drip therapy in bleeding or refractory cases

Lactamin®—a complete protein di gest supplying all essential amino acids in predigested form

THOM TO GET THE DEST REGULTS

Any digitalis preparation will work with some degree of effectiveness. The many types available testify that each has one or more disadvantages which add to the burden of care for the individual case. Deterioration of the drug may occur from age or improper storage. Gastric irritation, inaccurate dropper dosage, and variability in absorption are among the more important problems met by the physician employing commonly used digitalis preparations.

Crystodigin (Crystalline Digitoxin, Lilly) overcomes every disadvantage inherent in traditional forms of digitalis. It is crystalline pure. It is stable. It produces no local gastric irritation. The dosage is accurate because the substance is weighed rather than computed in "units." Crystodigin is completely absorbed, a fact made apparent because it is equally effective whether given orally or intravenously. Then too, Crystodigin requires no change in the usual plan of digitalis therapy. Patients now taking conventional products may be changed to a maintenance dose of Crystodigin with ease. Complete literature is available upon request.

Crystodigin is available in 0.1-mg and 0.2-mg tablets, and as Ampoules Crystodigin, 0.2 mg, 1 cc.

NUMBER 8

Editorial

For New and Old Members of the Society

As this is written, the Annual Meeting of the Medical Society of the State of New York impends. It will be an important gathering at Buffalo, May 5 to 9, 1947 Its functions in brief are first, presentation of new developments in the progress of scientific medicine, second, the meeting and formal proceedings of the House of Delegates, including the election of officers of the Society and its delegates to the American Medical Association.

New members of the Society should be somewhat familiar with the methods by which, in section meetings, and the larger general sessions lectures by eminent authorates, scientific information is disseminated, because in their own county societies they will have listened to or participated in the same procedure. Old members will have provided much of the material heard at these sessions

The papers read at Annual Meeting sessions will be published during the year in the Journal. Names of the various session and section officers appear as the last item in the Table of Contents of the Journal in each issue, under the heading "Miscellaneous," subhead, "State Society Officera."

New members are not, as a rule, aware of what goes on in the meetings of the House of Delegates. If they have the curiosity to ask someone, possibly a doctor who has not himself been a delegate from his county society, they may be put off with some such statement as "that's where the medical politicians give out." Well, let us examine the facts.

Actually, the House of Delegates is composed of representatives from the sixty-one county societies of the State. It meets on the first day of the Annual Meeting, receives the addresses of the retiring President and the President-Elect which usually deal with broad aspects of medical policy in relation to the social, economic, and health problems of the present and future.

The Speaker of the House has previously designated the personnel of the numerous reference committees to which he then proceeds to route the resolutions presented by the various delegates, according to the nature of the subject matter of each as it is read on the floor of the House These resolutions have usually been prepared by the delegates of each county society well in advance of the Annual Meeting They present the

views of that society on a wide variety of Thus, actually, the inception of much of the policy of the State Society takes place in the prior meetings of the various delegations in their own counties resolutions which they present on the floor of the House are discussed in detail by the reference committee to which the Speaker The reference committee consigns them may call in, if it thinks necessary or helpful, the proponents of the resolution and any others, for or against, or especially wellinformed on the subject matter, for consul-It is tantamount to a public hear-At the conclusion of the hearing the reference committee taking into account all the argument for and against, writes its own opinion, either approving or disapproving the resolution in whole or in part

At a later time in the sessions of the House, the reference committees at the call of the Speaker present their recommendations to the House sitting as a Committee of the Whole Debate on the recommendations of the reference committees then occurs from the floor, and chairmen of the various county society delegations should be alert to see that all the members of their delegations are present in the House when the reference committee having their resolution makes its report and recommendation This report, after full debate, is voted on by the House The action of the House then

becomes the policy of the Medical Society of the State of New York

Too few new and, regrettably, too many indifferent older members of the Society fail to take the trouble to inform themselves about the functions and workings of the House of Delegates, their representative, professional policy-making body Yet now, when relations between doctors and government, doctors and the public, doctors and their own national association, the American Medical Association, should be the grave concern of every thinking member of the profession, it would seem appropriate for the entire membership of the Society to familiarize itself with the mechanism of the House, to know how resolutions are "processed" by hard working officers of the State Society and the county delegates

The House sessions end with the election of officers and delegates to the American Medical Association on the last day, after all other business has been concluded

The Editors urge all members of the Society to interest themselves in the committee work of their respective county societies, but especially our new members. The vitality and strength of any representative group reposes ultimately in those who will assume with vigor and interest the work of the organization. Know what it is, learn how it works, then roll up the sleeves and push. It is your Society

The Centennial Year

The New York Academy of Medicine is to be congratulated upon its one hundredth year of useful and forward-looking service to the people and physicians of the City of New York. It has lived up to its high standards of civic and social responsibilities with respect to the public health, the provision of accurate medical information, and its related program of professional and lay instruction.

Its magnificent reference library, housed in one of the City's outstanding edifices on Fifth Avenue at 101st Street, is among the finest in the country Recently, a building extension has been contemplated to expand the library facilities, to provide exhibit

halls, and to further the usefulness of the Academy to doctors and public alike

The work of the Committee on Medicine and the Changing Order is a notable contribution to the advancement of the study of the social and environmental factors responsible for illness and mortality, and of the changes in methods of medical practice and medical education thought to be necessary before the full benefits of modern curative and preventive medicine can be made available to all the people

The JOURNAL extends on behalf of the Medical Society of the State of New York sincere congratulations to the Academy on a century of notable public service

Editorial Function

In discussing the function of editorial writers, the New York Times' said

The editorial page performs its important function too, of informing and leading opinion They (editorial writers) are writers of opinion but at the same time they must be fair

We are living in probably the most dangerous period that humanity has ever expenenced. Strange, new, horrifying things are happening every day Worse than that, we hear about them at once We are given no tame in which to cool off and consider them They are the fodder upon which our most brilliant journalists and radio commentators gorge themselves—and regurgitate upon us

Medicine is supposed to be a learned profession. It ought to be It is the only one to which man confesses both his bodily and mental weaknesses. We yield to no one in our admiration for the presthood, yet no priest hears a confession as fully rounded as When a patient that of a hypochondriac confesses to a doctor he tells everything Why? He has a physical excuse for every spiritual infirmity of which he is so alarm ingly conscious

We are continually being cautioned about our editionals because they might hurt somebody's feelings Why shouldn't they? Feel

ings are being hurt every second of every hour, usually through malice, hatred, or uncharitableness If the doctor hurts you at least he does it with beneficent intent Suppose a doctor hurts a patient's feelings by telling him he has a cancer and should be operated upon If he wounds him with his right hand he is with the left hand holding out to him the chance of a future of health and happiness He is not inflicting sterile pain

The original definition of doctor is teacher In its larger sense the medical profession has forgotten that A teacher is, or used to be a man who dealt with facts, or at least tried to He gave you the rough with the smooth He taught you that life was a vale of tears. but provided you with as much lubricating fluid as he could to enable you to slide

around its harsher corners

We think that if there is any place surviv ing for free discussion it should be in the editorial columns of a medical journal Its audience is comparatively small. It is restricted, supposedly, to readers of education and intelligence If any columns should be open to free expression of opinions, to the pursuit of truth, regardless of whose toes are stepped on, those of a medical journal should be the ones.

Television and Health

The Bureau of Health Education, we are informed, is exploring new methods of spreading health information One of these is the telecasting of instruction on subjects which must be seen to be well comprehended

The moving picture industry has, in the recent past, developed excellent technics in that medium for audiovisual instruction, but the radio, until the advent of practical means of telecasting, has suffered from obvious limitations.

The experimental television series of the Bureau will encompass such subjects as the medical uses of the stethescope, x-rays, the basal metabolic rate, blood examinations, contagious disease precautions in the home, and methods of administering drugs

seems to us to be a fertile field for explora-Television will more and more reach in this country a public already conditioned by the sound picture technics

In commenting on the possibilities of this new field, its usefulness in teaching, for example, the nutritional value of foods, first aid, child welfare, and physical training, should not be overlooked. At the same time. its restrictions should be kept in mind

Says the Lancet 1

The value of television will be not so much in systematic education as in the stimulation of interest, that is, in propaganda by example demonstration of bathing the baby will have ful

¹ January 21, 1947

¹ Lancet (London) June 1, 1946 p 823

filled its purpose if it attracts fresh comers to the infant-welfare centre

The day is long past when the doctor sought, or was granted, a veil of mystery in which to invest his calling. But this does not absolve the profession from its duty of protesting against the irresponsible presentation of medical subjects to an unselected audience of laymen.

The point is well taken The possibility, of course, exists of making a host of neurotics, an army of self-medication addicts, a swarm of chin-milkers, nail biters, contoitionists, pulse-feelers, and the like How-

ever, good editorial judgment can be counted on to hold this to a minimum. After all, telecasting presents no problems that the sound pictures have not met intelligently and, with the cooperation of the medical profession, interestingly

Should untoward public reactions occur, the new medium could be utilized just as effectively in our opinion to kid them out of existence. Perhaps in the end such an approach to health instruction by stressing what not to do may prove to be the most useful.

National Health and Medical Service Problems

In many countries of the world, knotty problems arising from attempts by all concerned to improve medical service to the people are under discussion. Considerable acrimony marks nearly all attempts to arrive at their solution. In some instances dispute arises over principles, in others over procedure. Is there reason in all of this?

Certain of the Scandinavian countries have had well-conceived and, in the past, functioning health and medical services on a national basis, but which have not served the whole population. Presumably, these have been acceptable to the whole people, including some of the medical profession, they have been functioning for many years under governments of which the political philosophy and practice have remained stable.

In Great Britain one has seen since World War I a change in political philosophy, culminating in the installation of the first Socialist government in its history While political flux may be, and in this case has been, relatively rapid, the roots of certain national institutions, among which is medicine, are deeply embedded in conservatism, the national habit of mind in the past of the Eng-Those roots extend far into lish people the educational system, into the universities, into the dim distant beginnings of the That medicine, a conservative hospitals science and art, should have flourished under a conservative government and in a conservative habitat, one can appreciate

What happens when a relatively rapid

change of political philosophy and practice occurs? The French Revolution and the Red Revolution in Russia offer extreme examples. In Great Britain currently one becomes aware of the stresses incidental to the decision of a majority of the people through their government to embark on a frank program of socialism, including the nationalizing of their medical institutions

Had the attitude of the medical profession been other than frankly conservative toward the proposal for change, skeptical of the procedures, doubtful of the benefits actually to accrue, that would have been surprising The medical profession of Great Britain is aware of the successful and highly-enlightened medical service of the Scandinavian It is indubitably aware of the countries sorry mess into which the Continental profession has fallen, and the low quality of medical service which the Continental people must tolerate, hag-ridden by war, debt, demolition, and the lowest common denommators of socialism and communism, respectively

Yet in Great Britain the people for their own reasons declared for socialism after World War II Will this decision be permanent? The nationalizing of the Bank of England, the Railways, and the Coal Mines having been accomplished, the National Health Service is next. How do the British doctors feel about it? Will they cooperate with the government in negotiating with the Minister on the Regulations of the National Health Service Act? A plebiscite on the

question was taken of the whole profession, member and nonmembers of the British Medical Association The majority vote was "No " Says the British Medical Journal

No one, least of all doctors themselves can be otherwise than gravely disturbed by this profound division between the Minister and those upon whom he must rely to operate the National Health Service Act The general public and its representatives in Parliament cannot fail to be dismayed when they see on the eve of the putting into force of the National Health Service Act that its provisions are such as to conflict

British Medical Journal Dec '1 1946 p 947

with the principles laid down by the Negotiating Committee, representative of all sections of medical life. Both people and Parliament must surely believe that there is something radically wrong in this Act if the majority of those who are usked to work in it declare by a vote that its provisions are such as to convince the majority of British doctors that the Act is against the public good For this is what the vote means

Let it be pointed out here that it was the peoples' decision to place in power the government which framed the Act For better or worse, the will of the people is decisive

Current Editorial Comment

Some of the Unusual and Dangerous Effects of Benadryl. The knowledge of the beneficial effects of benadryl in certain types of allergic diseases was acquired in the course of the usual sequence of discovery, experimental study, and clinical tests on patients under controlled conditions. Since it was made available to the public in March, 1946, its expanded use has created a demand that at times has exceeded the supply of bena dryl This demand is to be expected for a drug believed to be useful in relieving the symptoms of allergy Physicians should familiarize themselves with the usual sideeffects of benadryl and keep abreast of the more recently discovered toxic effects that are unusual

In a recent issue of the Journal of the American Medical Association, under the head of Clinical Notes, are reports from four different sources two of them on the unusual effects, one on a prolonged toxic reaction and one on the dangers of self medication with benadryl Geiger et al 1 report the case of a woman, age 26 who developed the usual symptoms in a rather exaggerated form (palpitation, dimmed vision heartburn, and nausea) after having taken 300 mg of the drug over a period of three days Following the next dose of 50 mg (making a total of 350 mg.) she was found unconscious, cold, pale and pulseless. With appropriate treatment including epinephrine (0 50 cc of a 1 1,000 solu tion) the pulse was palpable in thirty minutes and the patient had returned to normal in three hours. Four days later the administration of benadryi was carefully resumed Again the same symptoms returned after she had received 300 mg in a period of three days At that point the treatment was stopped, and the symptoms did not go beyond the usual side-effects plus disorientation and excitement. Benadryl was withheld, and she felt normal in two hours without further treatment

Weil² reports the case of a boy, age 3¹/₂ years who received 50 mg of benadryl twice a day for a period of three days. To relieve an attack of sneering at midnight of the third day, he was given two capsules (100 mg) of benadryl Thirty minutes later he sat up in bed singing laughing starry-eyed and "acting as if he were drunk." In addition the patient has muscular twitching of the face, spastic movements of the extremities urmary incontinence finally becoming irrational and diving from his bed to the floor, where he landed on his head laughing. He was returned to bed and given 1/2 grain of seconal After fifteen minutes he slept fitfully, but muscular twitching, athetoid movements slurred speech. and attempts to repeat the "dive" out of bed continued for three hours

The prolonged effects of benadryl is reported by Schwartzberg and Willerson 1 The nationt took 23 capsules (each 50 mg.) in twenty dayssome days one capsule never more than three in one day, and some days none In addition to the usual symptoms of mental lethargy, drowsiness. weakness, numbness tingling, and pallor, the patient showed evidence of neuritis, manifested by a feeling of tightness and weakness in the upper extremities and, to a slight extent, behind the knees. Those symptoms came on toward the end of the second week after beginning the use of benadryl (March 23 1946) and continued until April 21, eight days after the medication was discontinued on April 13 About July 1 1946 his recovery was considered complete, with the exception of slight discomfort beneath the right anterubical fossa on carrying heavy objects or on great pronation of the forearm.

393 (Feb. 8) 1947

¹ Geiger Jacob, et al.: J.A.M.A. 133: 292 (Feb. 8) 1947 ² Well, Harry R.: J.A.M. A. 133: 293 (Feb. 8) 1947 ³ Schwartsberg S. and Willerson, D.: J.A.M.A. 133: ³ Chil. B. 1947

Borman⁴ reports the history of a woman, age 18, given a prescription for 48 capsules, each containing 50 mg of benadryl. The two capsules taken as prescribed on the first day caused such great relief of her symptoms of asthma that she decided to use them oftener. During the following three days, the balance of the 48 capsules were taken. She became drowsy, irrational, left her bed at night, was lethargic, confused, and disoriented. For two nights she had "suffocating spells." She was apparently fully recovered in forty-eight hours.

To the long list of previously reported side-effects of benadryl, which may be regarded as usual or to be expected, are added one (moderate dosage) record of a shock-like reaction with collapse and unconsciousness, one (a double dose in a child) of severe cerebral disturbance with slurred and irrational speech, one (low dosage for twenty days) of prolonged effects of benadryl, with a toxic neuritis continuing for three months, and a case of gross overdosage self-administered From these reports, it is clear that (1) the dose of benadryl should not exceed 50 mg, (2) the dose should be within the accepted standard of 2 mg per pound of body weight, (3) the prolonged use of benadryl, even in moderate dosage, may be dangerous, (4) moderate doses even for a short time, may cause serious symptoms, and (5) the dangers of selfmedication are heightened by the mental impairment and lack of judgment that may accompany the therapeutic use of benadryl

Aid for the Insane Bills calling for the naming of a temporary State commission to determine the need for expanded local psychiatric care, and to frame a program for State aid to localities for this purpose have been presented to the legislature Overcrowding in mental hospitals of the State, which now house well over 100,000 patients, is without question a sound reason for exploring every possibility for the local care, treatment, and cure of psychiatric cases

The increase in number of these unfortunates is alarming, but in a war and postwar era not unanticipated Political, technologic, and social change occurs rapidly in our current civilization. In the same day's newspaper one reads of experimental supersonic airplanes, streamlining of Congress, socialization of the institutions of a con-

4 Borman, Milton C J.A M.A. 133 394 (Feb 8) 1947

servative Britain, exploration of the Antarctic, atomic energy parleys, abysmal racial discrimination, wars of all kinds, spheres of influence, wonder or miracle drugs, balanced budgets and lower taxes, restoration of cathedrals, mass starvation, wrecks, airplane crashes, international legalism, cartels, and export of black teeth to Siam Day after day the inconsistencies, absurdities, paradoxes, and achievements that constitute the news are funnelled by press and radio, cable and telephone into a continual stream, an incessant beat upon the consciousness of the citizentaxpayer

Under the circumstances, one is prone to query Who's loony now? The uncertainty concerning who is and who is not well-balanced is a phenomenon of community concern and should be handled as such From the statistics currently being published it would seem as though nearly everyone living in any community in peacetime is either a potential psychopath, or happens to an accident, or possibly both The problem and its various solutions seems to us a local responsibility to be solved locally as far as possible with whatever

state aid may be necessary

Mounting Accident Rate The National Safety Council reports that in 1946, 100,000 persons were killed in this country and 10,400,000—one out of every thirteen inhabitants—were injured ¹ All the most important classifications of accidents showed rises over 1945

Certainly this is not because of failure of the various agencies concerned with accident prevention to urge caution. Physicians are daily taxed by the effort to conserve what may be salvaged from such human wreckage as may not be killed outright. Hospitals are sorely put to it to find room and nursing care for the more serious cases. The cost in time lost and in money of the 10,400,000 injured reaches astronomic figures.

It is time that inexcusable carelessness, indifference, and waste in human resources were curbed. The Medical Society of the State of New York might well take the lead in combatting in this State, in whatever ways might seem appropriate, such appalling loss of life and injury to persons.

¹ N Y Times, February 6, 1947

PHYSICAL MEDICINE IN TRAUMATIC INJURIES

GEORGE G DEAVER, M D

(From the Department of Physical Medicine Bellevie Hospital)

THEN we consider the hazards encountered in the home, on the streets in sports and in industry, and the people's carelessness and desire for speed, the outcome is bound to be an increasing number of traumatic injuries. There were 11,000 soldiers wounded on the beaches of Normandy in the first ten days after "D Day vet, even with curtailed traffic automobile ac cidents alone accounted for more than twice that many civilian casualties in the same ten days During four years of war there were approve mately 11,000 amputations in the Army but we have nearly 30 000 amputations from disease and accidents among our civilian population each

The treatment and, particularly the rehabilita tion of those disabled and handicapped through traumatic injuries is not a new one but the war has focused the attention of the medical profession and our people on this great national problem, and the necessity for its solution

It is the opinion of the majority of physicians and surgeons who served in the armed forces that physical medicine contributed largely to the splendid results obtained in traumatic war in juries. These same physical agents, when properly applied, will give the same good results in the treatment of traumatic injuries of our civilian population

The various forms of therapy included in physical medicine are physical therapy, occupational therapy, and rehabilitation Physical therapy deals with the management of disease by means of physical agents such as light, heat cold water electricity, and mechanical agents Occupa tional therapy includes the use of the arts and crafts, dramatics, music and recreational activities for functional and diversional treatment. Physical rehabilitation includes reconditioning activities and prepares the patient for the activities essential for daily living and working

The tissues which are most frequently involved in traumatic injuries are the skin muscles and tendons ligaments and joints bursa bones, nerves and blood vessels and internal injuries of the skull chest and thorax

It is evident that the subject of physical medicine in traumatic injuries cannot be discussed in a short period of time. It is possible, however to

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Symposium on Physical Medicine in Human Reconversion, Section on I hysical Medicine May 1 1940

discuss certain types of traumatic injuries and disabilities in which physical medicine offers the best methods of treatment.

Injuries to muscles and ligaments are the most frequent traumatic conditions treated by the family physician. The studies made by Lloyd1 and Lastwood' of injuries in physical activities in college and secondary schools reveal these interesting facts

Injuries to muscles and ligaments are reported as causing 61 per cent of the sports in juries among college men and 58 per cent of the mjuries among college women

In high school the number of injuries to muscles and ligaments is 54 per cent of the total injuries for the boys and 72 per cent for the girls

Injuries to the muscles and ligaments are also the most frequent injuries among our Major and Minor League baseball players, children in the elementary schools, and adults in the home Those tissues were injured most frequently in our army camps during basic training athletes and soldiers have learned the value of physical agents in the treatment of their injuries They will not be satisfied with advice to "rest" or to "rub" the injured part with liniment It is my firm conviction that unless the medical profession uses the physical modalities and manipula tive procedures which are indicated in the treatment of these minor injuries we can expect to lose more of our patients to the osteopath, chiropractor and so-called "bone setter"

Etiology and Diagnosis

Injuries to the muscles and ligaments are caused by direct and indirect trauma. A muscle injury is diagnosed by the physician as an acute traumatic my ositis Among athletes, however a muscle injury caused by a direct blow is called a bruise contusion or "charley horse," and those caused by indirect trauma are called muscle strains. They are also given specific names, such as "glass arm," "shin splints" "tennis el bow" tennis leg" pulled tendon," or "rider's strain" These names indicate the area of body involved, and/or the activity which caused the injury Injuries to the ligaments are diagnosed as sprains,

Pathology

When an injury occurs to the muscle tissue the muscle fibers, blood vessels, nerves, and connective tissue coverings are torn. Fluid and cells exude through the walls of the vessels and the area of the injury is gummed up by a sticky mass of lymph, exudated blood cells, and dead and dying cells of the part. When the injury occurs at the joint, synovial secretion is poured out by the synovial membranes of the joints and tendon sheaths. The injury to the sensory and motor nerves, and the pressure of the exudate causes pain and spasm in the muscles, while the hemorrhage produces the swelling, redness, and increased temperature of the part.

Treatment

The purpose of treatment is to accelerate the absorption of the hemorrhagic evudate, relieve the pain and spasm, and promote sound repair of damaged tissues, so that formation and subsequent contraction of the scar with loss of elasticity of the part does not take place These objectives cannot be obtained by continued rest or ımmobilization If rested completely while repair is taking place, the fibrous tissue contracts, adhesions form, and the resulting disability is limitation of motion at the joints and weakness of muscles In bacteriologic infection, absolute rest may be indicated because the inflammation is constantly at work In traumatic inflammation, however, absolute rest is not necessary as the cause of the inflammation is only momentary

The general treatment of traumatic injuries which involves the muscles, tendons, and ligaments is as follows

- Compression or Pressure Bandage The application of an all-fabric elastic bandage directly over the injured area is the best method in preventing swelling and accelerating the absorption of the hemorrhagic evudate felt or wool may be placed under the bandage The use of nonelastic material for compression bandages is contraindicated A certain amount of swelling is bound to occur and, if the part is too firmly strapped with adhesive tape, it increases the pain and interferes with the circulation When the bandage is applied the patient should be instructed to elevate the injured limb patient is treated immediately after the injury and a compression bandage applied, aspiration seldom will be necessary
- 2 Heat—The compression bandage and elevation of the part will have produced their maximum effect in about twelve hours. Heat is the next preferable form of treatment. With heat a better circulation is established by the capillary dilatation, congestion is relieved, and the swelling and thickening further diminished with the improvement of circulation. Absorption of the evidate will be hastened and the risk of organization of the excessive exidate or the formation.

of nodules lessened There has been a tendency to think of expensive special apparatus that generates "infrared rays" as the only source of therapeutic heat—If an object is heated to a temperature which is higher than its surroundings, an excess of infrared rays passes from it to nearby objects—The hot stove, steam pipes, open fireplace, incandescent lamp, heating pad, and hot water bag are all sources of infrared rays or heat—These sources can be utilized in the patient's home—In the physician's office, infrared and radiant heat lamps, and conventional and short-wave diathermy machines may be used

The principal reason for applying water to the part is to produce temperature changes. Thus, heat may be applied by warm water, hot compresses, or by using the whirlpool bath

- 3 Massage—Studies in the physiology of muscles have shown that any injured muscle is physiologically comparable with a fatigued muscle in that both require oxygen and washing if they are to regain their normal contractile function Heating the tissues will cause relaxation and vasodilation, but massage is a valuable method to keep the exudate moving and, thus, to hasten absorption
- 4, Exercise and Manipulation Movements are essential in dispersing the traumatic effusion, maintaining muscle tone, preventing the formation of adhesions between the joint surfaces and between adjacent muscle layers, and accelerating the return flow of blood When to begin movement and weight-bearing in muscle and joint injuries is an important question to decide There are some who spray the injured muscle with ethyl chloride to produce local anesthesia by refrigeration, or inject novocaine into the joint to deaden pain, and then have the patient carry out the normal functions of the part involved physicians require absolute rest until all signs of inflammation subside In my experience I have found that early movements of the injured part gives the best clinical results, provided a protective bandage with adhesive tape is applied The purpose of the protective bandage is to prevent the injured part from going in the direction in which the injury occurred sprained ankle occurs most frequently when the foot is inverted The protective bandage does not restrict dorsal and plantar flexion of the ankle joint but does prevent inversion of the foot This prevents any strain of the injured tissues on the lateral surface of the ankle joint

I cannot emphasize too strongly the importance of applying the correct type of protective bandage in muscle, tendon, and ligament injuries to prevent overstretching of the injured tissue. The results of overstretching are similar to that

which occurs in a split lip Every time the pa tient laughs, the edges of the wound are pulled apart and healing is delayed There is little value in placing strips of adhesive tape around the patient's back for muscle or ligament injuries as they do not limit the movements of these All that is necessary is to anchor one end of a strip of adhesive tape in the middle of the back, carry it down over the hip joint and anchor the other end on the posterior surface of the This will prevent the pa middle of the thigh tient from bending forward or flexing the thigh and, thus, prevent overstretching of healing tissues

A realisation of the necessity of preventing overstretching of healing tissues by a protective bandage becomes increasingly important with the present trend for early ambulation of patients following operations

I have endeavored to present the application of several of the physical modalities as they are related to acute traumatic injuries of the muscles and joints. These physical agents have an even more important function in treating the disabilities resulting from traumatic injuries which produce limitations in range of motion at the joints and weakness of muscles.

The physical disabilities resulting from fractures arthritis, amputations burns burnsts peripheral nerve lesions and brain and spinal cord injuries result in limitation of motion and weakness of muscles. When definitive treatment is no longer needed physical medicino offers the best form of treatment in obtaining the maximum degree of function.

Physical Rehabilitation

Physical medicine has proved to be the most useful method in treating the majority of acute traumatic injuries and the disabilities resulting from traumatic injuries. There is however another phase of medical care in which physical medicine is playing a major role and that is physical rehabilitation.

Medical science has made rapid progress in prevention, which is the first phase of medicine, and in the diagnosis and treatment of disease which is the second phase of medical care, but has failed to maintain the same degree of progress in the third phase or rehabilitation. This has resulted in a gap between the customary end point of medical attention and the needs of many patients. We have been so engrossed in preventing and treating diseases that often the patient has been forgotten

What are the basic needs of the disabled? We have found them to be the ability (1) to walk and travel, (2) to care for their daily needs, and (3)

to have the maximum use of the hands. These are the essential requirements to meet the needs of daily living and working. No patient should be discharged from a hospital, until he has reached his maximum ability in attaining these three objectives.

Let us consider briefly our present procedures in many hospitals The surgeon amputates the The patient recovers from the operation in good condition, and the stump is all that could be desired. The surgeon is busy from morning until night in consultation, teaching, and operat ing We can hardly expect him to give the time or become interested in the slow, laborious, time-consuming third phase of medicine someone must apply the bandages to shrink the stump maintain normal motion and strength of the stump, teach the patient how to use crutches in walking, and recommend the proper type of prosthesis Many months later the patient must be taught to use his artificial leg in walking, climbing stairs, sitting down and arising from chairs, getting in and out of a bus and all the other activities necessary for daily living

A prominent surgeon had a corebral hemor rhage which resulted in a right hemiplegia. He asked his medical and surmeal friends for assist ance and they all told him he had a hemiplegia from a cerebral accident "I know that," he said, "but what can you do to help me?" His desire, like that of all hemiplegic patients was to learn how to walk, to care for his daily needs, and have the maximum use of his hands so that he could return to his practice of medicine How quickly the morale of these patients rises when they are taught to walk with a crutch or cane to lace their shoes and tie a bow with one hand out their meat with a special knife, learn left-hand writing and many other activities for self-care In Bellevue Hospital we have been successful in teaching 95 per cent of the patients referred to the Department of Physical Medicine. to walk and travel and many of the activities for daily living, and the average age of these patients is 65 years

There are over 2,000 soldiers and many times that number of civilians who have a loss of motion and sensation of the lower extremities with incontinence as a result of traumatic spinal cord lesions. By proper rehabilitation procedures every one of these patients with a dorsal or lumbar lesion can learn to travel with braces and crutches, care for their daily needs and be trained in a useful vocation if they so desire

There are thousands of individuals disabled by traumatic injuries and millions who are crippled because of congenital defects and diseases who could be rehabilitated and employed in produc tive work if we devoted as much time and effort to the third phase of medical care as we do to the first and second phase

The development of methods for the physical, mental, social, and vocational rehabilitation of the severely disabled began at the Institute for the Crippled and Disabled over twenty-eight years ago During the War, the Air Corps, Army, and Navy developed many new methods The Veterans Administration has a medical and surgical rehabilitation division formulating new procedures for rehabilitating disabled veterans A number of medical colleges and technical colleges have received grants from the Baruch Committee on Physical Medicine to study the physiclogic effects and clinical indications for physical

therapy, occupational therapy, and rehabilitation procedures in the treatment of diseases and patients and to train physicians in physical medi-

Thus, physical medicine, which is the newest and yet the oldest branch of medical practice. will, I believe, become more and more useful to physician and surgeon, not only in the treatment of traumatic injuries but in every phase of medical care

WHAT DOES THE MEDICAL SOCIETY OF THE STATE OF NEW YORK DO FOR ITS MEMBERS? Council Committee on Medical Publicity

The Council Committee on Medical Publicity directs the work of the Public Relations Bureau of the State Society The Bureau in turn handles those activities which have to do with the Society's relationship with the public. These activities range from the preparation of simple newspaper publicity to more complex activities, such as implementation of the Society's legislative program with the public, and coopera-

tion with other departments of the Society whenever public relations or publicity assistance is needed.

Under the aegis of the Medical Publicity Committee, activities of the Society are made known throughout the year in press releases sent to newspapers all over the State or in particular regions where the news is of This includes releases about postgraduate medical programs, teaching days, district branch meetings, and the proceedings and scientific program of the annual meeting — During the annual meeting a press room is set up for the convenience of the Society and the press Officers of the Society and its official bodies are assured of correct interpretation of their actions and their words, the press, on the other hand, is as-

sured of accurate information and assistance in securing it The production of booklets and pamphlets is also a function of the Bureau — From time to time printed matter has been published in connection with socialized medicine and voluntary medical insurance in order to keep the doctor posted and the public informed. In the campaigns such as those on chiropractic and antito keep the doctor posted and the public informed. In the campaigns such as those on chiropractic and antivivisection, the need for accurate and interesting printed matter for distribution to the public becomes a pressing necessity. Some of the booklets put out by the Bureau include. "Medicine Men and Men of Medicine" for the campaign against chiropractic legislation, "Dogs, Drugs and Doctors" and "His Future Is Brighter" for the educational campaign to halt proposed antivivisection legislation, "Check and Double Check on Sickness Insurance," which is a comprehensive question-and-answer booklet on socialized medicine and related subjects, published in December, 1946. In addition to these, Dwight Anderson, director of the Bureau, has prepared several books aimed at better public understanding of the profession. These are "When Doctors Are Rationed," published in 1942 by Coward-McCann and "What It Means to Be a Doctor," published in 1939 by the Society. He has also written articles on public relations for the professional and popular press.

It has been the custom of the Public Relations Bureau to produce from time to the three will be a supplied to produce from time to the profession of the Public Relations Bureau to produce from time to the public professional and popular press.

It has been the custom of the Public Relations Bureau to produce from time to time "Club Health Talk Bulletins" for the use of doctors in making club and radio talks on medical subjects Another publication is the News Letter of the Society, which goes out to a mailing list of top officials of the State Society, officials of county societies, and other interested persons A service rendered without any fanfare is frequent conferences with persons wishing information on controversial subjects, such as socialized medicine, medical care insurance and legislation, and a myriad of other questions. Sometimes these questions come by mail from high-school and college students, club people, and doctors. Queries are always given careful attention and information is supplied. A service on an even higher level is that given to magazine writers preparing articles on medical subjects Conferences are held with writers and then they are directed to proper channels for

further information and assistance

The Public Relations Bureau has pooled its resources on several occasions with that of the Legislative Bureau in putting on an intensive campaign against undesirable legislation Most outstanding was that against proposed antivivisection legislation last winter. In that instance, the Bureau marshaled all its forces and facilities in a bang-up campaign involving the formation of an organization called "Friends of Medical Research" Large quantities of educational printed matter were prepared and circulated on the subject, arousing the people of the State of educational printed matter within a month after the introduction of the bill the battle was over and the antivivisectionists defeated

Cooperation has been given to other departments of the Society in need of the kind of service available from the Bureau Assistance has also been provided the Woman's Auxiliary in formulating and conducting

a worth-while year-round program

PHYSICAL THERAPY IN THE TREATMENT OF ARTHRITIS

L MAXWELL LOCKIE M D, and EARNSCHIFE MUSGROVE, A R P T T, * Buffalo, New York

(From the University of Buffalo School of Medicine, and the Buffalo General Hospital)

URING recent years many advances have been made in the treatment of arthritis This is due to a better understanding and a more accurate diagnosis of the various types of arthri tis There is an official classification which has been approved by the American Rheumatism Association. It is our opinion that physical therapy plays an important role The management is based on a carefully planned program of therapeutic procedures adapted to the course of the disease and its success depends upon close attention to the individual's needs rather than upon the use of elaborate equipment and appara tus.

Patients with rheumatoid or severe osteoar thritis are usually hospitalized from two to four weeks in order to initiate a program of treatment in which medical therapy is combined with physi-The physical therapist must work cal therapy in close cooperation with the attending physician and successful results are dependent upon their cooperation

Approach to Treatment

The treatment of these patients must include a combination of psychologic and physical methods

Psychologic Treatment -In order to propere the patient psychologically for physical treatment, the physician and the physical thera pist must understand him and constantly encourage him In turn, the patient must be made receptive He must understand the purpose of the treatment, the details involved and the necessity of following all suggestions with minute care. Maximum benefit can be derived only through the patient's mental and physical cooperation sustained and encouraged by the expectation of improvement

2 Physical Treatment

(a) Bed Rest .- For effective treatment bed rest The bed should receive criti must be adequate cal attention. It must be hard, flat, and easily accessible from both sides Boards placed between the mattress and springs assure a firm and unsagging bed There should be space between the bottom of the mattress and a padded foot board or pillow This footboard must be high

enough to support the weight of the bed clothes One pillow is permitted under the head pillows are used under the knees, as flexion contractures of the knees develop easily

The patient lies in a supine position in good alignment, with arms in the rest position, parallel to the body. The feet are supported against the padded footboard or pillow, and the heels are dropped over the edge of the mattress flat sandbags are sometimes used to maintain extension of wrists and fingers. Larger sandbags prevent outward rotation of the hips Frequent changes of posture for short periods are indicated for the comfort of the patient, and to prevent the adverse results of inactivity and pressure from the bed Instruction is given in some of the fundamentals of the technic of relaxation, as the pain and discomfort diminish

A special course of breathing exercises is planned and done regularly throughout the day This includes deep breathing with chest raising inhaling through the nose, and exhaling through the mouth, diaphragmatic breathing with chest raising during inhalation and pulling in of abdominal muscles during exhalation, and abdom anal breathing with chest raising back flattening and lower abdominal muscles contracting

The following breathing exercises, and some simple trunk exercises are also taught flattening accomplished by pulling the anterior pelvis up and the posterior pelvis down to decrease lordosis adduction of scapulae by con tracting the rhomboids with relaxation of the humerus gluteal setting by tensing the buttocks and quadriceps setting

A sitting position with knees extended one-half hour three times a day, at meal time, is routinely adhered to Bed exercises must be carefully timed and must alternate with periods of rest vent intique, instructions are given to exercise every hour on the hour during the day vised practice is continued and muscular tonus lessens as progress is made toward the relaxation of body and mind

(b) Heat -This is essential in the treatment of arthritis. Mild and even heat is applied to all painful areas. This mild form of heat dilates the vascular channels and softens the tissues in preparation for massage and exercise. It also brings relaxation and relief from pain attention is given to the method of application of this mild heat, at no time is it intense. During

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Symposium on Physical Medicine in "Human Reconversion Section on Physical Medicine in "Human Reconversion Medicine, May 1, 1946. By Invitation.

the treatment, the comfort of the patient is considered, and changes in posture and occasional use of pillows for support are helpful

Infrared has proved a satisfactory source of Simple lamps are available for both hosheat pital and home use It is extremely important that the heat be only warm, never hot wave diathermy, which heats the deeper tissues, is an effective form of heat and is prescribed for the spine, the large joints, and frequently for the Diathermy is administered with low intensity and the technic selected should depend upon the comfort of the patient The paraffin bath is a satisfactory method of applying heat to the hands It is a simple procedure for home Hot packs, if carefully applied, as outline l below, bring comfort and relaxation to the patient turkish towel packs, wrung out of water at 115 F are wrapped around painful tissues and are covered with a light dry blanket, the packs should be changed every five minutes Steaming is achieved by using hot wet towels covered with half-filled hot water bottles applied for twenty to thirty minutes A Hubbard Tank, if available, is valuable as all joints may be treated simultaneously With the force of gravity eliminated, active exercises are performed with a minimum of discomfort

Note Ultraviolet light in mild tonic doses gives the patient a feeling of well-being Whirlpool is contraindicated in the treatment of patients with rheumatoid or osteoarthritis

- (c) Massage,—Of the quartet of rest, heat, massage, and exercise, massage is of value only when performed with technical skill plication of massage should follow heat and precede exercise, guarding at all times against exhaustion The main purpose of massage in arthritis is to increase the blood supply to the joints. Since its effective application depends upon relaxation, massage should consist of effleurage which is a very light, gentle, rhythmic stroking movement, molding the hand to fit the contour This is followed by light, firm, continuous stroking performed centripetally Petrissage movements, consisting principally of slow, gentle, rhythmic kneading, may be applied to the tissues proximal and distal to the joint, but never over the joint itself The patient will both enjoy and benefit from carefully administered massage
- (d) Exercise —Exercises are chosen with discrimination, performed slowly, and rhythmically Since pain increases muscle spasm and defeats the purpose of the exercise, progressive motion with minimum muscle effort is desired and substitution is allowed. The patient is given instruction and should understand the purpose of the exercise program which is graded in duration and is always within the patient's capacity. It is

varied to prevent monotony Muscle re-education deals with the treatment of weak muscles and the muscle atrophy of disuse is corrected Each joint is put through a normal range of motion once each day if possible The correct position and the proper support must be insured, due to the difficulty of obtaining relaxation and the pain encountered Therefore, this procedure may take considerable time

Restoration of function is obtained by developing power in the joint. Individual joint exercises begin with the small joints and continue with the larger ones

Passive exercises are performed by the operator without assistance from the patient, and are usually in preparation for active motion. Assistive active exercises are performed by the patient with the assistance of the operator. Carefully performed exercises require concentration. Active exercises are performed by the patient under supervision, but without assistance, and are valuable in restoring normal function.

(e) Occupational and Recreational Therapy—In this plan, occupational and recreational therapy are important. Treatment should be under the supervision of a qualified occupational therapist to whom the physician has given the necessary instructions in each individual case. Here, too cooperation is extremely important between the physician and occupational therapist.

Occupational therapy provides the needed diversion for the inactive patient and helps in the restoration of function. It also substitutes for the patient's own attempts at activity, which may be harmful. The treatment starts at the bedside, continues during convalescence, and at home progresses into work therapy to orient the patient into old or new work habits.

(f) Convalescence —Posture, the ability to maintain proper balance, is now of the greatest importance. The patient learns the use of his body as a whole and appreciates the relationship of posture to health. He is confident and stimulated when motion is under his control.

The program of bed rest and organized evercise is continued preparatory to weight bearing Special attention is given to foot exercises which are simple and must be performed carefully and systematically Consideration is given to shoes which must be well supported, must fit properly, and be worn from the initiation of the weight-bearing exercises. At this stage any necessary supports, such as parallel bars, crutches and walker, may be used, but these devices are only temporary and used in the interim between complete bed rest and restored function

In the transition from bed rest to sitting, standing, and walking, body alignment is stressed and

fatigue must be minimized. Preliminary exercises are continued alming at postural stability in the sitting position before standing or walking is attempted. The exercises have strengthened the patient so that he may sit over the edge of the bed or in a suitable chair maintaining good posture. With added strength and confidence he stands well supported with weight evenly distributed and equally placed on the ball of the foot and the heel for balance. His abdomen is drawn in, his chest raised and his head stretched toward the ceiling. He practices transferring the weight from one foot to the other.

Walking may require the support of crutches or a walker, but, if at all possible, these supports are disregarded since the patient tends to concentrate his weight on his hands when using supports, thus impairing his balance He is encour aged to take short steps, keeping his knees fairly straight, and putting his whole weight on his feet During his first attempts at walking, the patient receives some support but it must be given without disturbing the all important bal If the patient has been consistently encouraged and reassured, and has acquired con fidence in the procedure, he accepts the discomfort and wearmess which accompany the first steps He looks forward to the goal of a normal mit

(g) Home Therapy—The factor of the patents home adjustment is emphasized in this program. His mental repose and muscular relaxation continue to receive constant attention. The patient becomes posture-conscious and derives pleasure from his exercise regimen. He is kept busy and interested during his convalescence and now approaches the objective of car-

ing for himself and assuming old habits modified to suit his new routine

While the patient was in the hospital, plans have been made for the management of his care and treatment at home Some member of his family. who has followed the program and realises its importance is given instructions. Rest, heat and exercise in their simplest form are continued at home, and there rest must still be adequate definite number of hours are spent in bed fatigue is apparent, a longer time in bed is indi cated Heat by means of an infrared lamp is applied regularly, two or three times daily The heat must be mild and the distance at which the lamp is used should be considered (30 to 36 inches) Exercise is still of great benefit and. now, also takes the place of massage. The routine is worked out to suit the new environment. General postural and breathing exercises are continued and individual joint exercises performed at regular intervals. Activity is increased gradually with care to avoid fatigue of stairs is avoided for some time. Occupational therapy solves much of the problem in regulating activity

Progress must be carefully followed by the physician, physical therapist, and occupational therapist, and changes in the program must be made according to the degree of improvement.

In conclusion, patients with rheumatoid arthritis and osteoarthritis show the greatest improvement if a specific program adapted to their individual needs can be carried out intensively, and can be continued at home. It is of extreme importance in the successful management of the case to be sure that the patient has a good under standing of the whole program of his treatment.

INDUSTRIAL HEALTH MEETINGS

A conclave of combined professional personnel in industrial health work over the entire nation will take place at the Hotel Statler, Buffalo New York April 26 through May 4 1947 These meetings will represent the 32nd annual

These meetings will represent the 32nd annual gathering of the American Association of Industrial Physicians and Surgeons the 9th annual conference of the American Conference of Governmental Industrial Hygienia Association the American Industrial Hygiene Association to the American Conference of the American Association of Industrial Nurses, and the 4th annual meeting of the American Association of Industrial Dentists.

The sessions will be replete with many new subjects of interest including among others, round table discussions for chemists engineers, physicians and nurses a symposium on new problems in the developments of industrial hygiene a discussion of state codes and industrial hygiene administration conference on environmental control on particle size, and analytical procedures, clinics on fractures are transmitted to the use of the atomic bomb, reports on the Bildin experiments with notion pictures tracer chemistry in toxicologic

research and experience with range finding tests, progress in the teaching of industrial medicine in American medical schools, the development and administration of industrial dental clinics in various industrial groups, a penel discussion on new preven tive measures in industry a panel duscussion on in inservice education of the nurse in industry, and many other subjects which can be found by consulting the preliminary program

Prominent speakers on important subjects will

Prominent speakers on important subjects will be featured at dinner sessions, including other events such as the Cummings Memorial Lecture and the presentation of the Knudsen Award for the Most Outstanding Contribution to Industrial Medicine

during the past year.
Also available at this meeting will be the opportunity to inspect and study a splendid group of scientific and technical exhibits, with the most recont developments and medical department accessors.

Romes.

Further details and a copy of the preliminary program may be secured by writing to Dr Edward C Holmblad Managing Director of the American Association of Industrial Physicians and Surgeons, 28 East Jackson Blvd. Chicago 4, Illinois.

THE PLACE OF PHYSICAL MEDICINE IN THE TREATMENT OF PATIENTS WITH MENTAL CONDITIONS

Benjamin Simon, MD, Middletown, Connecticut*

BECAUSE of the limited time available and because of the very special conditions under which the work I am presenting was performed, it will be necessary to define and establish the framework of this discussion, lest it appear unduly simple, naive, and, possibly, banal

The term, "mental condition," will include all emotional and mental reactions found in the patients coming to Mason General Hospital, Brentwood, New York, in the period of over two and one-half years during which I was chief of neuropsychiatry Approximately half of the patients were psychotic, most of the others had psychoneurotic diagnoses A fairly small number were psychopathic personalities or had various neurologic disorders which, because of errors in initial diagnosis, led to their hospitalization in a psychiatric hospital Actually, the distinction I am making is of no serious import. By the time an accurate diagnosis could be made, for what it was worth, the treatment of the patient would have The basic and essential been much delayed criterion was a general estimation of the neuropsychiatric patient as a member of a group, and the special features of dynamic reaction which characterized the individual under consideration Certain other factors had to be taken into account

I will not detail the special functional scope of the neuropsychiatric hospital This I have covered in the recent section on the treatment of the neuropsychiatric patient in an Army hospital which appeared in Medical Clinics of North America 1 In brief, the basic program of treatment was promulgated on the thesis that maximum benefit of hospital care would be achieved within a definable period of time, this period being that within which a great percentage of patients would achieve recovery Actually, this period of time comprised approximately eight to ten weeks of hospitalization at Mason General Hospital, and did not include prior hospitalizations in overseas installations Physical medicine was not considered as such in the treatment of the patient except as a technic for which there was particular aptitude in interested hands, and as a means of doing certain things for and with the patient, which helped him to improvement or recovery The total theory of treatment was postulated on a somewhat naive simplification of the fundamental dynamics underlying mental and emotional reaction patterns To quote from the afore-mentioned article

"For working purposes, we may accept the fact that both mental and emotional disorders are intrapsychic therapeutic efforts. Inefficient as they may be from the viewpoint of social adjustment, they act to prevent the complete emergence of an underlying disturbance which, if allowed full expression, would be considerably more painful than the explicit symptoms. In other words, symptoms of a psychiatric disorder represent an effort to reduce unbearable anxiety.

"This simplified concept of functional symptoms would lead to the conclusion that the external effect of symptoms must necessarily lead to an improved condition in the individual Intrapsychically, this is probably true. To the observer, who sees the effect of symptoms only in the relationship of the patient to his environment and the performance of said patient within a postulated framework of behavior, conation, and cognition, the effect of the symptoms, if they do reduce anxiety, is not at all a restoration of the patient to a community of interest with the world, but, on the contrary, a separation of this individual from the world, in which without obvious or discernible disturbances in his physiologic or physical economy he appears to differ from other men, to perceive differently, to feel differently, to act differently—to be different In summation, the symptoms have served the function of isolating the individual from others by the imposition of an involuntary, unrecognized, and inefficient autotherapeutic process "1

Physical methods then became part of the total program directed at the simple object of freeing the patient from his self-imposed isolation—as did group therapy, occupational therapy, hypnosis, narcosynthesis, etc

In ascending order of importance, our special physical therapeutic technics fell into three groups. The first is in most hospitals recognized as "physical therapy" and is performed by or under the supervision of trained physical therapists. In general, it is directed at specific physical disorders and I will mention only in passing the treatment of these physical conditions in neuropsychiatric patients. A priori, any improvement in the physical status of the patient necessarily reflects in his mental and emotional state. No amount of psychotherapy can be fully effective on patients who have old fractures, arthritis, bursitis, myositis, sacrollac strains, sinusitis, and other such conditions. In such

^{*}Presented, by invitation, at the 140th Annual Meeting of the Medical Society of the State of New York Symposium on Physical Medicine in "Human Reconversion, Section on Physical Medicine, May 1, 1946

cases the use of diathermy was very effective These conditions involving murcles and joints were followed up with graduated passive to active exercise on the plinth and then on to more active exercises in the reconditioning gymnasium equipped with a rowing machine bicycle pullevs, stall bars, weights, parallel bars and above all, competent, trained instructors duced in addition a great sense of well-being in the patients Not the least advantage from this work was the group effect, and this was seen particularly in the officer group, who would go to the gymnasium and engage in what might seem to be a drab and uninteresting series of exercises competing with each other on the daily progress of their exercises. When one recognizes the essentials active in neuropsychiatric disorders one sees narcussistic gratification on the one hand but also a healthy trend toward object identifi cation with the others - a first step in overcoming the self-imposed isolation

Ultraviolet rays were most beneficial in the treatment of many skin diseases particularly acae, and helped reduce inferiority feelings in these patients. The added rapport with the medical officer thus attained helped facilitate

other therapies as well

The direct treatment of the symptoms of con version hysteria has heretofore not been satis-With hypnosis, suggestion under seda tion manipulation under anesthetic and other technics, it is quite possible to cure the hysterical patient of his presenting symptoms. The usual outcome is a reinstitution of symptoms or more commonly the institution of new conversion manifestations. Worse than either is the emergence of the underlying anxiety without expression in conversion symptoms at all treatment which does this is detrimental from the long range point of view We found, however, that it was quite feasible to treat conversion symptoms, if, at the same time, treatment was directed at the correction of the total personality reaction and at the elucidation and abreaction of the dynamic conflicts underlying the symptoms. In these instances, no harm was done by clearing up symptoms and securing from this a heightened transference on the part of the patient-which helped again in facilitating psychotherapeutic treatment by individual and group methods. Many cases of conversion hysteria were treated with heat massage, galvanio or faradic stimulation, and local exercise effect of electric stimulation in paralytic cases was quite excellent. The patient who could not walk had his psychotherapy supplemented by the physical attention and its results. This fed his narcussism at first but at the same time, led to improved transference and served to reduce the same narcissism. When all the elements of treatment went along pair passu, results were most gratifying. The idea of being "built up" physically possessed many neuropsychiatric patients and attention to this without avoidance or overfixation enhanced greatly their total response.

The second application of physical methods to the treatment of nouropsychiatric patients was carried out in the hydrotherapy department will dismiss so-called stimulation forms of therapy with just the word that they were not used knowledge of the dynamics involved in depressions and in catatonias indicates to us that ef forts to "kick the patient into a cheerful state" are fundamentally unsound. We believe that these reactions have underlying them the very same mefficient autotherapeutic trends as do the behavior of the manias and other excitement states—that, while they are polar opposites in manner of expression, they are similar in that they are attempts to deal with a world which the patient is finding too much for him pact of this world should be reduced to a mini mum until the personality has been brought to a state where it may, so to speak, "take it" There is a place for some of the stimulation therapies in mild psychoneuroses, but this stimulation is achieved much better in the total program. For sleep disturbances, particularly those having trouble getting to sleep, but sleeping well afterward, a few hours in the continuous baths at bedtime is very beneficial Our limitations in equipment the great need of equipment for the more intensely ill patients and other rea sons—the marked deficiency in personnel, both qualitatively and quantitatively, barred any ex tensive use or application in this direction. This was true also of the salt glow

Our hydrotherapy was based essentially on the continuous bath and the cold wet sheet pack. The continuous bath, with standard apparatus consists of immersion of the patient in water at an average temperature of 96 F., a state resem bling as nearly as possible the omnipotent and stimulation free existence of the intrauterine Whether or not this was the total effect on the psychology of the patients I do not know We found this treatment extremely effective in both excited and depressed patients, and it was not uncommon for patients to ask for both or pack when they felt their anxiety coming to open expression in one direction or the other ments in general, continued through a twelvehour period, in some instances for a twenty four hour period, and were usually organized as courses of treatment extending over a number of days, or for several weeks. During the year and a half period in 1944 and in 1945, 13,000 continuous

baths were given In 1945 alone, we gave 10,000 During the last half year of 1943, and an equal part of 1944, the hydrotherapy unit was not in operation and could not be used this period, the cold wet sheet pack was our mainstay, and 7,800 treatments were given The number of packs dropped from 7,000 in 1944 to 4,000 in 1945, with a corresponding increase from 3,000 continuous baths to 10,000, showing In all, 25,000 treatments with our preference continuous baths or cold wet sheet packs were given to 4,000 patients during the two and onehalf years from the opening of the Mason General Hospital to my departure Without this, we would have been totally at a loss to care for many disturbed and depressed conditions In many cases, promptly after admission the patients received continuous baths or wet sheet packs, and very quickly the disturbance subsided and the patient became accessible to other forms of treatment Many of them had this while they were being worked up for shock therapy, and in many instances, hydrotherapy along with shock therapy carried the patient over the acute stages of his disorder while the effect of shock therapy was coming into play Between treatment periods, every effort was made to get as much participation as possible in the rest of the program

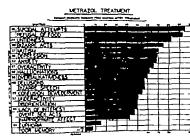

The last form of treatment which I shall discuss is not particularly classified under the heading of physical medicine, though its effect is produced through a physical means—the induction of a convulsion by the passage of an electric current through the brain This form of treatment for our neuropsychiatric casualties, particularly the acute psychoses, was pre-eminent and when cases were properly selected was the most effective technic applied to the individual The development of the treatment can be seen by the following In 1943, 1,000 electroshock treatments were given to 70 patients, exclusive of an approximately equal number of cases treated by metrazol before electric equip-In 1944, 1,250 patients ment was received had 8,500 treatments, and in 1945, 1,500 patients received 20,000 treatments The total of all the cases treated by shock therapy was approximately 3,000 during this two and one-half year period They received 30,000 treatments Despite these figures, by no means all cases who might have benefited by the therapy received it, since the use of this treatment in other than psychoses was prohibited by Army regulations, though it is effective in some neurotic states

Like our other special methods of treatment, physical or otherwise, shock therapy was considered only a means to an end—a method of facilitating the patient's introduction into the

broad program of general reconditioning point of view in selecting cases for treatment rather antedated that of the general program but fitted into it most admirably Semantic and nosologic considerations were abandoned, the only exception being that it was necessary to determine from the total reaction whether or not a The patient was given patient was psychotic shock therapy, not because he had schizophrenia, manic-depression, or some other psychosis, but because of the special symptoms which he presented and which we felt could be ameliorated by shock therapy The basic criteria were established from the data of cases treated by met-At the Mason General Hospital, these criteria were widely applied and found to be as effective in cases treated by electroshock therapy The Army material has not yet been sufficiently worked up for presentation, so I shall present the considerations which Holt and I² postulated Twenty common, readily definable symptoms were studied, and the effect of shock therapy on each was reviewed at the end of a course of treatment, and a year or more later It was found that effective results required a minimum course of treatment, averaging sixteen convulsions quote again from my article on treatment,

"Shock therapy, like the other forms of treatment, is directed at the symptomatic expression of the patient and cases are no longer selected according to diagnostic categories The general criteria of reactivity, acuteness of onset, relation to reality problems, all of which are well recognized as indicating a good prognosis, are generally found in Army patients In addition, the criteria established by Simon and Holt are used as a guide for the selection of cases Certain symptoms such as refusal of food, confusion and bewilderment, disorientation, depression, and mutism indicate a good prognosis for electrotherapy Others, such as mappropriate affect, bizarre speech, euphoria, and underactivity, are less responsive Secondary projections respond well, primary projections do not Selection of patients by these criteria has led to outstanding success Of paramount importance is the necessity of instituting treatment early Many patients will be under electrotherapy within a matter of forty-eight Treatment must be thorough and complete Great danger lies in terminating treatment at the critical point of about the sixth treatment, when the patient appears to be markedly improved-and usually is Termination of treatment at this point will result in frequent relapses and many failures In general, treatment should be carried on until the patient shows no further changes in reaction for the better or the worse Treatments will range from twelve to sixteen "1

The convulsion is considered an absolutely necessary part of the treatment So-called sub-

Fra 1

Fro. 2

convulsive, absence or petit mal types of reaction had no place in our therapeutic program

Fig 1 shows the response of these symptoms at the end of an average course. You will note that the desire to die disappears and that shock therapy is a most excellent appearing. The patient regains interest in his appearance. He stops behaving in a queer manner and begins to talk. His mood lifts. At the other end of the scale the malignant characteristics such as suphorm mappropriate affect, overt sexual behavior lack of interest, respond much less favorably. Poor memory is, of course, a consequence of treatment and should not be considered except on this basis unless it is a primary manifestation of per plexity.

Fig 2 gives us the status of the same patients at least one year, and in many instances two years, after the termination of the course of treatment. You will notice that improvement is generally retained. Actually, in the Army I never saw a feeding problem remain such after the second or third shock treatment. Some soldiers were even returned to duty after a course of treatment, and many were restored to their homes and families without necessity of further hospital care.

In conclusion, I quote again

"In all cases whether the soldier is to be returned to duty or not, treatment has included plans for the future. The social worker will have worked out problems of special importance to each individual in making his restoration to the community more successful. He will advise the patient of community resources which he can tap not generally but specifically in relation to his own community. If the psychiatrist feels that further outpatient treatment is desirable he will refer the patient to the particular agency in his community equipped to perform this function. Psychologists will perform vocational aptitude and other tests designed to help the patient in choice of new vocations or restoration to old. The Separation Department will have as-

sisted the patient in making out all claims for pen sions and benefits to which he might be entitled The United States Employment Service and Civil Service will have helped in job selection and placement. Separation counsellors legal assistance officers and others have paved the way for a full restoration to civil life It is important at this point, however that the patient, now brought to a level of community functioning, be kept self reliant and he prevented from developing a sense of dependence which could readily arise out of so much guidance A most dangerous consequence of the social guidance of the patient may be the tendency to make him overdependent on external agencies and dependent on his military rights and benefits.

It cannot be overemphasized that the period of treatment in the military hospital is a period of reconversion and until he leaves the hospital and returns to the community the patient is not yet a civilian.

It must also be reiterated that the hospital is performing an intermediate task in the reconversion of the patient, a task which the community must take up the day he leaves. In most instances, he will be well enough to carry his own responsibilities, but where he is not, the attitude of blaming the Army is unreasonable and unjust, since the Army is performing one phase of the total job of the successful pursuit of the war and the return to peace. Nothing which has happened can be considered to have changed this individual any more than he would have been changed by the process of living and maturation. Unless he receives full opportunity on a level with his peers, the fruits of all the labor which has gone into his restoration will be lost.

It is the duty of all those whom this former soldier will meet and know to see him as he actually is—
a man who has been away and has come back. He should be welcome '

COMMENTS ON ARMY RADIOLOGY IN WORLD WAR II

EDWARD K REID, MD, Rome, New York

WHEN I received the invitation to discuss with you the problems of radiology in the Army, I felt that perhaps the subject might be considered untimely as we were all war weary, but since that time, many matters have come up which make us think twice before we can say that military radiology is an obsolete subject Furthermore, in reviewing the material available, it became apparent that many matters of interest to civilian roentgenologists could be profitably discussed at the end of hostilities

We come before you today approaching the subject from several angles. On my part, I must give a "reporter's report to the profession" as my own professional service as chief of roent-genology was short. However, I did have the privilege of seeing radiology as others see us in my capacity as commanding officer of a general hospital and as chief of operations for the island surgeon's office on Okinawa. As far as the actual departmental problems are concerned, I am going to rely on other colleagues to tell you their experiences under varied theater conditions, and I will confine myself, as a sort of moderator, to a rapid review of the over-all problems which concern us as individuals and the Army as a whole

I feel sure that you are interested in the question of what changes in civilian personnel we may be able to expect in our specialty as a result of this war. The following notes may help to obtain this picture

Due to the foresight of the Surgeon General, Col W W McCaw, and Col A. A. de Lorimier, two outstanding Army radiologists, we made a survey at the time of the bombing of the Panay in 1937, finding the startling condition that there were ten diplomates of the American Board of Radiology in the Regular Army, forty-four in the Organized Reserve, and four in the National Guard, a total of fifty-eight possibly qualified radiologists in the event of military emergency

It was obvious that this number would be reduced by age and physical incapacity for active duty

Unfortunately, little could be done constructively because of the tenor of the times. However, an over-all plan was contemplated which consisted of these phases. (a) estimates of personnel needed, (b) plans for a curriculum for training physicians for wartime roentgenology, and for gearing the department of roentgenology.

Presented at the 140th Annual Meeting of the Medical Society of the State of New York Section on Radiology May 3, 1946

of the Army Medical School to carry the load, (c) an over-all plan for procurement of equipment and revision of tables of equipment, (d) actual development of a practical, easily operated, accurate field equipment which could be operated under almost any condition in the world in a reasonably efficient manner, this equipment to contain any easy but effective method of foreign body localization in which speed of operation was of great importance

With the advent of the state of emergency proclaimed by the President, a nucleus of personnel was available from those already in the reserve components of the Army, and with the onset of hostilities, the War Manpower Commission through its Procurement and Assignment Service, made available to the armed forces the services of an adequate number of physicians However, the problem of obtaining radiologists was still a severe one as they were nearly all of one of the following three groups (a) overage, (b) not available due to civilian needs, or (c) already volunteers in affiliated units or otherwise The matter of availability was strictly a civilian problem, usually in the hands of the Preparedness Committee of the county societies the radiologist was declared available, the medical officer's Recruiting Boards offered him a The radiologists as a whole were commission fortunate in that nearly all started as majors and many were advanced to heutenant colonels in a short time

It seems only fair to make the comment here that the rank held by a radiologist should not necessarily be taken as an index of his professional ability This was stressed by the Surgeon General's Office when I was discussing these matters They were regretful that in many instances, especially in the continental limits of the United States, promotions were not always possible The matter of promotion here rested solely with the Commanding General of the Service Com-He was given a blanket number of grades for all branches, and, often, being a line officer, did not see eye to eye with the medical component in regard to relative rank and, consequently, some were passed by though deserving

The Surgeon General's Office wished me to pay special tribute to the many splendid radiologists who were ordered to remain in induction station service. It was recognized that many were passed up for promotion even though doing a work which was tedious in the extreme when they would rather be in units destined for action

There was, however, no choice as the competent work done has already been felt in less sustain able claims than would otherwise have been the

Upon receiving the radiologist into the service they were classified on their education and expenence into four groups

- A Professors of radiology or similar experience
- B Diplomates of the American Board
- C Residents in radiology or men of expanence in civil life over a considerable time but not diplomates
- D Graduates of the short course at Army school or those with little experience in civil life, but with special interest and adaptability

It may be of interest to know the peak figures in these classes as shown by the records of the Surgeon General's Office, as this will give an indication of the number of men released from the Army who probably will be interested in pursuing the specialty. This will apply particularly classes C and D, as those above that are already certified. The peak was reached in April of 1945, and has been declining since then. At that time, there were four in class A—these were used as consultants, 414 in class B, 230 in class C, and 677 in class D—a total of 1,334. A few of these, particularly the regulars, were not on professional duty

Since a large number of these men will be returning to civil life and many will become assocated with avalian roentgenologists, either as readents or junior associates, I felt you would like to know what the training of these men in the Army embodied.

As in all officer personnel, it was the desire of the Surgeon General's Office to give basic military medical training at Carlisle Barracks and a short tour of duty to familiarize them with army life where possible. Following this, those who were trained early in the war went to a four weeks "Intensive Basic Course in Roentgenology" at the Army Medical School Washington, DC The stated objective of this course is the key to the desires of the Surgeon General. I quote "The purpose of the Intensive Basic Course in roentgenology is to prepare junior officers of the medical corps to operate the x-ray equipment of the Army installations in such a manner as to prevent injuries to patients or undue strain on equipment. It is not intended to make ex pert roentgenologists." The organization of this course was divided into the following sections (a) field equipment (b) photoroentgenology (c) permanent installation equipment, and (d) clinic work at Walter Reed General Hospital The method of instruction embodied conferences lectures, demonstrations, and practical appli cation.

Later, this school was moved to Memphis, Tennessee, where twelve weeks of work were given. Of course, a considerable time was allotted to military subjects in this as in every other army school, but the following time was spent on technical reentgenology

Physics X by Hisands Rosengengraphy Fluorescopy Sitroscopy Maintenance of Equipment Foreign Body Localization Diagnostic Rosengraphy Fathologic Conferences Cluical Conferences Field Rosengers Responsibility	Houn 57 23 38 5 5 23 24 24 210 36 36
	30 3 2 30

In addition, a more clinical course was given to especially adapted students at the Mayo Clinic for a twelve-week period

It seems fairly certain that many of you are receiving applications from both men and women technicians who have been demobilized and I believe you may be interested to know what you may expect from them. Schools for technicians were set up in centers throughout the country and v-ray was but one of many subjects taught. The exact number of technicians who finally were graduated has not been compiled but it is fair to estimate that about one technician was needed for 100 hospital beds since a 1,000-bed hospital had ten. The technician received the following roentgenologic technical training

	Hour

Personnel having been procured and trained. the problem of assignment arose. This again brings out the point that rank can be a matter of being at the right place at the right time, as there must be a position vacancy before any one can be recommended for advancement. It would seem, however, that the Army did well by the radiologist. In the A and B classes there were 418 men, the plan called for 318 numbered gen eral hospitals whose chiefs were to be lieutenant colonels. This would leave only 100 men to fill the vacancies of the large hospitals in the United States consultants training directors and those not engaged in actual radiologic work. It was therefore largely the younger men in the C and D classes who held the rank of captain the policy to promote all Medical Corns officers

from first heutenant to captain after six months in grade. Some of the Zone of Interior installations did not get the promotions from captain to major which would have been desirable. When we consider that the chief of anesthesia of a 1,000-bed hospital was a captain, radiology must admit that it had friends at court in Colonel Kirklin and the others in the Surgeon General's Office

Having discussed the history and personnel problems, perhaps just a word regarding the type of service to be rendered would be of interest. This was almost entirely diagnostic roentgenology. Some superficial therapy was possible with the field unit, but was not especially encouraged in mobile installations. Deep x-ray and radium therapy were only permitted in specifically designated centers. Photoroentgenology was, of course, performed at induction and separation centers.

There is no time for me even to begin on the subject of the pathology encountered — In this I hope the other essayists will have cases of interest and I will only refer to the splendid paper of Drs J C Bell and G W Heublein in the November, 1944, issue of Radiology entitled "Diagnostic Roentgenology in an Army Hospital During the Present War"

Our equipment procurement problems were not acute once the war was under way except for the problems of transportation. The right materials to do the job had been adequately planned

Maintenance was another matter In the desert, the problem was that of excessive dry heat, lack of adequate water, and sand contamination. In the arctic, it amounted to an engineering problem of heat for the department as a whole

The American Board has been most thoughtful of the younger men called into service Provisions were made for them to obtain credentials from each diplomate who supervised their training

These credentials were authenticated by the commanding officer of the unit. The service will be evaluated by the Board when considering eligibility for examination and, thus, the time will not be lost

It has also been a source of satisfaction to younger radiologists to know all the thought and effort that was given by those at home to the problem of refresher courses and residency training. The majority of these men realize that further work will be necessary before certification.

Many radiologists can well consider the services and Veterans' Bureau as careers. To date, only 50 grade-B men have applied in all specialties for Regular Army commissions. With the Veterans' Bureau giving pay credit for qualified specialists, it now may become an attractive position.

In addition to experience gained in actual radiology in the Army, it is hoped that many have learned things which may be applied to our work which are actually not originally planned for such use

We are now developing a method of fluoroscopic training based on the Air Corps method of split-second recognition of combat plane formations as was taught by Dr Renshaw of Ohio State University We believe that this method will train us so that the exposure time for patients will be materially reduced without any sacrifice of accuracy of diagnosis We hope to have publication of this in a short time

BAUER APPOINTED TO HEALTH COUNCIL

Gov Thomas E Dewey has appointed Dr Louis Bauer, of Hempstead, to the Public Health Council and reappointed Homer Folks, of Yonkers, to a full six-year term

Dr Bauer will complete the unexpired term, until next January 1, of the late Dr Simon Flexner, of New York city

FOUNDATION ANNOUNCES PRIZE CONTEST

The American Association of Obstetricians, Gynecologists and Abdominal Surgeons announces a Foundation Prize Contest

PEDIATRIC APPROACH TO THE MANAGEMENT OF ASTHMA IN CHILDHOOD

BRET RATNER M D New York City

(From the Department of Pediatrics New 1 ork University College of Medicine)

GREAT deal is known today about the A management of asthma Some of this in formation can be utilized without benefit of elaborate skin tests and other studies. It is my hope that the overwhelming majority of childhood asthma cases will be taken care of by the Only in the event that the child pediatrician does not respond to such treatment should it be necessary to call upon the highly trained pedi atricallergist for assistance in diagnosis and treatment

Certain Phases of Pathogenesis

Orientation of the basic mechanism underlying allergy is needed more today than ever before There is little that can be found in the literature to contradict the antigen antibody hypothesis namely, that hypersensitive reactions in various tissues result from an interaction of circulating foreign antigen with its specific antibody the antibodies having become fixed to tissue cells at some time prior to the reaction

Whether released histamine is the direct cause or the result of the reaction is problematic 1 Yet, the proponents of the histamine theory only tacitly accept the antigen antibody mechanism and promptly unfold all the wonders of released histamine, making this chemical appear to be of major importance in the causation of the allernic reaction.2 All of their therapeutic efforts are directed toward the neutralization of histamine The drugs recommended for this purpose at best afford only symptomatic relief, and none of them Epinephrine, ephedrine, and atropine still remain as reliable drugs for the relief of aller gic symptoms This is so because they do relax the spasms which result from antigen-antibody interaction.

There is an insistent demand for ways and means to reduce the number of attacks and more particularly, to prevent attacks I lose all pa tience with the attempts at treatment of asthma with aerosol penicillin I have the greatest ad miration for this product in respiratory infections, and when infection is the cause of asthma, I use it either by apray orally or by injection But it is foolhardy to use it in a case of food environmental or police asthma With the newer

antihistaminic drugs, all one can say is that their introduction into the domain of the therapy of asthma is quite unsound I refer more particu larly to histaminase Hapamine, benadryl and pyribenzamine The first two drugs are dying a natural death for they have failed, but benadryl and pyribensamine just made their ap-That these drugs alleviate urticaria and hay fever is agreed upon by many. they alleviate asthma is agreed upon by few We should not be content with measures that

merely allay symptoms

In a previous paper³ I went into a detailed analysis of the onset of allergy in childhood showed that asthma may have its onset at any time however, very few cases appear to start in the first year The largest number of children date their first definite symptoms of true asthmatic dyspnea from the third to the eighth years This may be and usually is, preceded by multiple attacks of respiratory difficulties, repeated epi sodes of sneezing coughing, corysa, and so-called bronchitis. The age of onset of eczema, however, is considerably earlier than that of asthma, and in many instances, eczema is the forerunner of asthma After early infancy asthma becomes the prevailing allergic syndrome. and wherever there is a multiplicity of allergic syndromes, it is generally one of the complicating conditions Asthma was also found to be the dominant manifestation in the allergic antecedents of the children studied. It would appear therefore, that the lung structure is domi nantly predisposed to sensitization because of the large amount of smooth muscle tissue present Antibodies are harbored in the bronchioles in this sensitized tissue and it is here that the reaction ensues when the specific antigen gains entrance into the body The histamine theory does not explain this predilection for lung tissue involvement as well as does the antigen-antibody hypothesis.

The Value of the History

Much can be accomplished by a detailed in quiry into all the circumstances surrounding each of the child's attacks including the things the child has done prior to the attack, the places visited the time of day and season of the year. If this is done painstakingly, it will become quite evident that the attacks have some rela-

Presented before the Section of Pediatrics at the 140th Annual Meeting of the Medical Society of the State of New York Hotel Pannsylvania, May 3 1946

tionship to certain circumstances One can readily surmise that if the attacks come on only at night, or in the early morning, there is some relation to the bedroom furnishings Similarly, if attacks are related to visits, much information can be gleaned that may in many instances clinch If the attacks come only in the diagnosis August or September, there is probably some relation to ragweed, if in the early spring, then trees may be implicated, and in June, grasses By searching for cause and effect, certain foods as well may be discovered to be the incriminating factors A history may thus reveal specific offenders responsible for the child's asthma, without specialized study

General Recommendations for Antiallergic Treatment

With respect to alleviation and prevention of symptoms, certain broad approaches may be taken

Engronment —In cases in which environmental sensitivities are suspected, animal pets may be removed, and all dust-producing articles of clothing, bedding, and furniture eliminated Where elimination is not feasible protection may be given, eg, pillows, mattresses, and overstuffed furniture may be covered with some impervious material, seams and edges being especially carefully sealed to prevent seepage recommend tightly noven textiles made of long-fibered cotton, such as Egyptian cotton, in preference to most of the rubbenzed materials available today, because the latter have a tendency to produce sweating and to crack Horse hair, latex, or rubber mattresses are the ones of choice, if they are not available, the old ones must be carefully covered Wood and metal chairs are preferable to the overstuffed variety

Immunization against the environmental substances is not always effective and, for the most part, I do not advise it—It is far better to reduce dust contact in the home, in the manner outlined, and to permit a moderate amount of contact outside of the home—In this way the child will gradually build up an immunity in a natural manner

Food—For alleviation of symptoms due to suspected food sensitivities, much can be accomplished by the employment of a heat denatured diet, which is composed of freshly heated evaporated milk or raw milk, boiled for at least one-half hour, thoroughly boiled meats of all varieties, broths and soups of all varieties, hard boiled eggs, precooked cereals (such as Pablum and Pabena) and cereals cooked for prolonged periods, spaghetti and macaroni, dextri-maltose, corn or cane sugar, thin melba toast and Ry-Krisp, thoroughly cooked vegetables, stewed

fruits, jams and jellies The emphasis is upon long and thorough cooking in the presence of moisture. Since this diet is devoid of any fresh fruits or vegetables, vitamin C must obviously be provided by adding 50 mg of ascorbic acid a day.

The environmental control should be permanent With the foods, however, after all symptoms have disappeared for a prolonged period, and the child is thriving, one fresh food or lightly cooked food, at a time, may be added to the denatured diet and, if well tolerated, may be continued. In this way it can be determined empirically what foods are at fault, and these incriminating foods must be continued in heat denatured form when the patient returns to an otherwise normal diet. This empiric approach may be successful in many simple cases.

A bronchoscopist recently openly scoffed at allergists, because he never was helped by their "innumerable tests" True enough, for in all of his cases, the asthmatic breathing was undoubtedly due to obstructive bronchial or lung pathology. In young children, therefore, be sure you are dealing with true asthma before proceeding with treatment.

Certain Phases of Diagnosis and Specific Treatment

First, I would suggest that it is a mistake to make a definite diagnosis of asthma on the basis of an isolated attack of dyspnea accompanied by the objective findings of sibilant and sonorous Only repeated occurrences of such a syndrome, especially if preceded by or accompanied by eczema, urticana, or repeated attacks of so-called colds or vasomotor rhuntis, should arouse one's suspicions During the period of observation, much valuable data can be obtained by careful questioning related to diet and environmental factors One can intimate to the parents that allergy is suspected as the cause for the child's illness Thus prepared with the information that recurrent episodes are to be expected they will cooperate more fully with the physician in analyzing the circumstances surrounding the attacks

"All is not asthma that wheezes," particularly in young children, and each episode must be evaluated by the physician in charge. This was strikingly brought home to me in the case of a child who lived at a great distance. The frequency of attacks in this 3-year-old child gave the physician in charge a false sense of security. The mother called the physician who, after listening to the complaints, told her that little Jeffrey probably had another one of his attacks and proceeded over the telephone to prescribe symptomatic treatment. Several days later, the

child died of an overwhelming lobar pneumonia disgnosed a day before death by x ray, sputum and blood examination I have had several cases with asthmatic symptoms that by fluoroscopy and x ray proved to be true intercurrent pneu monias which cleared up with penicillin therapy Contrariwise, a high temperature should not lead to a diagnosis of pneumonia in an asthmatic child, temperatures do occur in uncomplicated asthmatic attacks—contrary to general belief especially in very young children The use of the fluoroscope is as essential as the stethoscope in ruling out lung pathology and at times the only reliable means of so doing Recently, also, two patients with asthma came in with complaint of asthma which proved to be the first stage of measles

I stress delaying the diagnosis of asthma and resorting to skin testing because much harm is done by too hasty an employment of this procedure Many cases of allergy tested in the early stage will give completely negative results It requires time for the skin to become sensitized In some instances the condition is evanescent and clears up spontaneously Hence, the physi cian would do well to refrain from referring a case for testing until the child has had several attacks over a period of at least a year. Once having em barked on skin tests, they should be done with thoroughness It must be realized that despite its limitations, the protein skin test does compare favorably with other important diagnostic procedures-very few of which are infallible and it should not be scoffed at

Perhaps the best method to be employed in children is the scratch test, because it is painless and as many as 35 to 50 tests can be performed on the back at one visit. Anaphylactic shock has never been known to develop from a scratch test. This cannot be said with the same degree of assurance of the intradermal test. The scratch test when performed and interpreted intelligently is far more deheate, and fewer false reactions are obtained. The intradermal test however, is of importance in instances in which the scratch tests are entirely negative or only suggestive in character.

It has long been thought that food sensitivities play the dominant role in allergy of childhood That does not prove to be so for throughout infancy and childhood sensitivities to foods, inhal ants, and contactants run a more or less parallel course Multiple sensitivities are the rule and not the exception Therapeutic measures may fail completely if all possible offending factors are not taken into account. For this reason, if the child is subjected to study he should be tested with all available proteins. More and more tests, rather than fewer and fewer, should be our aim

Unfortunately, the tendency is to do fewer tests.

Tests with extracts made from dust-producing substances indigenous to the child's direct en vironment are very important and helpful vestigations have shown that changes occur as certain materials age, for example, stuffings in mattresses pillows etc molds develop and other substances are found which produce antigenic properties not present in new materials Skin testing is not the sole diagnostic procedure essential for the proper appraisal of all the factors involved in this complicated problem must be studied and treated as a whole The family history the specific history of the child, and an investigation of the environment all aid in an appraisal of the case A complete chemical examination of the blood, blood and nasal cytologic studies, roentgenograms of the sinuses, chest and wrist bones Mantoux test, urinalysis, and psychosomatic factors help to appraise and rule out secondary factors

Having discovered the specific offenders, bril liant results may on occasion, be achieved merely by the climination of the incriminating proteins This may simply necessitate the removal of an animal pet, or a particular piece of furniture, as noted above However, intractable cases of asthma as a rule have multiple sensitivities and the process is far more intricate. In my experience, really good permanent results in such cases can only be achieved after one to several years of observation and therapy, though often benefits may be perceived early in the course of treatment Remissions are too often encountered and unless the parents are carefully edu cated and cognizance given to all complicating factors, discouraging results are the rule.

Specific allergenic treatment may be resolved into three phases (1) elimination, (2) substitution, and (3) immunisation. These must be left in the care of one trained in this field

For the enhancement of the general immunity response of the patient, it is of mestimable value to inject small doses of stock vaccines including a large variety of bacteria. These injections can be given at weekly or fortnightly intervals Here too the caution with respect to large reactions must be observed. If the reactions are large the dosage must be considerably reduced by diluting the vaccine one tenth, one hundredth. or one thousandth fold The anamnestic reac tion then gathers full momentum and the child after a period of such treatment develops an im munity in the same way that he develops a natural immunity to diphtheria and other contagious diseases through minimal subclinical The nonspecific effect of the anam nestic reaction in come unknown manner stimulates antibody formation in general 1.4 Autor

enous vaccines have no particular advantage over the stock vaccines

Symptomatic Treatment of the Asthmatic Attack

This particular phase of the problem is of the greatest interest to us as physicians anxiety and fear engendered in parent and child by an attack of asthma places this disease far in the forefront of emergency practice all, a cheerful attitude should be maintained by all surrounding the patient. If the child is breathing forcefully, and is not cyanosed, there is little danger. The harder he breathes the If a child is cyanosed and has very shallow breathing or apnea, the situation is dangerous If the sounds on auscultation are clear, loud and resonant, with sibilant and sonorous rales, the asthma is of no serious conse-If auscultation discloses feeble sounds and there are moist rales the seriousness is real. If the rales break through after coughing, it is indicative of bronchial plugging Temperature may occur as stated above in the asthma of childhood, do not be misled and change the diagnosis to pneumonia

From the standpoint of symptomatic therapy, no classification of asthma has thus far been satisfactory 5 It is my belief that asthma due to bronchiolar constriction is usually promptly relieved by adrenalin or ephedrine Asthma due to bronchial plugging, on the other hand, is not relieved by antispasmodics, but only through emesis, steam inhalation, and expectorants The bronchiolar constriction usually results from foreign antigens, such as food or serum, which enter the blood stream and act directly on the sensitized bronchiolar musculature producing The bronchial plugging is usually due to an inhalant which enters the air passages directly and produces its chief reaction in the lumen of the bronchi, with edema, excess mucous secretion, and resulting obstruction

General Directions

- 1 Windows should be opened, unless it is very cold
 - 2 A soap-sud enema should be given
- 3 If the child is not too sick, remove him from the bedroom to one of the other rooms Because some factor in the immediate environment may be involved, the asthma sometimes clears up when the child is moved to another room, or while being transported to a hospital
- 4 During an attack, the patient is generally more comfortable if propped up or sat up in a chair
- 5 If an electric fan is available, the breeze blowing directly on the face is comforting and rids the patient of the fear of suffocation
- 6 Above all, the physician should remain composed

Medication for Simple Attack of Bronchiolar

Construction

- 1 Adrenalm (1-1,000), 2 or 3 minims subcutaneously. This can be repeated intracutaneously several times at intervals of fifteen to thirty minutes. If the asthma clears, you are dealing with a spas modic bronchiolar spasm.
- 2 Follow with a sedative—phenobarbital, acetyl salicylic acid, or triple bromides
- 3 Ephedrine sulfate by mouth, 1/4 of a grain, may be tried instead of adrenalin

Medication for a Severe Asthmatic Attack

(Status Asthamaticus or Obstructive Bronchial Asthma) If the child can be removed to a hospital it is to be preferred, but the following treatment can be carried out in the home

- I A slow drip intravenous infusion of 10 or 15 per cent dectrose solution (300 cc for young children, and 500 to 1,000 cc for older children). In this infusion, 1 cc of adrenalm, 1-1,000, can be mixed, making a dilution of 1-300,000 to 1-1,000,000. They value of this lies in the reduction of the dehydration and relief of the edema.
- While the drip infusion is being set up, the child should be given one to two teaspoonfuls of syrup of ipecae, in warm water, to induce vomiting During the retching period, a reverse peristalsis of the trachea may be set into motion, so-called "tracheal vomiting," which will release mucous plugs and is followed by relief so speedily that the result is at times truly dramatic
- 3 At times, the inhalation of steam is as affective as vomiting, the steam causing a thinning and expulsion of the mucous plugs
- 4 The child is then given a sedative by rectum, preferably bromides or chloral hydrate
- 5 An electric fan is kept blowing gently in the patient's face
- 6 If there is cyanosis, oxygen, or preferably oxygen and helium, should be administered by nasal catheter
- 7 Aminophyllin by intravenous injection or by rectum may be of some value, but should not be counted upon for much relief in children

Therapeutic Don'ts 1 Large doses of adrenalin should never be used The repetition of 1/2 to 1 cc of adrenalin is unwise. It does not relieve the asthma but causes an even greater spasm of the bronchioles, thus aggravating the asthma. It also causes pallor, apprehension, cardiac syncope, vascular congestion, increased pulse rate, and heightened blood pressure.

- 2 It is criminal to give morphine or its derivatives during an attack. Probably most deaths from asthma are directly attributable to too much adrenalin and the use of morphine ⁶
- 3 Do not leave the patient in an apprehensive state Do not omit adjuvant therapeutic measures Do not omit some form of mild sedation Do not permit the child to be left alone

Prognosis

Asthma is not a disease that should be treated solely from a symptomatic standpoint, for repeated attacks make one only too aware of the futility of such an approach. It is a physiclogic disturbance which can be mastered if thor oughness is the watchword When the problem is finally solved, there is a signal absence of residual pathology The child who has no further attacks appears normal to all intents and purposes, and stigmata of the disease are nowhere to be found If the condition becomes chronic, emphysema and bronchiectasis may This state is more likely to occur in a neglected case in an adult than in the child

In the complicated cases where the physician in charge appears to make no headway, despite careful observance of the directions detailed above, he may deem it necessary to refer the patient to the trained allergist for a comprehen sive "work up" Such an intensive study can rarely be achieved in less than two to three weeks Above all, the child must be studied as a whole and not only from the allergic standpoint Monthly or biweekly visits to the allergist en able the consultant to check all factors and to analyze each asthmatic episode In the interim the physician in charge carries on, noting any untoward reactions Complete retesting may occasionally be necessary Good results often are immediate but several months, or even a year or more, may elapse before they are achieved in some cases

Prophylaxis

Much can be accomplished prophylactically in the asthma of childhood Recent evidence makes it clear that allergy can develop in children whether born into so-called allergic or nonallergic families Allergens whether food, pollen animal or vegetable dust, serum, bacteria, or drugmay invade the body under certain circumstances Intrauterine life, infancy, disease, and convalescence constitute vulnerable periods during which the individual must be protected from undue exposure to highly antigenic substances

Measures which aim to prevent the inception of food, dust, drug, serum, and bacterial sensitivity are available through the regulation of the diet, the management of the environment, the control of drug and serum therapy, and the reduction of recurrent invasions of pathogenic Awareness of the many factors now known to influence the incidence of allergy may result in a greater control or possible prevention of authma.

Conclusions

- Drugs such as historhinase, Hapamine, benadryl or pyribenzamine have little value in the treatment or prevention of asthma
- Asthma is not a disease that should be treated solely from a symptomatic standpoint, for repeated attacks make one only too aware of the futility of such an approach
- Asthma is a physiologic disturbance which can be overcome, for the child who has no fur ther attacks has a signal absence of the pathologic stigmata of the disease
- Because so much can be accomplished prophylactically, the asthma of childhood should be of especial interest to the pediatrician

SURGICAL DRESSING MATERIALS NEEDED BY CANCER COMMITTEE

In urgent need for surgical dressings to carry on its work of caring for the city s constantly increasing legion of cancer victims, the volunteer Field Army of the New York City Cancer Committee appeals to the public for salvageable white cloth materials

of any description and in any amount.

Worn table linens and light colored window shades are desired for making caneer dressings sheets and other white cottons for bandages. Discarded men s white shirts are needed for making bed jackets

In requesting public cooperation, Mrs. G. k. Ox holm, director of the Field Army, stated that since May 1946 119,291 cancer dressings have been distributed through the Social Service Departments of 38 hospitals in the metropolitan area, through the Visiting Nurses' Association and to individual patients.

Materials should be sent to the Field Army, 2 West 106th Street, New York 20, N Y

THE POSSIBILTY OF PREVENTING BREAST CANCER IN WOMEN

Is Artificial Feeding of Infants Justified?

Ludwik Gross, MD, New York City

(Chief of Research, Veterans Administration Hospital, Bronx, New York)

Mammary carcinoma in mice is caused by a filterable virus transmitted from one generation to another through the milk of nursing females. The virus remains inactive until the infected animals reach the tumor age, at that time mammary tumors develop and kill their hosts. This fatal disease can be prevented by isolating the newly born progeny from their potentially cancerous mothers, and transferring them for the purpose of nursing to lactating females whose milk is free from the cancer agent.

In view of the importance of these observations and their possible implications for human pathology, it was suggested that women having a history of breast cancer, or, more generally speaking, a history of any tumors in their families, should refrain from nursing their babies. Artificial feeding should in such cases be substituted. Should human breast cancer be caused by factors similar to those in mice, it is possible that many human lives could be saved by the simple preventive measure of artificial feeding of one single generation of descendants of cancerfamilies in man

This recommendation was recently challenged, ⁵ the principal objections being as follows (a) abandoning breast feeding may be associated with increased infant mortality, (b) stagnation of milk in breasts of mothers who refrain from nursing may prompt the development of mammary carcinoma, ⁶ (c) the eradication of breast cancer may be substituted by an increased frequency of cancer in other organs ⁵

Discussion of the Objections Advanced

There is ample evidence to suggest that with proper care, which includes sterilization of bottles, refrigeration of the prepared milk supply, etc, infants fed with either prepared cow's milk or with one of the commercially available substitutes for human milk, can be raised with no higher mortality than those fed by breast. It is worth emphasis, however, that either pasteurized or briefly boiled human milk could be safely used for this purpose, since in mice, at least, the tumor virus does not resist pasteurization so It should also be emphasized that, according to experi-

Published with the permission of the Chief Medical Director, Department of Medicine and Surgery Veterans Administration, who assumes no responsibility for the opinions expressed or the conclusions drawn by the author

mental evidence, artificial feeding of one single generation would suffice to'eradicate mammary cancer for generations to come

The assumption that stagnation of milk (resulting from not nursing) may be responsible for the development of breast cancer⁶ does not have any precise experimental support. There is no evidence to suggest that refraining from nursing either causes or accelerates the development of mammary carcinoma in mice. In fact, Bittner reported recently that in a cancerous strain of mice, experimentally produced stagnation of milk actually decreased the incidence and delayed the time of appearance of breast cancer in these animals.

In any event, observations obtained in recent studies on mammary carcinoma of mice appear to suggest that breast cancer will not develop in animals free from the transmissible tumor agent To give an example, we have in our laboratory mice of the C3H line,4 in each generation practically all females develop breast tumors before they reach one year of age Another part of our laboratory is occupied by a colony of animals of the same line, with the exception, however, that these do not carry the tumor agent H B Andervont, of the National Cancer In stitute, removed a litter from a pregnant C3H female, at term, by cesarean section in May, 1942, and transferred this litter immediately for the purpose of nursing to a female mouse (of the black C 57 line) whose milk was free from the cancer agent A litter of such cancer-free C3F mice was obtained from Dr Andervont and i colony of mice was raised from that litter in ou laboratory These mice look exactly like this C3H mice from whom they descend They not, however, develop breast tumors 11 In 0,1 laboratory many of these females have had the litters removed for various reasons immediate; after birth, ie, they were submitted to "mfrd stagnation," and yet, none of them has ever di veloped a tumor These mice are in perfec health, they bear litters often twice as numerou as the tumor virus carrying C3H females, they live their full life span without showing an, symptoms of mammary carcinomas, not a single breast cancer having been observed in these mice in our laboratory

The assumption that the eradication of breast cancer (by artificial feeding) will be substituted

by an increased frequency of cancers in other organs' does not appear to have any reliable expermental or clinical support. One is tempted to compare such a statement with an assumption that the eradication of pulmonary tuberculous would precipitate tuberculosis of the intestines or of bones.

The supposition that people, or animals, have to develop a cortain number of tumors, and that he decrease of the incidence of tumors in one articular organ would automatically be comensated by an appropriate increase of tumors in other sites 12 is based on statistical speculations pen to considerable criticism from both a tatistical12 and an experimental14 point of rinw

Conclusions

Breast cancer in mice is transmitted through allk from mothers to daughters and can be for ll practical purposes exterminated by the simple neasure of foster nursing of one single generation difficult and time consuming studies are necesary to find out whether human breast cancer is lso transmitted through the milk of nursing aothers It will take some fifty or one hundred ears to carry out such a research project

In view of these circumstances a working sypothesis could be advanced at once assuming hat breast cancer in women is caused by factors imilar to those responsible for mammary car moma in mice On the basis of such a hy othesis, mothers having any history of tumors in heir families should refrain from nursing their

babics Since a few hours of breast feeding would suffice to transmit the hypothetic cancer virus, artificial feeding from birth should be substituted, for one generation

It is unfortunate that fundamental observations and discoveries in medicine are seldom accepted without many years of delay The simple preventive measure of artificial feeding of infants born to potentially cancerous mothers will perhaps be generally accepted and introduced only some ten or twenty years hence, instead, the same measure could be applied at once breast cancer in women is caused by factors similar to mammary carcinoma in mice, some 15 to 25,000 women could thus be saved from death each year in this country alone 4

NFANT MORTALITY RATE SHOWS DECREASE IN 1946

Infant mortality declined further in 1946 from the ow rate for 1945, the U.S. Public Health Service, ederal Security Agency announced in January rovisional figures for the first 10 months of 1946 dicate a decrease of 3.2 per cent from the rate for e same period of 1945

Final figures for 1945 released at this time show st the infant mortality rate of 38.3 deaths under rear per 1,000 live births was the lowest ever ra-ded for the United States. It is 3.8 per cent wer than the rate of 39.8 for 1944. Infant deaths imbered 104 684 in 1945 as compared with 1944 hen there were 111,127 deaths under 1 year

The maternal mortality rate of 2 1 per 1 000 live

births for 1945 also showed a reduction of nearly 9 per cent from the rate of 2.3 for the previous year The numbers of deaths from puerperal causes on which the maternal mortality rates are based were 5 688 and 6,869 respectively for 1945 and 1944.

One of the factors contributing to the lower infant and maternal mortality rates is an increase from 1944 to 1945 in the proportion of babies delivered in

hospitals.

In 1945 78.8 per cent of all births regis-tered in the United States were reported to have occurred in hospitals or other institutions. represents an increase of 3.2 per cent from 1944 when 75 6 of recorded births took place in hospitals.

AMERICAN JOURNAL OF PSYCHOTHERAPY

The Association for the Advancement of Psychotherapy announces that the official organ of the Association is the American Journal of PsychotherIts editor is Emil A. Guthell, M.D., 16 West 77th Street, New York 24 The American Journal of Psychotherapy is a quarterly, and is issued in January April, July, and October

AN ANTHROPOLOGIST LOOKS AT AMERICAN INDIAN MEDICINE

ARTHUR C PARKER, Sc D, Rochester, New York*

INTEREST in the subject of American Indian medicine and medicine men has been manifested since earliest historic contacts In North America accounts of medicaments and cures go back to the time of Cartier whose scurvy-stricken crew was brought back to health by the Indians through the administration of decoctions of something called *onehta*, presumably an infusion of the needles of the hemlock (Tsuga canadensis) ** In South America, where agriculture and social development had reached a somewhat higher stage, the exploring European found such substances as coca leaves and quinine bark, the former being used by natives as a narcotic and the latter for malaria

Since the European medicine itself had not advanced far beyond empiricism the effects of native American drugs were noted with interest by ship and expedition physicians The horizons of knowledge had not been lifted far enough in the sixteenth and seventeenth centuries not to continue the hope that in some strange clime there might be found the great panacea, or perhaps effective drugs for all infectious diseases, and that even the length of man's life might be prolonged indefinitely by the discovery of the Fountain of Youth. The explorer and medical man sought, in the new world, and with varied results, for healing waters, magic herbs, and the Paracelsian touch

From every early account it is clear that observers unknowingly classified what was assumed to be medical practice into five or six categories that were either rational or nonrational learn from them that the Indian of America considered that medicine was synonymous with mystenous power The man who could conjure, procure, or generate by brews or gesticulations the magic substances that would penetrate his patient's body and bring about relief or a cure was a medicine man The name has stuck and come down to us with much of its original connotation, that is, the aboriginal doctor was one who might mingle antics with herbs, prayers with legerdemain, and tobacco fumes with ball games, to drive out the demon of diseases

The native American was only a little behind the European in his ignorance of the cause of infectious diseases, especially of the great epidemics that took such a heavy toll The aborigine had neither hereditary immunity nor sci-Experience, however, soon entific knowledge taught him to flee the infected area and not return until the holocaust was over *** His theory was that disease was a demon that entered the body principally through the nose and mouth okit, as he called it, entered the bones and lived upon the marrow, but might take shelter and food for a time in organ and muscle, gnawing away at the tissue and causing pain lenge presented was how to coax the demon to leave the body Hence, there was recourse to emetics, purges, sweats, salivation, and sneezing If these failed, another type of medicine man might be brought into action who might scare the devil out of a patient, or so placate the demon that it would accept the sacrifice, sniff the incense, and depart

The primitive mind is far more sensitive to frustrations, injuries to prestige, slights, unsatisfied desires, and resentments than is commonly known The native practitioner sensed that an unsatisfied mind, brooding upon its misfortunes. might become a sick mind Its vagaries seemed to indicate that it was possessed of an evil spirit and that its brooding or its violence were the result of internal disturbances The patient who was ugly, sullen, unhappy, and dissatisfied, was considered "possessed" Therefore, his case demanded certain satisfaction whereby his mind might be diverted and made clean again the oki would leave Disease was a devil and the devil had to be outsmarted, or, that failing, he might be bargained with and flattered out of the If simple herbs would not accomplish this result, then dances, masked faces, and gesticulation might do it

Aboriginal View of Disease

From this brief survey, we pass to an analysis of the several means employed to bring about a Medicines varied widely among relief or cure the three hundred groups of aborigines north of Mexico, and what one may have employed might have been unknown to the other there is a general similarity of method and practice, for the need of relief was so vital that it leaped over all boundaries in seeking to achieve a very practical result

Presented by invitation at the 140th Annual Meeting of the Medical Society of the State of New York Session on History of Medicine May 2 1946

* Honorary Life Fellow, Rochester Academy of Medicine President, New York State Historical Association.

** By some thought to be Pinus strobus or Thuya occidentable.

^{***} Hrdlicks † Ok: was a demon, generally invisible

We may put down the rites and ceremonies deemed necessary to conjure the supernatural into the service of healing as thaumatorgic ritualism and consider it nonrational or irrational as the case may be Yet, even in such practice there might be found those who would testify to 'cures." The patient had a fuss made over him and got well. He no longer feared that he had overlooked something

Closely associated with the invocation of unseen demons as an agency of alleviation, was the practice of mental therapeutics by which the medicine man sought to divert the minds of his patients from dwelling upon their distress and to shock them into another direction erammed with more hopeful thoughts Once this was accomplushed he would loudly proclaim a cure amounted to a mental repolarization, but the antics, singing, dancing, and drumming, or the brisk game of lacrosse upon which the patient bet (only to win a fixed game) often confused the mismonary observer who deplored the superstition

3 The most common of all methods of combating diseases was that of administering herbs and other substances. While grotesque ceremonies seemed the more spectacular, the natives were not unaware, by virtue of accident or experiment, that certain substances produced desired results. By long experience, a traditional pharmacology had been built up by numerous tribes whose herbalists transmitted a general information from one generation to another Some remedies were thought to be the personal property of individual medicine men and penahed with him, but others were rather common knowledge Most of the agricultural and sedentary tribes of the northeast, for example, knew of purges, emetics, diuretics, demulcents, carminitives, astringents styptics, sudorifics, vermifuges, and other medicines. In the kit of the Iroquois herb doctor, for example, would be found t prickly ash (Zanthoxylum Americanum), sassafras root bark Rhamnus cathartics, calamus rhisomes, wintergreen, bruised bark and root of Quercus alba, Podophyllum, hamlook needles (Tsuga), pussywillow root (Salix discolor), blackberry root, and such inert substances as petroleum, sulphur, alum, burned shells, wood ash (potassium carbonate) and pulverized charcoal. There were many other herbs, as senega, boneset, wild ginger, tens deemed valuable for fevers, and barks, such as alippery elm cherry, walnut, and apple root.

4. There were many empirical theories about diet. Some groups valued animal organs some tabooed certain plants, and salt was generally avoided as causing almost every kind of ill, especially arthritis and debility Food with the

Certain forms of physical therapy were rec ommended, and aweat baths were a common means employed for ridding the body of "harm ful humors." Descriptions of the hut or "oven" where the steam was generated abound in almost all accounts from the earliest to about 1838 Civilization stopped the Indian's Turkish bath and while recommending to him tightly closed rooms to avoid the "miasmitic air of the open." it quite discouraged his bathing

There was originally much rubbing of the muscles with the slime of certain bruised leaves as wintergreen and sweet fern and the fat of animals was employed for a massage lubricant. Some eastern Indians employed strained petrol eum, skimmed from springs in New York and This was also taken internally but was deemed best as a rub for arthritic pains guard against rheumatism, copious draughts of arbor vitae tea were drunk. Thoreau tried it and thought it abominable in taste.

Many of the tribes were fairly able, according to several accounts in the practice of rudi mentary surgery They would excise a limb, extract arrows, set bones, make splints, and pull or knock out teeth After battles they cared for their wounded and bore them away on litters. Treatment in all probability was by rough and ready methods with little attention to surgical cleanliness, save for boiled water, and it is quite astonishing to note the absence of reference to the crippled, lame, and hopeless invalid among them Even during the American Revolutionary war there are few or no accounts of having observed a warrior who was permanently disabled after battle. Only the presence of healed wounds is The European pioneer who wandered among the tribes was sometimes impressed by the skill of native practitioners, and at other times. viewing their appeal to magic they called them charlatans Still, several observers, including the studious Heckewelder and the later Dr Benjamin Rush were not averse to employing the simples recommended by the red man of the forest. Our own pioneer formularies employed by the frontier herbalist were largely drawn from the wandering Indian herb doctor who went from town-to-town selling barks and roots. A volume of medical folklore might be written about the influence of

Iroquois and most eastern tribes was fortified with maise, sunflower, and nut oils, these being deemed highly essential Animal fats, however, were valued, especially bear oil Fish was a very common food and used with their corn foods. Sometimes rattlesnakes were eaten as a delicacy There was something magne about food and one was believed to become like the food he ate, hence venuson, eels, bears, and boiled owl were prescribed

Tom an actual inventory at Cattaraugus Reservation

these medicine men who came to tell of their tribal mysteries, and to make "cures when all else had failed" Many of these tall tales have not yet vanished from the memories of the elder generation in the north

Now, just what kind of people were these American aborigines who had so few diseases and who were healed with such effectiveness? LaHontan tells us that they were a "robust and vigorous sort of people, of Sanguine Temperament, and admirable Complexion" Said he, "They are unacquainted with a great many Diseases that afflict Europeans, such as Gout, Gravel, Dropsy, &c Their Health is firm, notwithstanding they use no precaution to preserve it "fft He goes on to relate that they "are sometimes seized with pleurisies, but these are as infrequent as they are mortal, for this is the only Distemper that all their Remedies cannot conquer" But, says this versatile observer, "Commonly these Quacks bring 'em juices of Plants which are a sort of Purge and are called Maskikik, but the patients choose to keep 'em rather than drink 'em " He is surprised when the Indians tell him more, saying, "But they are yet more astonished at our custom of Bleeding For say they, the Blood being the Taper of Life, we have more occasion to pour it in than take it out, considering that Life sinks when its Principal Cause is moved off"

LaHontan, writing in the early days of the Eighteenth Century then strikes a note that sounds suspiciously like the creed of the Twentieth Century, for, (and we can read it in his original French), he remarks

††† Vide II p 465 Voyages of LaHontan, (McClurg edition), Vol.

"I remember, that in a Conference I had one Day with a Savage, the Barbarian said with a good deal of Sense, That good Air, good Water, and Contentment of Mind could not indeed keep a Man's Life from coming to an end, but at least it must be owned, that these Advantages contribute in a great measure to make a Man run through the Course of his Life without being sensible of any Disorder or Inconveniency They make a jest of the Impatience of Europeans, who would be cured as soon as they are

"They allege that our Fear of Death occasion'd by the least Fever, does so inflame and fortify the disease, that sometimes we fall a Sacrifice to Fear itself, whereas if we looked upon our Illnesses as a Triffle as well as Death, and kept our Bed with Patience and a good Heart, without offering Violence to Nature, by cramming down Drugs and Medicines, the good old Dame would not fail to comfort and Refresh us by degrees"

LaHontan lustily prodded what he thought the foibles of religion and he pilloried medical follies to such an extent that he was boycotted by both church and physician, and yet his book, published in England, in 1709, had such a remarkable sale that it became the world's first best seller People read it and gasped at its audacity, but it tickled their common sense Medication by drugs, however, still prevailed, and men continued to pulverize rubies and mummy meat, notwithstanding LaHontan's observations

Only in this more enlightened era does the layman unite with ${f the}$ physician in attempting to follow the advice given this remarkable man .who wandered naked natives and among came forth with what appeared to be theologic and medical heresy

MEDICINE IN NEW YORK FOLKLORE

HAROLD W THOMPSON, PH D, Ithaca, New York*

THE late Will Rogers never said a truer word I than when he declared that "we are all 1gnorant—we're just ignorant about different things" It will hardly be necessary to say that this paper is written out of a "facetious and rejoicing ignorance" of medical science by a grateful patient who happens to be a student of folklore and literature in New York State short time you are asked to forget the facts that a Garrison or a Sigerist might present, and to listen to a plain account of how the Yorker has gone about curing his ailments without benefit of physicians Some of the materials will be drawn from old memorandum books and clippings pre-

Presented, by invitation, at the 140th Annual Meeting of the Medical Society of the State of New York Section on History of Medicine, May 2, 1946 * Deceased.

served in historical archives, but most of these alleged cures are from oral tradition collected with the aid of several hundred students and friends at the Albany State College and Cornell Uni-Lest anyone try to follow my recipes, let me adopt the warning of an eighteenth century memorandum book now owned in Chautauqua After giving a Negro Caesar's cure for poison, as practiced in Dutchess County, the writer says "If the patient find no alteration after the third dose, 'tis a sign that he has either not been poisoned at all, or that he has been poisoned with such poison as Caesar's remedy will not cure "

As might be expected, our people have cherished herbals or "yarb remedies"-sometimes those brought from the old country, sometimes those learned from the Indians or from experiment. Occasionally, you find the pseudoscience known to folklorists as "signatures," based upon the theory that plants bear a sign of shape, color, or name which indicates what illness they may cure, for example a yellow flower may cure joundice Similarly for dog bite you may apply a "hair of the dog that bites you"—though not in the pleasant sense that has become familiar in American bars. Such a cure from Long Island has for its base the pulverized jawbone of a dog, together with the dried and pulverized "false tongue of a newly foaled colt' and one scruple of verdigris.

The most amusing of folk-cures are not herbals or medications but have the element of the super natural or image. Often they depend upon sheer faith in a ritual sometimes they employ sacred words or invoke spirits frequently they employ what is called "sympathetic magic by transferring disease to an object which is thereupon lost deliberately or destroyed. The clearest way to illustrate all these types is to take up cures for several common allments that could hardly expect a physician's aid in remote farming districts or poverty-smitten slums.

As your memory of childhood might suggest the largest number of cures which we have collected are for warts, bane of children us were told that warts are caused by handling The commonest prescription is to steal a dishcloth from your mother (or a neighbor) then bury it, and wait for it to rot A poetic variant comes from an Italian family at Plattsburgh The patient was a lady whose husband led her under a pear tree in springtime With his right hand he pretended to pick off her warts, one by one, and put them in his left hand, which was clenched as if holding something Then he plucked from the pear tree an equal number of buds and put them into the same left fist. Leaving his wife, he buried the buds and the pretended warts near a railroad track where the wife was not likely to go As the buds rotted, the warts disappeared—all except one. It is possible that the husband, careless as husbands often are had made a mistake in counting the buds or the otherwise this cure might have been perfect

It will be seen that essentially this was a case of transfer or sympathetic magic. In our lore the itual and the objects vary considerably. Let me quote from my files

Face the front door at home. Bite a bean in two and rub it on each wart. Then throw the bean over the left shoulder and never look for it.

Make a crosswise sign with a bean on your wart then feed the bean to a rooster Make a little bag drop a white pebble in it for overy wart you have, and bring it at night to a crossroads without letting anyone see what you are doing

On the first Friday of every new moon, for three nights, look at the moon and repeat three times, 'What I see increase, what I feel, decrease."

Spit on a stone, then stir the saliva and repeat, What I see, decreases.' Then to s the stone aside

Many other objects are used for this wart magic, including bones, potatoes, straws, raw meat, Lernels of corn, pennies, and pieces of rope knotted as many times as you have warts. But it is time to mention a different magic technicthe selling of warts A gentleman whom I shall call Mr Brown was saving goodbye to a farmer at Esperance, New York, after a pleasant vacation Mr Brown jerked his hand away from the farmer's clasp explaining that he had warts that were sore. The farmer said "I will buy your warts I will pay you one cent apiece-it must be a separate coin for each wart. Then you go away and forget all about them, and in a short time they will go away too ' Mr Brown laughed and accepted the pennies Two weeks later he remembered the transaction, looked at his hand and found that the warts were gone A year or so later he noticed that one of the girls in his department at the General Electric Company's plant was putting dots of ink all over her hands She explained that she was doing this to cure her warts. Mr Brown made a search for thirty five pennies and bought her warts. A few weeks later the girl showed him that the cure was complete

The lady who told me this story observed that anyone who would believe in such a cure might well fear to get on his own hands the warts which he had bought. I have since been told of a method whereby you rub one penny on your warts and give it, perhaps in change, to a stranger, whereupon he gets the warts. A more elaborate version of the same shady trick is to get from a brook as many smooth white pebbles as you have warts, dip the pebbles in blood from the warts te them up prettily in a little box, and send them to a friend in a basket of fruit. The friend may think that the pebbles are for his fish-bowl until he finds that he has warts

That the mind may have some effect upon warts—to use a layman's phrase—is indicated by an incident told me by Dr Sigerist, the historian of medicine A physician of his acquaintance had as patient a boy who had a number of warts (some on his face) which would have been difficult to remove by clinical methods. The doctor told the boy that he intended to apply a new medicine which might sting a little but would probably be effective. The warts were painted with colored water, the boy wincing the while, and, soon after, the warts disappeared

Next to cures for warts, perhaps the second largest list is for colds, chills, tonsilitis, sore For colds I have had recommended three throat tablespoons of asafetida in one quart of whiskey, the dose is one tablespoon for a child and a wide ontion for adults Sometimes asafetida is eaten. sometimes it is worn around the neck. Teas are made of blooming mullein, sage and catnip, red seeds of sumach sweetened with honey or sugar, horehound, and hot ginger Still another recipe calls for tea of basswood flowers to which has been added hot rum or whisky-or both calls for a lemon boiled in a cup of water to a pulp, this to be consumed before breakfast for three days For a gargle, salt and vinegar are recommended, sometimes together This would be pleasanter than taking skunk-grease by the teaspoon, as one of my pupils from Morris Plains. New Jersey did

For sore throat there is the good old goosegrease which my mother used Others prefer turpentine and lard, or camphor and lard, or goat-My sister wore amber beads to prevent tallow sore throat A recommended gargle is made from the inner bark of an oak tree Various poultices are made for the throat from flaxseed, or bacon dipped in vinegar, or fat pork under flannelsometimes sprinkled with pepper, or from tomatoes, or fried onions, or butter and pepper The mildest medicine is beaten white of egg with lemon juice and sugar Almost all country children have heard of wearing a dirty sock around the neck, though one polite girl recommended a clean white stocking Jewish mothers swab the throat with rose-honey

Cures for asthma are not so numerous, but I mention one from Schenectady which probably comes from the days when that good town was the center of a colonial fur-trade. This calls for a muskrat skin with the fur turned toward the body over the lungs. A magic cure bids you nail a lock of the patient's hair to a beech tree, the tree will die but the asthma will go away.

For nosebleed I was taught to put a cold key at the back of my neck. A clear example of sympathetic magic calls for letting a few drops of blood fall on a stone—then replace the stone where it was found A recipe from Clinton County recommends letting the drops fall on a wedge of wood which is driven into a hole in the wall "Then go away and forget the whole thing" A sort of "signature" cure calls for wearing a red string around the throat

For cuts the folk use cobwebs to start coagulation, sometimes the cobwebs from a sooty chimney are preferred. For a cut caused by a rusty nail, salt pork (sometimes rubbed in pepper) is applied. I have also heard of putting a piece of silver money on the cut, or of scraping sole-

leather on it A magic cure recommends smearing an axe with blood, then putting the axe under dripping eaves From a German immigrant family comes the ritual of moistening the thumb with saliva, then rubbing it around the cut in a semicircle—one way and then another—all in the name of the Blessed Trinity

For diseases of childhood we have collected many cures, some rather repulsive For croup amber beads are recommended again, or five strands of black thread around the neck, or one black satin thread For whooping cough the most picturesque ritual came over from Ireland to York State, and it calls for two men and a donkey beside the patient The men, with the donkey between them, pass the child over the donkey's back and under its belly without letting the patient touch the ground This is probably as effective as a method reported as coming from Wales vou take the afflicted child for a walk over one bridge and return by way of another student tells me that the proper way is to have the child walk across a bridge three times, another cautions me not to walk on a bridge over a river but to take the patient over some other body of (Lovers of Tam o' Shanter will recognize here a relic of the old belief that evil spirits cannot cross a running stream) Any of these cures for whooping cough are pleasanter than an English-American recipe of roast mouse for the afflicted child Perhaps I should add that I have heard of a college graduate not far from Albany who has her baby wear its underwear inside out to prevent whooping cough entirely

For colic a few drops of peppermint on a teaspoon of sugar sounds like a mild recipe, but other cures are not so attractive Put a spoonful of soot in a cloth and pour three tablespoonsful of hot water over it, let it steep, then give baby a tablespoonful every hour Or have the mother chew carraway seeds and blow her breath into the baby's face Or have Papa blow tobacco smoke in a spoonful of milk For convulsions a French recipe of our Northern Border calls for pulling off the shirt of the victim, turning it inside out, and burning the garment For worms an Italian recipe from Monroe County suggests that the grandmother pretend to cut the worms with a pair of scissors held above the baby's stomach Grandma "murmurs sayings"—whatever that means—then spits on the scissors and throws them into a corner In Otsego County a bag of tansy is hung around the neck to dry up the A Slovak-American remedy is made by worms cooking milk, wormseed, onion, and garlic (Wormseed is an example of signature)

For teething, Job's tears are worn around the neck to prevent the baby's tears—another example of signature, but the baby does profit by something on which to gnaw Rubbing the gums with a silver thimble is also recommended Some of the practices remind us of frontier days, for example, putting a rattlesnake's rattle in a tobaceo bag hung around the child's neck, or letting him chew on cartndges—which must be from a six-shooter, or rubbing the gums with the brains of a freshly killed rubbit

Measles are "brought out" by rubbing the patient down with warmed vinegar in which garlie has been boiled. (The source of the recipe is Jewish.) For mumps a lump of fat salt pork may be tied around the neck.

To get back to the adults now—I wonder why a horse chestnut or buckeye carried in the pocket, or sometimes on a string around the neck, is supposed to ward off rheumatism That is probably as sensible as the "Canuck" method on our border of carrying a potato until it is hard and dry, when the rheumatism will have gone Out in Wayne County the pioneers recommended wearing the skin of an eel around the waist.

For sore eyes washes are made from the root of wild roses, or from mashed mulberry leaves, or from rainwater and sugar, or—in the case of a baby—from just plain milk. There is a belief that wearing rubbers in the house weakens the eyes, and that piercing the ears strengthens the eyes. If a friend thinks that a stye is coming on his lid, just startle him and the stye will not come. Or rub the stye with a cat's tail if you can find a quiet cat. If this doesn't work, go to the first corner and repeat—

Stye, stye, go off my eye

And take the first that passes by

Of course, you must be careful not to be the first to pass that corner thereafter, or you will get the stye back. If a stye has just started, rub

turpentine on it

If you have a headache, you might let a friend blow smoke into your ear, or carry rattlesnake rattles in your hat, or wear earnings, or a red bandana. Some people think that letting the hair grow long is beneficial—a nice trick if you can do it. Others suggest that the patient have a bowl put on his head, the hair cut around the bowl, and the hair promptly burned One of my students says that her mother always feeds her the meat of a peachstone for headache or indigestion "and it has never failed."

Perhaps it is in the realm of preventive medicine that the incredibly numerous tales of prenatal influence belong. We have all heard about the mother who longed for strawbernes and marked her child with a strawberry mark on his neck. It is told of one such child in Ithaca that in strawberry season his "little batch of straw berries always turn red and the little black spots stand out on them." Expectant mothers are also told not to become too much attached to animals or play with them. One of my graduate students was told of a neighbor who was so devoted to her dog during pregnancy that her child, when it came, had a dog on its stomach She was also told of another woman who played with a monkey, who used to sit in her lap and wrap its tail around her neck. Each of this woman's twins had a monkey's tail wrapped around its neck, and the husband was so angry that he shot the family

Out at Niagara Falls, seventy years ago or more, a pregnant mother was knocked down by a Some of her neighbors alleged that her child had a head like that of a pig, and that he was fed from a silver trough I have had the same story from Vermont, so I am not boasting about the case at Niagara Falls. Some pregnant women, if alarmed or shocked, will put their hands to their thighs rather than to the face, so that if a birthmark appears on the child, it will be in an inconspicuous place I have been told of one careless mother near Canajoharie who. longing for a ham sandwich, put her hand to her forehead. Her son had the birthmark of a ham sandwich on his forehead, a mark which did not disappear until his forehead was injured in an accident.

There is time left for only a brief mention of the widespread belief in the Evil Eye victims are usually children Some of you have seen on the petticoats of the children of Italian immigrants little pointed objects in the shape of a horned moon or a spread-tailed fish-charms against this dreaded affliction. If the child's headache becomes severe, someone is summoned who knows the ritual of bowl and olive-oil which determines whether this is a case of the Evil Eye and what cure is to be applied Fortunately the child nearly always recovers—as we all have done under the more scientific care of such gentlemen as are attending this convention. We all have some things about which we do not jest. happens that I do not jest about religion or my two grandsons or doctors. So I shall not end with a joke but with the blessing which the Dutch of New York State used to say to their friends on New Year's Day

Long may you live, Much may you give, Happy may you die, And inherit the Kingdom of Heaven bye and

^{&#}x27;If Teacher amokes a cigarette, she soon will lose her job, you bet. And let her try to powder her nose, or take an interest in beaus, or waste her time at movie shows, by the Old Harry out she goes.

We ain t had a teacher since back last May For some strange reasons, they just won t stay — New York Times Magazine Section, Sunday, March 2 1947

Special Article

IS GENERAL PRACTICE BECOMING A SPECIALTY?

Homer L Nelms, M D, Albany, New York

IN CASTING about for the subject of this vice-presidential address my first impulse was to follow the routine and conventional custom and speak on a purely medical subject have been relatively easy to review the literature and make a further report on a collected clinical series or detail some of the newer observations in medicine made in the course of a busy practice However, having resisted the temptation to be conventional and risking the hazards incident to pioneer thinking, I address myself to a problem that is destined to loom larger and larger with the present trend of medical practice the question—"Is General Practice Becoming a Specialty?"—or, as a corollary, "Should General Practice Become a Specialty?" This question is of extreme importance from a scientific and eco-I propose to discuss it from nomic standpoint In doing so I draw on some of the both angles observations made during the past eighteen years when I served as your secretary and was intimately associated with the problems of organized medicine

All will agree that in our efforts to understand and interpret physiologic and disease processes it is not possible from a modern scientific standpoint, paraphrasing a Biblical expression, for one man to be all things to all men that he might by all means save some The phenomenal advances in medicine and the related sciences during the past forty years have been so rapid and so farreaching that specialization was inevitable and, in my opinion, has become a necessity primarily, but not necessarily alone, from this group that we must look for further progress in our conquest of disease In raising the question, then, my purpose is not to detract nor minimize the importance of the specialist or the specialties in the broader field of medical practice. I do. however, wish to lay new emphasis on the importance of the general practitioner and the unique place he holds in the over-all medical care of our people He is indeed the public's first line of defense against disease and the profession's last stand against the growing inroads of the cults

Time was when the family doctor was the first to be consulted in any illness He was a kindly man familiar with the history of the entire household With limited clinical facilities, he too

Vice-presidential address delivered before the Medical Society of the County of Albany, September 25, 1946 often was forced, and, occasionally, content merely to take care of the patient and let nature take care of the diseases. A combination of physician and priest—Father Confessor of all creeds. We glorify his memory but shall attempt to expand his usefulness and not make him wait until he reaches the next world to receive his just reward.

One cannot consider this question without first considering the general practitioner himself and here I am not thinking primarily of the intellectual or physical loafer who having received his medical degrees considers his education complete and settles back to the false security of a mere pill peddler. Such men are in reality glorified clinical clerks and worthy of little recognition either from the profession or the public

I have in mind the educated man armed with a college degree, trained in the basic sciences, and able to use his five senses The resourceful individual who, having entered the profession of medicine, accepts the challenge and responsibility of general practice with the same enthusiasm and anticipation of equivalent returns that comes to the recognized specialists in other fields He attends postgraduate lectures, reads his medical journals, attends what meetings he can, studies his obscure cases, learns to differentiate between trivial and serious complaints, promptly recognizes his own limitations, and draws upon his own wealth of experience to either cure or direct the patient without delay to more competent hands Such a man would be a success in any specialty for he practices the broadest specialty in medicine, that of general practice I maintain that this man is also a specialist in his own right in this particular and difficult field of practice Should an examining board be created, as in other specialties, and examinations properly conducted, only the best could qualify and having done so he should take his rightful place in public and professional prestige and fees with other recognized specialists Such a concept calls for some refinement and improvement, particularly in the field of diagnosis but, remember, other specialties were also crude in their beginning

In reviewing present trends in practice and indugling in the necessity of projecting ourselves into the future, we must sooner or later come upon this problem. Is general practice also becoming a specialty? In attempting to answer

this question, we are immediately faced with a series of professional trends which have a very distinct and important bearing on the problem The first of these, and one of the most important. is the growing tendency of patients to seek the services of specialists directly By common knowledge they think they know the best derma tologist, the best surgeon, or the best eye man and when in need of such obvious services they con suit these recognized specialists directly and thus bypass the general practitioner or the family physician for this particular difficulty larger sense such practice is not the best that scientific medicine offers, for the particular com plaint may be only a minor manifestation of a more fundamental ailment that only a careful and complete history and physical examination can disclose. Every specialist feels better when the patients are carefully studied before they get to him and some have even gone so far as to refuse to see new patients until they have been carefully studied. Nevertheless, the tendency to bypass the general practitioner is growing

The second important factor is the tendency of recent graduates to enter the so-called specialtics directly upon completion of their training and often without a firm background in general medicine. In this same connection we must consider the problem of the returned veterans who are no longer content with the poor pay longer and ir regular hours in practice, and lesser prestige afforded the general practitioner. They are seeking to get into a specialty where fees are more lucrative and calls by appointments only are the accepted practice, thereby making better working

If you have any misgivings about the question under discussion, consider the plight of the public and, yes, of the profession itself if every medical graduate were to exercise his prerogative meet all the qualifications of the specialty of his choice, and limit his professional activities to one field alone. This practice carried to its ultimate conclusion would work havor with the profession and the public for that intimate contact between physician and patient would be lost, patients especially for the functional disorders, would flock to those cults which already exist and new

conditions for the doctor

specialists.

This tendency toward specialisation can be expected to grow in the future as it has in the past Witness for instance, the field of general surgery and contrast it today with that of fifty years ago Today we have the brain surgeon, the eye surgeon, the nose and threat surgeon the thoracic

ones which would come In this same connection

it is interesting to note that the Committee on the

Cost of Medical Care has estimated that not more

than 18 per cent of the medical profession need be

surgeon, the abdominal surgeon, the gynecologist, the genitournary surgeon, the traumatic surgeon, and the end is not yet in view. In the field of general medicine, we have the cardiologist, the neurologist, the demanding the content of the demanding the end is not yet for we have the diabetto special ist, the rheumatic specialist to mention only two and there are more to come

While such an array speaks well for the ad vancement of medicine, and I would not have it otherwise. I think it should also emphasize the utter helplessness of these specialists when out of their respective fields and should give new dignity and prestige to the general practitioner and the general surgeon for their competence in the most necessary but difficult field of medical practice It is common knowledge that 85 per cent of hu man ills could be adequately cared for by a competent general practitioner but the present trend away from him is becoming so great that he himself will soon stand out in bold relief as a specialist in general practice. We are all familiar with the patients who have travelled from specialist to specialist to specialist, only to find ultimate relief and solace at the hands of competent and under standing general practitioners.

To maintain a practical working knowledge in these respective fields, whether as a practitioner of general medicine or general surgery, is an intel lectual and professional triumph and worthy of the term "specialist" in its own right Smaller and isolated communities must have most of these requirements wrapped up in one pair of hands and one set of brains and the resourceful soil who can do most of them well, maintaining a favorable morbidity and mortality rate, is worthy of our most venerable admiration.

One does not go far along this line of thought until he encounters the question of fees and this is especially true where insurance is involved whether it be workmen's compensation or medical expense indemnity insurance or any type of prepayment medical plan. Most of them start with the minimum fee for the general practitioner and a maximum for the specialist despite the fact that the ordinary course of the disease may be the same in one hand as another. To mention only one illustration, the Army has demonstrated that the average case of gonorrhea can be cured within forty-eight to seventy two hours with adequate penicillin medication One cannot be blamed for asking the question why one man should receive a larger fee than another both using the same drug and the same technic in uncomplicated cases An appendectomy, even without complications, is listed at \$100 but acute coronaries and pneumonia, far more hazardous and timeconsuming for the doctor still seem to ment only

\$3 00 a call Such inequities must be corrected if general practice is to survive and attract the best minds in medicine

To the competent general practitioner who elects to stay in this field or the prospective graduate who is shaping his career, the future is not without hope In 1936 the South Carolina Medical Society created a Section on General Practice Ten other state societies have since done likewise, and in 1946 the American Medical Association for the first time conducted a Section on General Practice In September of 1946 one of our leading publishers mailed its first issue of a new monthly called The American Practitioner manned by an editorial board consisting of the best minds in American medicine The question of certification of the general practitioner as a specialist can be expected to receive increased consideration The New York Times in an editorial on February 9, urged that general practice be made a specialty All these happenings would seem to point in the direction that general practice as now constituted is in itself a growing specialty which has not received its full recognition either from the profession or the public Competent practitioners as a group can be expected to organize, hold their scientific meetings, press for increased recognition in state and national associations and demand fees commensurate with their ability as have other specialties The wise medical school will find a place on its faculty, and the progressive general hospital will not over-look the ability and intellectual integrity of this group in making up their staff all, let us make sure that only the competent qualify

In conclusion, I would say that the general practitioner is a scientific and economic necessity in the makeup of medical practice as now constituted. He should not be discriminated against either in fees, or in prestige, or in hospital privileges, but should receive adequate recognition with the specialist for his competence and ability in this the most important and difficult field of medical practice. The responsibility for this recognition rests primarily with the profession itself to convince the public of the importance and absolute necessity of the general practitioner in the over-all medical care of our people so that he will no longer be the forgotten man of medical

Where is one of us who, if he were sent to one of the "Islands of the Sea" and provided with the services of just one physician, would not feel more secure against the hazards of disease in the hands of a competent general practicationer than that of any other group in the professional field?

To the general practitioner I would say that you have a field of medicine particularly your Accept its responsibilities without exploiting its opportunities You are the public's first and last line of defense against disease group that can save the public and the profession against the insiduous and growing inroads of the Medicine's final answer to the threat of bureaucratic medicine whether it be initiated by a governmental unit or any other high-sounding well-meaning, but misdirected voluntary group The future destiny of medicine is in your hands You, of all others, can give medicine its true balance wheel It is our responsibility that we help you in these objectives

SOCIAL PSYCHIATRY IN THE TREATMENT OF NEUROSYPHILIS BY INDUCED MALARIA

Applied social psychiatry is an essential procedure in achieving effective treatment of neurosyphilis Knowledge that the disease is venereal creates an emotional disturbance both in the patient and in his family which may give rise to a superadded neurosis in the patient and a neurotic breakdown in the family Education and reassurance by the doctor can prevent these complications and obtain increased cooperation in treatment

The physician must accept responsibility for the

treatment of disease and likewise must recognize and control adverse external circumstances Retraining and 10b placement are important elements in the plan of therapy

The best results are obtained by close cooperation between the physician and a trained medico-social worker. The criterion of successful therapy is the degree of satisfactory functioning of the patient in society—Whalen, M, and Bree, M. H. The Lancet, October 5, 1946.

"DOCTOR JONES" SAYS-

In the past thirty years public health has been running neck and neck with medicine in the way it's developed and unfolded. Today it's a specialized, scientific field and a broad one. It's no longer a part-time job but one that calls for years of special preparation. The trained, full-time health officer of

today, because he knows his stuff, when he does things has a reason for 'em and knows the results to expect

As the fellow said when he ran over the cat the results speak for themselves —Paul P Brooks, M D, in Health News, February 10, 1947

ADDITIONAL ANNUAL REPORTS

MEDICAL SOCIETY OF THE STATE OF NEW YORK

1946-1947

Report of the Treasurer

To the House of Delegates Gentlemen.

The accompanying letter of transmittal and excerpts are taken from the report of the firm of Hackaling & Oberkirch, certified public accountants, who examined the books of the Society for the year 1946.

There are several facts of the report to which I would like to call your particular attention. You will note that operating expenses have been greater than income and this is the first time that this has occurred in many years and although the amount is not alarming (\$473.25) nevertheless, the trend is significant. Most of the departments and bureaus are operating at increasing costs which are, in the main, caused by an increase in the direct service to your members.

The cost of printing, paper and handling charges relative to the JOHNAL show an increase over the previous year of \$10 567 30 and judging by present economic trends we will be faced with additional future costs during this and succeeding years.

It is interesting to note that during the year 1946 remission of dues on account of service with the armed forces was granted to 4,476 members. This figure is 42 more members who were granted remissions for the year 1946 than for the year 1946. Attention of this House is called to the fact that these remissions will continue for at least another year for by action of the House of Delegates remissions were granted for the duration or time of service with the armed forces plus one year and the balance of the succeeding fiscal year. This represents a loss in income of \$44,760 in 1947.

At this time the cost of the new Directory cannot be foretold accurately However in order to give the members some idea of increasing costs which have occurred during the past year I would quote from the report of my predocessor Dr Kirby Dwight In his report to the House of Delegates dated March 22 1946 he stated, We are at work now on the Directory which will cost at least \$24 000 before we are finished. I quote this passage from Dr Dwight's report only for the purpose of emphasizing what I have said about the increasing costs.

It is my prediction that the 1947 Directory will cost the Society approximately \$40 000

I cannot alose my report without expressing due thanks and appreciation to all members of the staff of the Medical Society of the State of New York with whom I have come in contact for their helpful, willing cooperation at all times.

Respectfully submitted,

JAMES R. REULING M.D., Treasurer

March 28 1947

Auditors Statement

We have completed an examination of the Balance Sheet of the Medical Society of the State of New York as of December 31 1946 and the Statements of Income and Surplus for the year ended that date, and have reviewed the system of internal control and the accounting procedures of the Society and, without making a detailed audit of transaction, have examined or tested accounting records of the Society and other supporting evidence by methods and to the extent we deemed appropriate Our examination was made in accordance with generally accepted auditing standards applicable in the circumstances and included all procedures which we considered necessary

We did not confirm the unpaid members' dues by correspondence with the members.

In our opinion, the accompanying Balance Sheet and related Statements of Income and Surplus present fairly the position of the Medical Society of the State of New York at December 31 1946 and the results of its operations for the year ended that date in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year

Respectfully submitted
HACKELING AND OBERGERCH

Report of the Council

PART VI

Medical Service and Public Relations

The Council Committee on Medical Service and Public Relations has the following membership

Harry Aranow, M D , Chairman, Bronx Walter W Mott, M D , White Plains Leo F Simpson, M D , Rochester

During the past year your Committee has been primarily interested in the activities of the Council on Medical Service of the American Medical Association, and in cooperating with that body

The Chairman and other representatives of our Society attended meetings of the Middle Atlantic States Conference of the American Medical Associa-

tion Council on Medical Service in Philadelphia last May and December At these meetings, men from the several states and representatives of the American Medical Association discussed such topics as medical expense indemnity insurance and medical care plans, the Murray-Wagner-Dingell Bill and the Hill-Burton law, "home town" medical service for veterans, and proposed medical service for bituminous coal miners

The results of these conferences were reported to the Council of the Medical Society of the State of New York, and have helped guide our

policies

Report of the Council

PART IX-Supplementary Report on Legislation

To the House of Delegates Gentlemen

The Council Committee on Legislation respectfully submits the following report

This report is prepared to conform to resolutions of the House of Delegates at annual meetings in October 1945 and April 1946. The elimination of illegal practice by members of cults has been a matter of discussion before the House of Delegates for many years in succession. Many suggestions have been made in regard to amendments to the law which

were thought would be an aid in the elimination of cult practice. In April, 1045, the Council voted to set up a special committee of the Council to study the question of medical practice in the State of New York and to report back to the Council with regard to a program on this matter for 1945 to 1946 special committee became known as the Special Committee to Study the Question of Medical Prac

tice in the State of New York, or in short the Medi-

cal Practice Committee.

The Medical Practice Committee held a number of meetings in the summer and fall of 1045 The report of this special committee was made to the House of Delegates at its annual meeting in October, 1945 The House of Delegates accepted this report after a lengthy discussion of the many questions submitted in the report. At that time the motion, 'that the information which has been collected by this special committee be edited and published in the JOURNAL for the information of every member of the Society"
was carried At the meeting of the House of Delestates in April, 1946 a recommendation was made
"that the Council and the Executive Officer of the Society should study all proposed legislation which aims at the elimination of cult practice. An amend ment was also made to add, and that a report be presented to the House of Delegates at its next annual meeting. A substitute motion for the orig inal and the amondment was also made and this motion was to refer this matter to the Council "for The motion to refer the such action as it sees fit. matter to the Council for such disposition as was seen fit, was carried.

At its meeting in June 1948 the Council voted that this matter of a study of all proposed legislation which aims at the elimination of cult practice be referred to the Legislative Committee or one of its sub-committees. The purpose of this article, then, is to present the results of this study by the Legislative Committee and the study of the Special Committee to study the Question of Medical Practice in the State of New York, both for publication and for presentation at the next annual meeting of the House of Delearies.

of Delegates.

Your committee has made a study of this matter we have not only examined proposed legislation, but have sought out and listened to everyone who might have something to contribute, we have tried to ob-tain statistical evidence for the points of view ex pressed. In this respect we have been successful in some instances, although in other cases we have been unable to obtain factual corroboration of opinion A great deal of consideration has been given to the question whether or not New 1 ork State should or should not have a basic science law. This question has come up at each annual meeting of the House of

Delegates for a great many years.

In this report we decided to begin with the question of the desirability of a basic science law for New

York State, as this has been discussed and em phasized more than any other proposal for legislation It was thought that we should begin with an examination of the phrase, "basic sciences." This term is usually understood to include the subjects of anatomy physiology, chemistry bacteriology and pathology—in other words, the elementary and fundamental sciences upon which all healing is based. Thus, a basic science law is a law which would require any applicant desirous of practicing any branch of the healing arts to pass a uniform examination in the basic sciences this requirement to be fulfilled prior to the admission of the candidates to professional examination and licensure. establishing a basic science law or examination are usually presented to state legislatures with the reasoning that the provisions in such a law would set the standards of knowledge in the basic sciences for all the healing arts and such knowledge should be possessed by all applicants who would hold them selves out for the practice of the healing arts. Legisstative power thus exercised is regarded as an exten-sion of the police power of the state in the field of public health as a protection to the public. In states having multiple examining boards for various schools of practice and where a number of the cults were also licensed, such protection of the public was considered necessary as there was no uniform standard in those states being maintained by the multiple examining boards. The high standards that may be set by the examining board for the practice of medicine may not be equaled by another board licensing another school of practice or cult in fact, there were evidences in states where an applicant who was not thoroughly grounded in the basic sciences could obtain a license for the practice of the healing arts. Efforts made to bring the examinations of the various boards up to proper standards were of no avail. As a matter of protection to the public it was thought advisable in such states to have a common examination which all applicants who desired to practice any form of the healing arts should be required to pass. On passing this common examination the candidate for a license would receive a certificate known as the basic science certificate which he would be required to present to the board before which he appeared for examination and licensure It should be emphasized that the primary purpose of the basic science law in those states with multiple examining boards was to insure that all candidates for licensure had proper training in the basic sciences.

It has been found in some states, however that this law setting up the requirement for a basic science certificate could be used to advantage in eliminating illegal practitioners. It was found that convictions could be obtained under the penal code if the illegal practitioner had not complied with the law requiring a basic science certificate. It should be emphasized, however that this is a secondary matter under the basic science law and not the primary object of this law

There is no need for such a law in New York State for the purpose of protecting the public in connection with those who are legally licensed for practicing the healing arts. In New York State our prerequisites for medical licensure are as high, if not higher than in any other state in the country All applicants must pass examinations not only in the bane sciences

listed above but also in diagnosis, surgery, obstetrics, gynecology, and in hygiene All applicants for licensure for the practice of the healing arts in New York State take and must pass the same examina-tion Therefore, in New York State there is no need for such a law for the protection of the public in connection with those who are to obtain a license for the practice of the healing arts. It must be recognized, however, that there are a number of cultists practicing in New York State who are not licensed or have no legal standing for their practice. It is estimated that there is approximately one chiropractor for every fourteen physicians in New York State For the most part they practice quite openly, using name plates on their doors and advertisements in the classified section of telephone books We, as members of the medical profession, have always realized that these "healers" should not be permitted to treat gullible individuals who are unable to discriminate between genuine and meretricious med-But the ways and means to achieve this end have not always been clear, since the legislative safeguards of the public health which we already have must not be weakened

Some years ago Louis Reed, Ph D, 2 made an able study of the cults As he points out, "medical sects are not a new phenomenon" Ever since medicine evolved from the guessing state into an exact and authoritative science, it has been beset by healing cults of one variety or another On the basis of different ideas in therapy or cause of disease, such schools of practice as the homeopaths, the eclectics, the physiomedicalists, and osteopaths developed "Today these groups for all practical purposes no longer exist. The practitioners who composed them longer exist gradually abjured sectarian doctrines and, when there were no longer any real differences between them and 'regular' physicians, were absorbed into the general body of the medical profession" It is obvious, then, that where the various schools of practice have accepted the scientific developments in regard to the basic sciences, they have come to the same point and united Those schools of practice or cults which have not progressed with science or accepted such viewpoints usually die out in a matter of years Why, then, are cults such a problem? Dr Reed's

comments on this subject follow

"The problems contingent upon the existence of healing cults are important, despite the fact that they are not new In the first place, life and health at times depend upon the science and art of medicine and those who practice it. It is imperative, therefore, that those who treat disease should be schooled in the established facts of medical science, and be reasonably well trained and competent in the art of medicine It is a serious matter when persons not properly trained in the medical sciences are permitted to practice existence of such individuals lowers the quality of medical care available to the public and constitutes a distinct menace to its health"

Cults have always existed in all nations, in all countries As old ones died out, new cults developed The cult groups at the turn of the century are today replaced by other groups holding different theories as to the cause of disease and method of therapy largest group of cultasts in the United States is the practitioners of chiropractic (estimated at 30,000) who believe that all diseases and illnesses are due to nerve interference, caused by subluxations of the vertebral column and that by "adjusting" these vertebrae the patient will be restored to health The

educational standards of the chiropractors and other smaller cults, such as naturopaths and naprapaths, are nonexistent Requirements for taking a "professional course" may be a high school diploma, but the financial status of the applicant (ability to pay tuition even on extended payment plan) is of so much greater importance to these "schools" that waivers of educational prerequisites are ridiculously easy to The length of school terms is also highly One school advertises, "You may start any obtain time and earn money while learning by giving treatments in our clinic," and some schools qualify the students by correspondence courses At the end of nine, twelve, or eighteen months, or whenever the student's funds give out, he may obtain a treatment table on time payments from the Palmer Institute

for Chiropractic and enter practice
Chiropractic leaders are trying to raise the educational standards of their group
They recognize that educators and many legislators regard cults as a menace to the public health and that the legislators will make every effort to minimize the dangers inherent in the activities of cults How far such improvement will be possible with the present group of chiropractors is, of course, open to question This problem of control of cult practitioners is, however, as has been pointed out, nothing new, nor is the problem of those who are not properly trained attempting to practice, new We find a regulatory measure applied to New York City enacted by the Colonial Assembly of New York in 1760 It was entitled, "An Act to Regulate the Practice of Physic and Surgery in the City of New York." It can be seen, from the following excerpts that this act was clearly for the protection of the public

"Whereas many ignorant and unskillful persons in physic and surgery, in order to gain a sub-sistence, do take upon themselves to administer physic and practice surgery in the city of New York to the endangering of the lives and limbs of their patients, and many poor and ignorant persons inhabiting the said city, who have been persuaded to become their patients have been great sufferers thereby For preventing such abuses for the future, be it enacted no person whatever shall practice as a physician or surgeon

before he shall first have been examined after due examination of his learning and skill shall be approved and admitted to practice "

We find in the record of New York State and its legislative acts, from these Colonial times up to the present, concern over the methods in which unprincipled people attempted to practice various healing arts. The record of the Legislature has been a series of acts which would raise the standards for the practice of the healing arts, medicine or surgery for the sole purpose of protection of the public nearly a hundred years the press and medical journals carried numerous articles praising and condemning various features of the laws under which the doctors of New York were licensed. During this period we find legislative amendments which prohibited barbers to hold themselves out as surgeons, the Indian medicine man with his roots and herbs from promising cures for all evils, and the treatment by the miscellaneous "healers," as coming within the practice of medicine. The amendments to the Public Health Law and the Medical Practice Act first attempted to define and then to limit the rights of candidates who were to be licensed to practice the healing arts

The requirements for a license to practice the heal-

ing arts were stopped up to higher levels as the edu cational facilities and the scientific developments demanded. A number of procedures by which a license could be obtained have been tried during this period of time. When the Medical Society of the State of New York was established with its component county societies this organisation was made responsible for the examination and certification of those candidates for licensure. When the Homeopathic State Society and the Eclectic State Society were incorporated with their component county medical societies they were also given the right to grant licenses. A diploma from a recognized medical school was accepted for licensure when registered in the county clerk's office The Board of Regents in the Department of Education also established under the State laws an examining board and were able to grant diplomas and licenses for the practice of medicine It then appeared that in New York State these multiple sources for licensure were a danger in so far as standards for such licensure could not be maintained at the same level sufficiently high to protect the public

Around the turn of the century medical journals and the press contained voluminous articles in which the writers indicated their belief that since the aim of all healing is the prevention and cure of disease and the prolongation of life there must be one set of principles which all who undertake the care of the human body must recognize. So strenuous was the demand of these editorials that even nonprofessional people interested themselves in the discussion of the standards of basic scientific education which should be possessed by all candidates for licensure in the

healing arta.

This sentiment crystallized in 1907 when Arthur G Root, 'Chairman of the Committee on Legislation on the Medical Society of the State of New York, noted 'A most important measure was introduced in the Assembly and was known as the Assembly Public Health Committee a bill. The object of this bill is to limit the practice of medicane in the establishment of one medical board for all medical schools irrespective of sect or creed. In the judgment of the Committee on Legislation this is by far the most im

portant medical bill before the session.

In 1907 New York State combined the several branches of medicine that were practiced in the State into one group laid down requirements for entrance to examinations, and granted an appropriate license to those who successfully completed them Dr. Draper 'then Commissioner of Education, said, 'This is an exceedingly important act relating to the State examinations for admission to medical practice in this State. The essential and important features are that a single board of nine members, to be appointed by the Hegents, is substituted for the three boards herotofore existing, and the examinations are limited to the scientific branches fundamental to all medicial practice (healing arts) and common to all schools of medicine."

If we examine carefully the requirements of licensure discussed in this Medical Practice Act of 1097 one can readily see that essentially it is a basic science act. The same requirements listed by states currently sponeoring basic science legislation are given. In fact, one can readily see that we in New York might proudly say that we had the first basic science act ever passed. We have never called it that. All we have ever done is to recognize that cuits are a mense to the public health and whenever possible we have urged the Legislature to impose on individuals who desire to practice medicine legal restrictions which will parallel the increasing complexity of medical selence.

New York, one of the original thirteen states, went through the travail of medical licensure very early The western states, where the theory of basic science legislation was disceminated early, acquired their licensure troubles at a later date. As people traveled west, communities rapidly developed and became political entities almost overnight. With governments established, one group after another began asking for prerogatives. First, the doctors sought recognition then, following their example many groups of quacks and pseudopractitioners sought licenses to practice their respective methods of diagnosis and treatment. After a while the phy sicians and the public discovered that there was a lack of uniformity in the educational qualifications possessed by their various groups as well as a lack of uniformity in the manner in which they conducted their licensing examinations. And so it was conceived that inasmuch as there is a certain fund of knowledge which should be possessed by everybody who expects to engage in practice it would be to the interest of the public health to require that they all take the same preliminary examination in funda-mental subjects and then take another examination under their own special board in their peculiar methods of diagnosis and treatment.

In order to prevent unfairness in the examination it was agreed that the examiners should not be identified with any of the various schools of practice but be members of the faculty of established institutions of learning. As each state has felt the need—perhaps one should say that as the arternal pressures increased—the legislature of that state has provided for a revamping of licensure requirements in an effort to improve the quality of medical care.

At the present time the forms of licensure regula tion may be classified in four ways (1) five states have a single licensing board no basic science act, and no legislation on cults (2) eight states have single licensing boards to license chiropractors but are under medical board supervision and there is no basic science act ** (3) eighteen states have multiple licensing boards and no basic science act, † and (4) avventeen states and the District of Columbia have multiple licensing boards and a basic science act, †

Thus we see that states have tried to solve the cult problem existing in their jurisdictions by a variety of legislative devices. Eighteen are currently using one form or another of a basic science law New York, having unified its multiple boards in 1907 is currently beset by the problem of what to do about the chiropractors.

What then should be done about this problem? Will the passage of a basic science law meet the public's need for safeguards against cultists?

This survey, which is an attempt to explore the whole picture has been conducted in the following manner

I The subcommittee appointed by the Committee of the Council on Legislation to undertake this study requested the Executive officer of the Society to prepare a questionnaire which would

^{*} Louisiana Massachusetta Missiasippi New York, and Texas.

^{**} Alabama, California, Illinois Indiana, New Jersey Ohio, Pennsylvania, and West Virginia.

T Delaware, Georgia, Idaho Kansas Kantucky Maine, Haryland, Missouri, Montana, Nevada, New Hampshire North Carolina North Dakota, South Carolina Utah Vermont Virginia, and Wyoming.

Transona, Arkhura Colorado Connecticat District of Columbia Florida Iowa, Michigan, Minnesota Nebraska, New Mexico Oklahoma, Oregon, Rhode Island South Dakota, Tennessee Washington and Wisconsin.

cover all the possible phases of basic science legislation. This questionnaire was to be sent to the Secretary of the State Medical Society, the Secretary of the Basic Science Board, the President of the State Medical Society, and the Secretary of the State board of Medical Examiners in each state having basic science legislation. The data given in replies to this questionnaire were tabulated for this report

The replies received and a tabulation of the answers are available for examination in the office of

the Executive Officer of the Society

2 In addition, those members of our Society who urgently favor the adoption of basic science legislation have been kind enough to give the committee copies of all the correspondence they received on this subject and have also attended conferences to discuss

the subject

3 Further, your committee has tried to analyze the laws of each of the forty-eight states from the standpoint of the type and extent of medical legislation on the statute books and the enforcement machinery to effectuate this legislation. In this connection the material gathered by the Legal Division of the American Medical Association has been reviewed and we have made a lengthy sampling of the types of bills introduced in state legislatures on the question of medical licensure as reported in the Journal of the American Medical Association over a period of several years.

The information gathered from these sources may

be classified in the following manner

1 The licensure practices of states prior to enact-

ment of basic science legislation

2 The enforcement procedures available in these states for the prosecution of unlicensed cultists and those licensed cultists who exceed the limits of their licensure restrictions

3 Opinions from various sources about the effectiveness of basic science legislation in prose-

cuting these categories of violators

4 Other facts gleaned from comments and covering correspondence, pertinent to the issue

Licensure Practices Prior to Enactment of Basic Science Legislation —Three fourths of the states (fifteen out of twenty) having a basic science law had separate cult licensing boards in existence at the time of passage of this legislation. Of the remaining five states, two set up separate licensing boards for chiropractors at the time the basic science law was instituted, one licensed chiropractors under a single examining board, one permitted chiropractors to practice, though unlicensed, if they indicated their unlicensed status to the public, one had a "joker" put in the law which rendered it inoperable

Of the entire twenty states having basic science legislation only Virginia had a licensure procedure similar to our present one in New York at the time of the passage of its law Even here no comparison can really be made, for Virginia's basic science law is a temporary measure aimed at regulating chiropractors who are already practicing in that state and, therefore, it cannot be classified as ideal basic

science legislation

It must be concluded that from the available material it is evident that all the remaining states had granted some form of recognition to chiropractors either before or concurrently with the passage of their basic science act

Enforcement Procedures —The methods used to enforce compliance with both the basic science and the medical licensure acts of the states whose representatives were questioned vary greatly sistent pattern exists to facilitate analysis of enforcement procedures vs effective control of cult practitioners In some states the prosecution of violators is left entirely to the local prosecuting attorneys, in others the office of the state's attorney general is responsible for such action, in a few the State Board of Health has enforcement powers Only in Kansas does the State Board of Medical Examiners have power to do more than recommend In Kansas the Board of Medical Exprosecution ammers can go into court and obtain injunction against an unlicensed practitioner of a healing art In Minnesota the State Board of Medical Examiners has succeeded in obtaining a high degree of compliance with the law by retaining an attorney whose function it is to investigate complaints of illegal practice, prepare cases for prosecution, and refer

them to the prosecuting attorney for action
Almost all of the states having basic science legislation reported that licensed cultists exceeded the limits of their licensure, but they further stated that while detection of such illegal practitioners was possible, conviction was almost impossible to obtain for various reasons. In most instances in these states the prosecuting power is centralized in a state body on the principle that convictions could thus be obtained without fear of political reprisals, but one reply did state that such fear made their Department of Health reluctant to initiate action against cultists

It would appear from the material examined that basic science legislation has not provided an effective mechanism for prosecution of unlicensed cultists except in those states whose penal code permits a conviction and sentence without jury trial. It is thought that under the Penal Code of New York State a cultist arrested for illegal practice could demand a trial by jury, and, if so, this procedure would be no more effective than under the present Medical Act. It was also gathered from the same material that the basic science legislation was not effective in detecting or prosecuting the licensed cultists who exceeded the statutory limits in their practice.

Basic science legislation is generally held to be more effective in the prosecution of individuals alleging themselves to be physicians and practicing illegally than in the prosecution of cultists practicing as such. This is not needed in New York State under the present requirement for annual registration, which has been found to be an effective measure for preventing unlicensed physicians from

practicing

Effectiveness — Much of the material available from the questionnaire concerning the effectiveness of basic science legislation in keeping down cults is opinion evidence. One of the replies bearing on this point is as follows. "None of the members of the Board of Basic Sciences has seen fit to assume the responsibility of saying whether our basic science law has brought about beneficial results. That is one of those questions that probably would require a great deal of investigation, and would likely then remain wholly in the field of opinion." However, the over-all picture is approximately as follows. The secretary of the Board of Basic Science Examiners was usually more enthusiastic about the beneficial results of the legislation than the Secretary of the State Board of Medical Examiners who, in turn, frequently thought more highly of the legislation than did the Secretary of the State Medical Society.

Of the twenty-one states to which queries were

sent, fourteen replies were received from secretaries of state societies, fourteen from secretaries of state Boards of Medical Examiners eleven from presi dents of state societies, and fifteen from nineteen secretaries of Basic Science Boards.

There were several instances where one official referred the letter of inquiry to another official for reply

Of these states, six were completely in favor five were generally favorable with reservations eight

were adverse in their comments.

To obtain an objective analysis of the effectiveness of basic science legislation is exceedingly difficult. Such a problem would probably have to be approached on a statistical basis and an attempt nade to evaluate the numerical trends of cultist licensure both before and after passage of such an act. Such statistics have been available to us for only a few states and even in our own State there is no good way of telling exactly how many individuals claim to be chiropractors.

Dr Reed estimated by the use of classified telephone book insertions under the heading of chiropractors,' that in 1932 there were 1 472 practitioners in the State. From the same sources current esti-mates are between 1 600 and 1 700. As to those estimates, however opinion varies widely monly accepted quotation is 2,000 for the State as a whole and if at some future time it were desired to trace the rate of growth or decline of this cult, it would be extremely difficult in this State to find an accurate base line in the figures which are currently available. Our situation is hardly unique and the reluctance of other states to provide numerical data on the trends in cult licensure most probably stems from a similar paucity of valid evidence

Other Information Gained from the Question naire.-Despite the lack of numerical data, the returned questionnaires yielded facts and ideas which were not specifically requested These were usually found in comments on the questions asked or in the covering letters which accompanied the answers

Quite a few boards of basic science examiners are troubled by the problem of reciprocity Uniformity of medical practice acts sufficient to permit reciprocal licensure has, in many states, been difficult to achieve. The additional requirement of a basic science certificate has, in so far as entering physicians or returning current medical graduates are concerned, been one additional administrative hurdle that appears to be unnecessary since these individuals have already passed a state board or national board examination in the same subjects. Variations in the subjects included among the basic sciences has also proved to be a major obstacle.

Two other factors appear to be of considerable value in keeping down cult practitioners. One of these is the use of injunctions whereby it becomes necessary only to demonstrate to a judge the illegal nature of a defendant a practice in order to restrain him effectively from such practice rather than having to submit a case to a jury. The other procedure which appears to help the situation is the investiture of the state Boards of Medical Examiners either than the state Boards of Medical Examiners either the state Boards of Medical with actual or with unstated but generally accepted legal powers to investigate and prosecute violaters

of medical practice regulations.

In addition to discussing these problems in the replies from several states we were cautioned specifically against attempts by the cultists to attenuate the force of a basic science law by jokers, crip-pling amendments, and exceptions. Cultists avail themselves of these devices at every possible oppor

tunity and these practices are still attempted even in those states which have had a basic science law for a considerable period of time. Where cults do not have adequate political power to tamper with a state a medical practice act they have apparently been able to master sufficient votes to render a basic science law entirely unworkable or to so hamper its execution as to render it virtually worthless. amination of the reports of the Division of Legal Medicine and Legislation of the American Medical Association as published in the Journal of the Amer ican Medical Association for any one-year period, will reveal numerous attempts of this nature.

With such facts as are available from those states having basic ecience legislation we now turn to an examination of the current cultist problem in New York State. Since 1907 all those who wish to treat patients by any method of healing have been required to be licensed under the Medical Practice Act by a single examining board All physicians

are, of course, so licensed

Every year bills to legalize the practice by chiropractors are introduced and every year the propo-nents of a basic science law suggest that enactment of this legislation is the best way to meet the problem. They claim that a basic science law markedly decreases the number of cultists obtaining licenses and aids in the prosecution of those practicing illegally since a clear-cut case of practicing without a basic science certificate can be substituted for the charge of practicing medicine without a license. It is further claimed that since chiropractors are not ourrently licensed it will be necessary for all of them to take basic science examinations in order to qualify for licensure should a chiropractic licensing act be passed This would virtually guarantee failure to obtain licenses by a very large percentage of those

currently gracticing
Actual operation of this law, however has made some individuals working with it less optimistic as to its beneficial effects. Here in New York, where the question is still under consideration and where cults have never been licensed it is necessary to in clude the following factors in our review of the mer

A basic science law is an educational requirement preliminary to further examination, and is not, by its nature a qualification for any pursuit.

(a) Thus, if we hope the chiropractors are going to bother to take such an examination we must permit and condone the setting up of a board for chiropractic licensure

(b) If we do not condone the setting up of such a licensing board, the chiropractors still remain un-licensed and still practicing, and the basic science act is an empty piece of legislation.

- (c) If we approve a basic science law and coincidentally a chiropractic board it is conceivable that we shall have to license by waiver all those currently claiming that their occupation is the practice of chiropractic. While it is true that the chiropractors are unificensed and theoretically do not have to be admitted under a waiver, it is highly dubious whether legislation of this nature could ever be en acted without such a provision Finally one must. in reality, assume that if the chiropractors muster sufficient political power to pass a licensing act for their cult, they will be able to have included a walver clause which will regularize the practice of those cur rently egaged in this occupation
- It should also be observed that passage of a hasic science law would not mean an end to the con-tinuous lobbying by the cultists. They would press

each year for continuity wider areas of practice, and it is highly debatable whether a change of the issues such as this would represent is to be desired when contrasted with the present state of affairs in which these cultists are still in the position of being illegal practitioners, and no opportunity is offered by displaying a "basic science certificate" for intelligent persons to be deceived into believing this to be a license to practice a special cult of healing

Nevertheless, despite all its drawbacks, basic science legislation does have a place of importance Its value might well be proved as an effective rearguard action, if passed concurrently with or immediately following a chiropractic licensing act such an unfortunate event should come to pass, the experience of other states indicates that basic science requirements are an effective method of controlling the flood of newly arriving cultists, but no evidence can be found for the viewpoint that a basic science act is either a useful preventive or an effective controlling mechanism in the handling of the cult problem in a state which has a single licensing board for practitioners of the healing arts

Conclusion —In view of the above considerations. the following recommendations are made

That the Medical Society of the State of New York should not sponsor a basic science law

(a) It should be noted here that the basic science laws were enacted to cure the evils resulting from licensing cult practitioners In New York State as of the date of submitting this report, the initial mistake of licensing cultists has not been made

That the Council of the Society take such action as is necessary for the wide popular distribution

of this report

PART XI

Contract with Kings County Medical Society

The Council Committee on Contract with Kings County Medical Society, consisting of Dr Charles D Post, Chairman, Dr James R Reuling, and Dr F Leslie Sullivan, submits the following report

The Committee on Contract with Kings County Medical Society was created for the purpose of offering a solution of the controversy existing between the Publication Committee of the Council and the Medical Society of the County of Kings by reason of this contract

Under the provisions of this contract, the Medical Society of the State of New York agrees to deliver into the custody of the Medical Society of the County of Kings each and every book, exchange, publication, or other literary medical pamphlet or magazine with convenient speed

The Publication Committee contends that this withdrawal of books and journals hampers the publication activities of the JOURNAL and has requested, masmuch as this contract was entered into many years ago (1904) during which time many changes have taken place, that the Editor of the JOURNAL should be privileged to state to whom books should be sent for review, that the books remain in the hands of the reviewers, and furthermore, that the Editor of the JOURNAL should have ready for reference all journals received for a definite period of six months or a year

These requests necessitate a modification of the contract unless a compromise solution can be found

It is therefore recommended (1) that the existing contract be modified in the following manner "that the editorial staff be given the privilege of choosing any man to review a book, the book to be returned into the custody of the Medical Society of the County of Kings" This recommendation follows the suggestion in Dr Adie's House of Delegates Reference Committee Report on Publications and Medical Publicity presented at the last meeting of the House of Delegates

The Committee recommends (2) that the Medical Society of the State of New York subscribe to such journals as the Publication Committee considers necessary for its editorial use This could be done at

a relatively small cost to the Society

PART XII

Miscellaneous

Nursing Education —The Council Committee on Nursing Education consists of the following personnel W P Anderton, M D, W Guernsey Frey, Jr, M D, Clayton W Greene, M D, and Norman S Moore, M D

The House of Delegates meeting in Buffalo in 1945, in adopting the report of the Council concerning, "the Nursing Problem," recommended the "establishment of an independent coordinating board representing nursing, hospital administration, and medicine, the delegates being authorized, subject to the governing bodies of each representative group, to outline broad policies of cooperation and to study and recommend answers to the following questions in order that nursing in the postwar period may meet the demands of the public, the medical profession, and hospital administrations

When planning for medical and health work in the future, what role should nurses play? Should their role be determined by traditional concepts of the nurse and nursing service, or should these concepts be challenged and a redefinition made of the functions and preparation of nurses in terms of the

needs of society?
"2 To what extent should we attempt to differentiate further the personnel engaged in nursing service and the areas and levels at which they function? What changes in the present system of nursing education would such a revision of boundaries and functions necessitate?

Should all nursing schools on all levels be

^{*} Deceased.

established as real schools, that is institutions that exist primarily for educational purposes and which are provided with the necessary resources and facil ities to perform their educational functions effec-tively? What changes in the present system would be necessary in order to make nursing schools real schools and put them on a sound economic basis?
To what extent should the government be responsi-

ble for maintaining such schools? "4 By what formula should it be determined how many nurses should be prepared in the different categories required for adequate service to the popu

lation as a whole?

5. To what extent should the immediate service needs of the hospitals in which students receive their clinical experience determine the number of

nurses to be prepared?

How should the problem of security for the nurse be met? Should hospitals adopt the annuity retirement system generally accepted in educational matitutions or should this important problem be

solved by other means? The House of Delegates authorized that the Committee on Nursing Education of the Council be given the authority and expanded if necessary to confer with similar groups from the official hospital

and nursing organizations

Pursuant to this mandate representatives of the New York State Nurses Association and the New York State Hospital Association were invited to meet with the Council Committee on Nursing Edu eation on February 20 1047, and at this meeting a Coordinating Council on Nursing Problems was organized with equal representation and voice for each of the three sponsoring groups Dr Frey was elected Chairman, and it was voted that the minutes be kept by the Medical Society personnel, and that the Medical Society offices be the Coordinating Council headquarters

In considering the specific problems referred by the House of Delegates, the conferees recognized that these matters had already been endlessly discussed It was felt however that this Coordinating Council, having behind it the prestige and authority of three great state-wide bodies, would become the official dearing house for questions relating to the nursing profession, and could accomplish much where other independent bodies could only investigate and re-

It was the consensus of the meeting (I) that the nursing care of the sick had several broad aspects hospital care, care in the home and public health nursing (in all its ramifications) (2) that three general categories of nursing personnel should be recognized and defined—the R.N. (and the student nurse) the practical nurse and the ward adds, or nursing aide or semitrained attendant, including the orderly (3) that the practical nurse would find her greatest field of usefulness in carns for the chronicals, ill the aged the convelopments and in chronically ill, the aged, the convalescents, and in general all those requiring practical nursing care, at home or in institutions, (4) that the traditional concept of hospital nursing by R.N. s and student nurses that the converse of the student nurses that the student nurses the student nurses that the student nurses the student nurses that the student nurses that the student nurses the student nurses that t should remain essentially unchanged, but that there should be greater utilization of the services of nurses aides to relieve the trained nurse of the non technical aspect of nursing care (trays, baths, bed pans, etc.), (5) that public health and industrial nursing is the exclusive domain of the R.N

In discussing the training of subsidiary nursing personnel, it was felt that ward aides orderlies nurses aides, etc (the third group) should have no formal program of training, being merely 'broken in" on the wards as they are hired, lest the conviction prevail that such personnel have superior qualifica

Approval was given to the formal training of practical nurses to the end that they enjoy a quali fied professional status. It was pointed out that there is an over-all shortage of practical nurses, and that there are at present far too few training schools for practical nurses. Objection was registered to the training of practical nurses in the same hospitals as R.N 's, but it was felt that there may be many insti tutions which could establish such schools and possibly a few borderline schools which could profitably change from training R.N's to training practical

nurses Despite the feeling of some members of the medical profession that the Registered Nurse is being "overtrained," this Coordinating Council voted not to recommend any lowering of standards in nursing education. It was felt that the ultimate goal should be to have nurses training schools truly educational institutions in which the student paid tuition fees so that the nursing service she rendered would be in the nature of gaining practical experience rather than, as is largely the case at present, working her way through the course. Following some discussion of the exploitation of the student nurse by the hospital, the financial problem of such a program was recognized both from the viewpoint of the hospital and the training school, and of the student It was pointed out that the education of a nurse generally costs more than the value of the services rendered by the student nurse to the hospital that the hospitals have no hold on their graduates who frequently go, immediately after graduation into in-dustrial and public health employment, and that perhaps some plan might be developed whereby in dustry and the community at large would under write some portion of the nurse s education. It was 'Resoled'. That the possibility of making University Scholarships of the New York State

Board of Regents available to students entering nursing training schools, both practical and recistered, having standardized educational programs be explored."

(Such scholarships are now available only to candidates for a Bachelor's degree.)

It was further 'Resolved' That public health organizations, industrial councils, and other community groups utilising professional nursing services be requested to offer scholarships to en-courage qualified candidates to undertake nursing as a career

It was pointed out that nursing should be made an attractive profession, second to none as a means of livelihood for an ambitious young woman No action was taken on the problem of hours and sal aries, as it was felt that these questions were being adequately handled. The matter of security for nurses received considerable attention and it was "Resolved, That this Coordinating Council use

its influence to secure the extension of the benefits of the various Federal and State Social Security Laws to include nurses.'

The Coordinating Council also voted to endorse the program of the American Hospital Association providing retirement benefits to employees of hos-pitals. The matter of voluntary prepaid retirement plans and retirement annuities with the assistance of philanthropic foundations will receive study at some future meeting of the Council.

The nurse delegates called attention to the fact that doctors as a group and as individuals are in a strategic position to interest young women in nursing, and it was suggested that a resolution be submitted to the House of Delegates of the State Medical Society, suggesting that physicians encourage the daughters of their patients in this (Such a resolution is being submitted)

It was voted that this Coordinating Council recommend to the sponsoring bodies that similar units be set up on the local level, the invitations to organize to go from the county medical societies, but the committees so organized to be subordinate only to this Coordinating Council.

At the second meeting of the Coordinating Council on Nursing Problems, held March 20, 1947, besides the regular Council members, two representa-tives of the Practical Nurses' Association of New York were present by invitation

The following definition of a Practical Nurse was adopted

"A practical nurse is a person trained to care for subacute, convalescent, and chronic patients requiring nursing service at home or in institutions, who works under the direction of a licensed physician or a registered professional nurse"

The practical nurse's fee is supposed to be 75 per cent of the professional registered nurse's fee for the same hours, varying as the latter varies in different communities.

The licensing of practical nurses will become mandatory in New York State within a year

Representatives of the Nursing Section of the State Education Department are to be invited to meet with the Coordinating Council on Nursing Problems to discuss the standardization of the training of practical nurses. The conferees were agreed on the desirablility of securing the sponsorship of local Boards of Education, or other educational bodies, for all training schools

The Coordinating Council adopted the following resolution

"Resolved, That this Coordinating Council on Nursing Problems approves the employment of practical nurses for qualified nursing duties, in hospitals, under supervision of a registered professional nurse "

The members of the Council Committee on Nursing Education, as the representatives of organized medicine on this Coordinating Council for Nursing Problems, commend the foresight of the Planning Committee in authorizing the establishment of such a body

The spirit of friendly cooperation, eagerness to compromise conflicting viewpoints between the various groups, and the total absence of any spirit of antagonism between even the R.N's and the practical nurses are impressive signs auguring great possibilities of accomplishment for this council

In submitting this progress report, the Committee requests the approval of the House of Delegates for its proceedings and recommendations to date, and it asks to be continued with the full prestige of the Medical Society of the State of New York behind it.

Memorials

DR. KIRBY DWIGHT

WHEREAS, the Medical Society of the State of New York has suffered a grievious loss in the death of Dr Kirby Dwight, and

WHEREAS, he had long been an arduous worker for the interests of the public and of the medical profes-

Sion, and
WHEREAS, his ability had been recognized by his election as President of his County Society, for several terms as Treasurer of the State Society, and recently as Trustee of that Society, and

WHEREAS, his wisdom, ability and kindliness will

be sorely missed, therefore, be it

Resolved, By the Council and the Board of Trustees of the Medical Society of the State of New York, that it deeply regrets the passing of Dr Dwight, and be it further

Resolved, That this resolution be spread upon the minutes and a copy sent to his family, and published in the New York State Journal of Medi-

DR. WILLIAM HALE

WHEREAS, in His wisdom Almighty God has called from our midst, William Hale, our respected

and admired President, and
WHEREAS, Dr Hale's sudden death at the height
of his term of office, has left a gulf of sorrow among
his fellow officers, Councillors, Trustees, members, executives, and employees of the Medical Society of the State of New York, and

WHEREAS, our loss is shared with the members of his family, therefore be it

Resolved, By the Council and Board of Trustees

that this expression of bereavement be spread upon our minutes and published in the New York STATE

JOURNAL OF MEDICINE, and be it further Resolved, That a copy of these resolutions be sent to Mrs William Hale as an expression of deep sym-

pathy for herself and her children

DR. F LESLIE SULLIVAN

WHEREAS, Dr Frank Leslie Sullivan was called from our midst on February 15, 1947, after a few months of painful illness, and,

Whereas, Dr Sullivan was a much loved, skill-

ful surgeon, and

WHEREAS, Dr Sullivan had proved himself, through many years of devotion to organized medicine and through able contributions to the welfare of the public and his fellow practitioners, and

WHEREAS, his demonstrated ability as a thoughtful leader in the Council and House of Delegates of the Medical Society of the State of New York, and his endearing personality, has made his loss deeply

mourned by his many friends, therefore, be it

Resolved, That the Council and Board of Trustees of the Medical Society of the State of New York records with deep regret the death of Dr Sullivan and expresses its deep sympathy for Mrs Sullivan and the members of Dr Sullivan's family and directs that these resolutions be spread upon the minutes and that a copy be sent to Mrs Sulivan

ABSTRACTS OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

At its meeting on March 13 1947 the Council considered various matters, taking final action or directing further study and reports as indicated under the following headings.

Secretary's Report

Remission of State Assessments -The remission of State assessments was voted on account of service with the armed forces for eight members in 1947 five in 1946 two in 1945 one in 1944 1943 1942 and 1941 also on account of illness for Drs Ludwig Fischl Alfred G Forman, Augustus W Hengerer James H. Heyl, Abbott T Hutchinson, Carones W Lieb Salvator G Marayentano and Nathan Schuts The refunding of dues for one member was author ized.

Meetings.—On the evening of the last Council meeting, your Secretary represented the Society at a dinner given by the American Foundation of Tropical Medicine, Dr. Thomas T. Mackie of Winston-Salem North Carolina, president.

Winston-Salem Forth carolina, presidents.
On February 25 your Secretary attended the meeting of the secretaries of the County Societies Legislative Committee at the Hotel Ten Eyek, Albany I have also attended your committee meetings and answered correspondence

Deaths.—On February 16, it was my sad duty to attend the funeral of the late Dr F Leslie Sullivan at Bootia. Our Society was also represented by Drs Mellen Kenney and Hannon Mr Anderson, and Dr Philip Allen of the House of Delegates The Medical Society of the County of Schenectady and the local American Legion Post were well represented

Communications -A letter has been received from the Medical Society of the State of Pennsylvania, to the effect that Dr Elmer Hess of Ene, Pennsylvania, will represent his Society at our Buffalo meet-

Letter from American Social Hygiene Association, Inc., February 11 1947 thanking the Society for sponsoring their meeting on February 5 1947 and requesting sponsorship of their next annual meeting, to be held February 4 1048.

It was voted that the meeting be sponsored. Letter from Mr George H. Sibley chairman of the Committee on Medical Jurisprudence of the Assodation of the Bar of the City of New York, dated February 19 1947, requesting that we nominate a member to join their Committee

It was poicd that the President be delegated this

*ppointment

Letter dated March 6 1947 from Hackeling & Oberkirch certified public accountants, re estimated iee of \$200 for auditing books and records of Veterans Medical Service Plan of New York, Inc.

It was roted that the Council recommend to the Trustees that they consider this estimate and

that the fee be paid

Letter from Dr Joseph C O Gorman, chairman, Workmen's Compensation Board, Medical Society of the County of Eric regarding bill introduced in the State Legislature which would amend Section 13-6 (2) of the Workmen's Compensation Law to permit hospitals to employ roentgenologists on salary

The following reply was sent by Dr O Gorman

by Dr Bauer

Thank you for your letter of March 3
"We have investigated the matter and have found that
the bill which you mention has been introduced in the

State Legislature. The State Society will actively oppose the snactment of this legislation. I am likewise bringing the matter to the attention of the Council at its meeting proposition, however has been started at once as the Council meeting would be too late to do any thing effective.

It was roled to approve Dr Bauer's letter

Treasurer's Report Was Accepted

Report of the Executive Officer

Dr Hannon reported verbally as follows

The legislative session is drawing to a close and a record number of bills have been introduced this We have been anxious about two bills per taining to the licensing of chiropractors. The Sant-angelo-Noonan Bill has been rejected in the Senate the Soclye-Coville Bill has been rejected in the Assembly

' Several bills that we were interested in have been amended, and not along the lines we would like. The bill that we introduced for the Grievance Committee, which would amend the law concerning drug mittee, which would amend the law concerning drug addiction and advertising in the newspapers passed the Senate, but was killed in the Assembly Committee on Education. The corresponding Assembly bill was amended by Mr Milmos so as to allow newspaper advertising which is one of the things we wanted prevented. This amended bill is now in the Rules Committee.

The Tershin Bill that we approved concerning

partnerships was killed in committee

"The Clancy \ ray Bill has been amended and now provides that any person, firm, association, or corporation that has been practicing x ray for five years may continue to do so In other words, it will not block any of those that have been doing such work for five years

"Also the Medical Bureau Bill, which formerly stated that employers might have a medical bureau that was approved by the Workmen a Compensation Committee of the County Society has been amended so that license provision approval by the County

Society has been stricken out

The bills that were introduced by Senator Griffith and Mr Milmoe, the so-called Senate Int. 740 741 and 742, which pertain to partnership and group practice under insurance by nonprofit organizations, have been passed in the Senate and are on third reading in the Assembly It looks as if they will pass If we are to block these bills—and we have gone on record as being opposed to them—we will have to make our representations to the Governor"

It was roted that the report be accepted

Activities of Committees

Committee on Legislation.-Dr Aranow, Chair man, reported that most of the legislative matters man, reported that he were included in Dr. Hannon s report, but that he wished to say that the meeting held on February 25 of the County Legislative Chairmen was interesting and well attended. All bills were thoroughly dis-cussed, and acted upon He thanked Mrs. Grimm for an excellent record of the minutes and Mr Anderson

for his fine help and cooperation.

It was brought out in discussion both by Mr Anderson and Dr Hannen, that the importance of the Legislative Committee in county societies has not been sufficiently emphasized, and that the constituent societies should be educated along those

lines.

Malpractice Insurance and Defense Board -

Kenney, Chairman, stated

"There were referred by the House of Delegates to the Council, and from the Council to the Malpractice Insurance and Defense Board, two resolutions introduced by Bronx County, for our study and recommendations

"We have met on four occasions and have given these resolutions considerable study and herewith present our recommendations"

"WHEREAS, the Bronx County Medical Society is concerned with the final disposition of suits brought against its members for malpractice, therefore, be it

"Resolved, That the House of Delegates direct that the Medical Society of the State of New York through its Counsel submit a report to the Comitia Minora of each County Medical Society on the number of members insured in the Group Plan in said county, number of suits in said county (against insured, against noninsured), number of suits dropped, number of suits settled and amounts, and the number of judgments and amounts"

"If approved, this resolution would require setting up in the office of the legal counsel or indemnity representative an additional and entirely new accounting system whose only use would be to furnish the proposed reports In all liability insurance accounting, suits and claims reported and the cost of disposing of them are charged against the policy years involved and not against the calendar years in which they are filed or settled Thus, during any one calendar year, the suits and claims filed and those disposed of pertain to as many as five or six policy years and this system cannot be altered need for the information called for by this resolution were great enough, it might be worked out on a state-wide basis at considerable cost But if the information had to be divided between 61 counties, the task would be difficult and the expense nearly prohibitive

"The Board points out that a report in great detail covering the Society as a whole but in an entirely different form is being furnished the Board annually and has been furnished each year since 1924

"There are a number of the smaller counties in which there have been few, if any, suits over a number of years. This fact is meaningless, however, from an insurance standpoint because insurance is based on the law of averages which does not apply to the loss experience of any small group an individual, the loss experience of a small group when considered alone becomes a matter of chance or luck which is a gamble Thus, a small group might luck which is a gamble Thus, a small group might have no losses for a long period of time but on the other hand it might have one or several losses in quick succession which, insurance-wise, would put it in the red for many years Yet if the lack of suits in any one county was brought to the special attention of the comitia minora of that county, it might create a great deal of unjustified dissatisfaction

"Although the representatives of the Bronx County have stated that they do not want the names of the sued members given or identified in any way, it is obvious that detailed information as to suits filed and settled in many of the smaller counties would point unerringly to the doctors involved whether their names were given or not and might do

irreparable harm to them

"In the opinion of this Board the most important objection to this proposal is that it would give publicity to the number and cost of suits lost or Since the inception of the Group Plan settled

twenty-five years ago it has been the fixed policy of the Society to give out no information whatever concerning such suits to anyone except the members of the Committee on Malpractice Defense and Insurance and officers of the Society After careful consideration that policy was reaffirmed at the first meeting of this Board on October 24, 1946, in the following resolution

"WHEREAS, it is believed that it is not in the best interest of the Medical Society of the State of New York and the general welfare of its members to permit any publicity as to suits and claims against members which are lost or settled out of

court, and
"'WHEREAS, such publicity can serve no useful purpose but, on the contrary, will provoke harm and suffering to the various defendants and will provide ammunition for unfriendly individuals to

use against members of the Society,

"Now therefore be it resolved, That the relationship, with respect to such suits and claims, between the insurance company carrying the Group Plan and/or the Society and its members must at

all times be assumed as confidential?

"After consideration of these factors the Board was unanimously of the opinion that the dissemination of this information would be contrary to the best interests of the Society and recommends to the Council that the referred resolution be disapproved Board further recommends that if authorized members of any county society desire special information regarding the situation within their own society, applications for such information should be filed with this Board which, in so far as is consistent with the policy of the Society, will endeavor to supply the required data "

After discussion

It was voted that approval be given the Board's resolution which disapproves of the original resolution introduced in the 1946 House of Delegates

"Whereas, The Bronx County Medical Society considers inequitable the present arrangement for the payment for Malpractice Defense of members of the Medical Society of the State of

New York, therefore, be it "Resolved, That the House of Delegates of the Medical Society of the State of New York direct that a separate and distinct fund be established for the sole purpose of meeting counsel fees in the defense of all malpractice suits against members of the Medical Society of the State of New York."

"The Board has given careful consideration to this proposal and reached a unanimous conclusion regarding it as set forth in the approved minutes of the meeting of the Board held on January 7, 1947, as

follows

"The purpose of this resolution is to distribute the cost of all legal defense to all members in order to eliminate that cost from the operation of the Group Plan of malpractice insurance and defense and thus reduce the cost of insurance to insured members It is pointed out by Bronx County that at present insured members pay the same dues as uninsured members and that some part of their dues is allocated to the defense of uninsured members and that this is mequitable "

After thorough consideration of all the elements involved, the Board unanimously agreed to recommend to the Council that this resolution be disapproved

for the following reasons

(a) The annual cost of defending uninsured members is an exceedingly small part of the cost of the Society's legal service, and thus absorbs an insignificant part of the membership dues Therefore the inequality of the present arrangement, if there be any can hardly be of any real importance to any

member

(b) There are in the Society an Indeterminate but large number of members who are not in the practice of medicine in circumstances which make them liable to malpractice actions Such members have no need for malpractice insurance or legal defense yet they pay the same dues as members in private practice, and thus contribute to the maintenance of defense service for which they have no need If this resolu tion were approved it would penalize such members by increasing their dues to help pay the cost of defense of insured as well as uninsured members. This would certainly be inequitable and it is not believed that one inequality should be cured by creating another

(c) The Society would if this resolution were approved undertake to pay the cost of the defense of suits insured by a private insurance company and the legal counsel is of the opinion that the Society would not be permitted to use any part of its funds

for such a purpose

(d) It is believed that the State Insurance Dopartment would not approve such an arrangement and it is not believed that any reputable insurance company would undertake the Group Plan of the Society on that basis.

After discussion. It was roted that the Board s recommendation of

disapproval be approved Dr Kenney reported further

'At the meeting on February 18, 1947 the indemnity representative submitted to the Board the annual statement and tabulation of the cost of operating the Group Plan for the eleven years end-ing December 31 1946 which was studed in detail by the Board The indemnity representative pointed out that the upward trend of costs noted at the end of 1945 had continued and that due to the increase in the cost of disposing of suits, the reserves previously established for them had proved inade-The legal counsel presented a verbal report quate. The legal counse presumes in cost. He reas to the reasons for the increase in cost. He reasons for the increase of negligence and ported that the cost of all forms of negligence and liability cases had increased greatly due largely to the depreciated value of the dollar and that in addition contain absorpts in local procedures in New addition certain changes in legal procedures in New York making hospital records and defense testi mony available to plaintiffs before trial had added substantially to the difficulty of defending malpractice actions and to the cost of disposing of them.

"The Board noted that the cost of minimum limits of insurance (\$5 000/\$15 000) for the period had risen to \$32,56 but that some further economies in the expense factor had been worked out with the Yorkshire which in effect brought the computed rate Therefore in accord down to approximately \$32 ance with the long established agreement with the arrier of the Group Plan, the Board decided to recommend to the Council that it approve an in crease in the base rate from \$28 to \$3? Accordingly the following the following resolution was unanimously adopted

WHEREAS the Malpractice Insurance and Defense Board finds that the cost of the basic limits of insurance in the Group Plan of the Medical Society of the State of New York has increased to

\$32, and Wheneas under the long established agreement with the carrier of the Group Plan the Society is called upon to adjust its approved rates from time to time in accordance with the developed cost of insurance now therefore be it

'Resolved That the Board recommends that the Council approve an increase in the base rate from \$28 to \$82 for all new and renewal policies of insurance issued on and after May 1, 1947 and that the rates for all higher limits of insurance as well as for cosmetic plastic surgery and for members in the armed forces be adjusted accordingly ' After discussion.

It was roted that the recommendation be approved

Committee on Medical Publicity -Dr Winslow Chairman stated that the report distributed with the agenda is as follows

News releases were sent to newspapers in the counties of Richmond Jefferson St. Lawrence The subjects were Teach Tompkins, and Nassau ing Days and other educational events sponsored by the Committee on Public Health and Education

'Mr Anderson had a conference with Mrs. Mad den about cooperation with the Woman s Auxiliary 'Mr Anderson, Mr Walsh, and Mr Cook attended the Legislative Committee meeting in Al

bany on February 25

"Mr Cook and Mr Walsh toured the lower and upper tiers of the State to promote public resistance to the Seelye-Coville Bill to license chiropractors. County organizations and Woman a Auxiliaries received assistance in this work among groups of citizens. Such groups included Chambers of Commerce, civic, fraternal and service organizations as well as county registered nurses organizations. well as county formers in the control of Education. Effective use of persons in Boards of Education. Effective use of personal acquaintance with legislators was made As a result of these trips and the Legislative Committee meeting, large quantities of material on the Seelyo-Coville Bill have duantities of inaction on the object of the last two weeks. Two pamphlets "Can Chiropractic Curol and "Medicine Men and Men of Medicine" provided an informative basis for public opinion, and post cards and handbills marked "Urgent' gave the means for contacting their legislators.

'In addition, two News Letters dated February 24 and March 4 were mailed to the Bulletin list, ' Committee on Nursing Education.—Dr Frey re-

ported as follows

The 1945 House of Delegates, in adopting the report of the Council Committee on Nursing Educa tion, directed that an invitation be sent to repre-sentatives of the Hospital Association of New York and the New York State Nurses Association to meet with the Council Committee on Nursing Education to form a Coordinating Council to take up nursing problems.

"The first meeting of this group was held on Febmary 20 with representatives of the New York State Nurses Association the Hospital Association of New York, and the Council Committee on Nursing Edu cation. Certain actions were taken at that meeting.

It was cold that Dr Frey be Chairman of the meeting, that a Coordinating Council on Nursing problems be set up not controlled by any of the sponsoring groups, the delegates to report back to their respective organizations, that the minutes be kept by the Medical Society personnel and that the Medical Society Office (292 Madison Avenue, New York City) be the headquarters of the Council.

There were certain specific problems posed by the House of Dolegates, as presented in the Planning Committee s report, which were discussed

"In the discussion, it was recognized that those problems had already been endlessly discussed and

that this Council would accomplish no more than its predecessors unless there should be brought forth recommendations for action

"It was the consensus of the meeting

"(1) that the nursing care of the sick had several broad aspects-hospital care, care in the home, and public health nursing (in all its ramifications),

"(2) that three general categories of nursing personnel should be recognized and defined—the R N (and the student nurse), the practical nurse, and the ward aide, or nursing aide, or semitrained attendant, including the orderly,

"(3) that the practical nurse would find her greatest field of usefulness in caring for the chronically ill, the aged, the convalescents, and in general all those requiring practical nursing care at home or

in institutions

"(4) that the traditional concept of hospital nursing by R.N's and student nurses should remain essentially unchanged, but that there should be greater utilization of the services of nurse's aides to relieve the trained nurse of the nontechnical aspect of nursing care (trays, baths, bed pans, etc),

"(5) that public health and industrial nursing is

the exclusive domain of the R.N

"In discussing the training of subsidiary nursing personnel, it was felt that ward aides, orderlies, nurses' aides, etc (the third group) should have no formal training, being 'broken in' on the wards as they are hired, lest the conviction prevail that such

personnel have superior qualifications

"Approval was given to the formal training of practical nurses to the end that they enjoy a qualified professional status It was pointed out that there is an over-all shortage of practical nurses, and that there are at present far too few training schools for Objection was registered to the practical nurses training of practical nurses in the same hospitals as R.N's, but it was felt that there may be many institutions which could establish such schools, and possibly a few borderline schools which could profitably change over from training R.N 's to training practical nurses In this connection, Miss Casey mentioned that a joint committee of the six national nursing organizations has been conducting a survey differentiating the levels of achievement of the different groups, a copy of which report is to be re-leased shortly She will send one to each member of this council.

"There was the usual discussion of the 'overtraining' of nurses, but the Council voted not to recommend any lowering of standards in nursing education It was felt that the ultimate goal should be to have nurses' training schools truly educational institutions, in which the student paid tuition fees, so that the nursing service she rendered would be in the nature of gaining practical experience rather than, as is largely the case at present, working her way Following some discussion of through the course the exploitation of the student nurse by the hospital, the financial problem of such a program was recognized, both from the viewpoint of the hospital and the training school, and of the student pointed out that the education of a nurse generally costs more than the value of the services of the student nurse to the hospital, that the hospitals have no hold on their graduates who frequently go immediately into industrial or public health employment, and that perhaps some plan might be worked out whereby industry and the community at large would underwrite some portion of the nurse's educa-

"It was

" 'Resolved, That the possibility of making scholarships of the New York State Board of Regents available to students entering nursing training schools, registered professional and practical, having standardized educational programs, be explored'

"It was
"Further resolved, That public health organizagroups utilizing professional nursing services be requested to offer scholarships to encourage qualified candidates to undertake nursing as a career'

"It was pointed out that nursing should be made an attractive profession, a means of livelihood action was taken on the problem of hours and The matter of security for nurses received salaries

considerable attention, and it was "Resolved, That this Council use its influence to secure the extension of the benefits of the various Federal and State Social Security Laws to in-

clude Nurses '

"The Committee also voted to endorse the program of the American Hospital Association providing retirement benefits to employees of hospitals The matter of voluntary prepaid retirement plans and retirement annuities with the assistance of philanthropic foundations will receive study at some future meeting of the Nursing Council.

"The Nurse delegates stated that doctors are in a strategic position to interest young women in nursing, and it was suggested that a resolution be submitted to the House of Delegates of the State Medical Society, suggesting that physicians encourage

the daughters of their patients in this career

'It was suggested that this Coordinating Council recommend to the sponsoring bodies that similar units be set up on the local level, invitations to organize to stem from the County Medical Societies, but the committees so organized to be subordinate

only to the State Coordinating Council
"It was voted to meet again at 4 00 PM on
March 20, and to invite one or two representatives from the Practical Nurses Association"

It was voted that this report be approved

Planning Committee for Medical Policies —Dr Kenney, reported that the Planning Committee met March 12, at which time two matters were referred One was to make a study of the present Council Committees Recommendations which were presented to the Council were tabled until the next meeting. The other matter was relative to Dr Mitchell's report for the Committee on Public Health and Education at the October 10, 1946, meeting of the Council This was about arrangements between the State Department of Health and the State Society for payment of honorana to speakers on the postgraduate teaching program As this relationship has been going on for many years and the State has merely agreed to continue this work and add a little more to it, the Committee voted that it "approves of the arrangements which Dr Mitchell has made with the State Department of Health regarding its program on postgraduate education '

It was voted that this action be approved Committee on Public Health and Education —

Dr Mitchell reported as follows

Activities of the Chairman "On Wednesday, March 12, 1947, in New York City, attended a meet "On Wednesday, ing of the Planning Committee for Medical Policies On the same day in New York City held a meeting of the Council Committee on Public Health and Education and BCG Advisory Committee to the State Department of Health and the Council Com

mittee on Public Health and Education

The President of the Medical Society of the State of New 1 ork designated tentatively the follow ing physicians as members of the Advisory Committee on BCG to the Council Committee on Public Health and Education and the New York State Dopartment of Health

Milton I. Levine M.D. Chairman, New York Hospital, 525 East 68th Street, New 1 ork 21

Robert A. Ullman M.D 1171 Delavan Avenue Buffalo Edith M Lincoln M.D Bellevue Hospital 26th

Street and First Avenue New York 16 James R. Reuling, M.D., 217-07 40th Avenue

Bayaide It was roted that the above members as designed

by the President, be approved "The New York State Department of Health also nominated four physicians as members of the Ad visory Committee

'Dr Robert Plunkett, Assistant Commissioner in charge of Tuberculosis Control Program Dr Julius Kats who is in the same department as a temporary member Dr Konrad Birkhaug, in charge of BCG preparation and distribution and who has had more experience with it than any other man in this country, and Dr Gilbert Dall dorf, Director of the Division of Laboratories of the State Health Department.

Most of the time was spent in a technical dis-cussion concerning the BCG method of immunization against tuberculosis. At the end it was decided to ask Dr Levine, Chairman, and Dr Birkhaug, after any conferences they may donre, to prepare details of the BCG immunisation plan for New York

State

Postgraduate Education. Postgraduate instruction has been completed in Chemung and Oswego County Medical Societies. Instruction is now being tiven in Chenango, Clinton, Cortland, Fulton, Jefferson Nassau Otsego Richmond Rockland, St. Lawrence, Sullivan, Tloga, and Tompkins County medical societies. Arrangements have been completed for a postgraduate lecture to be presented before the Schenectady County Medical Society in May 1947 A request has been received from the Broome County Medical Society for a Cancer Teaching Day in April. The Clinton County and Cayuga County medical societies have indicated a desire for postgraduate lectures in the fall of 1947

At the request of the Convention Committee, a teaching day has been arranged on Tuceday May 6 1947 during the Annual Meeting of the Society

Committee on Public Relations and Economics. As Dr Werts, Chairman was absent, Mr Farrell Director of the Medical Care Insurance Bureau reported as follows

"Your Director has attended the meeting of the Liaison Committee and Veterans Medical Service Plan, and the meeting of the Chairman of the County Legislative Committees at Albany Also he has conferred with Dr Aaron regarding the annual report of the Medical Care Insurance Bureau

"On Tuesday, March II your Director addressed the Physicians Guild of Kings County on the cost of medical care as experienced by New York State Medical Care Plans. The information and data presented were compiled from the reports now being submitted by the plans, which enable a definite con

clusion to be reached regarding the cost of medical care based on experience and not theory. Much interest was manifested in view of the program recently presented to them by H.I.P. where the doctor is paid on a per capita basis. Dr Aaroh hottler secretary of the Guild stated that they were opposed to the H.I.P. Plan in principle and he desired to know whether or not the State Medical Society had aproved or disapproved the H.I.P Plan

After discussion

It was voted that the Council go on record again as opposing the Milmoe Bills Senate Int 740 741 and 742, and that Dr Hannon be instructed to oppose them to the Governor if they are passed by the Legislature, stressing the points that these do not provide what they appear to superficially, but that they open the door to the practice of medicine by corporations other than insurance plans. They also seem to legalize cortain kinds of fee splitting

Subcommittee on Public Medical Care,-Dr Wood, Chairman submitted an interim report on the cooperative efforts of the New York State Medical Society the New York State Association of Public Welfare Officials, and the New York State Department of Social Welfare in developing public medical care programs under the Social Welfare

Law (December 1, 1946)
Introductory Public medical care as administered under the New York State Social Welfare Law has progressed substantially since 1941 when the New York State Medical Society and the New York State Department of Social Welfare adopted seven cardinal principles as the basis for development of such programs.

It was soled that the Council approve this report and recommend that it be published in the

JOURNAL. Publication Committee.—Dr Kosmak, Chairman.

reported verbally as follows

The Publication Committee had its monthly meeting on March 6 and discussed a number of routine matters and editorial content. We are still hampered by lack of paper We are therefore unable to really present in the JOURNAL a satisfactory account of the activities of the Society However we did succeed in getting enough paper to bring out a fairly satisfactory Convention Issue, and trust you will be pleased with it,

I am also pleased to report that the contemplated paper cover for the *Directory* will not be used in stead Mr Anderson has found a binder who will provide a cloth binding at a reasonable figure, much below that of the first estimate I hope the Council and every member of the Society will continue to bear with the Publication Committee.

Committee on Lisison with Veterans Adminis-tration.—Dr Bauckus Chairman, reported verbally

as follows

"I have several things to report relating to Veterans Medical Care Plan. I would like to give you a few statistics which I think should be known From September 16 1946 to February 21 1947 about five months, we have had the following authorisations in four areas. (The authorization is made by the authorising physician of Veterans Administration and he puts down a sum of money that may be ex pended in a given time and that constitutes the figure here.) In the New York area, which takes in the entire metropolitan area and considerable above. I think, including Westchester County there were 37 000 authorizations roughly costing \$1,365 638,

37

'n

and that would average about \$37 per authorization. In the Albany area there were 14,297 costing \$234,-319, and that would average \$16 per authorization In Buffalo we had the largest number of authorizations of any district, which for a time included Syracuse and Rochester, and there were 38,646 authorizations costing \$814,981 or a per capita rate of \$31 plus In Syracuse, which has recently started from February 3 to February 22, we have had 2,516 authorizations at a cost of \$21 plus The total The total amounted to 112,476 authorizations costing \$2,469,-842, and amounting to an average of about \$22 per authorization, which to my mind is very reasonable

"Much of that, or, I would think, about one fourth of these authorizations will not be expended in that This, includes the first four months of operation, when many cases got in for the first time

"You might also be interested in the type of case, for instance, in the outpatient care for a week in Rochester They have had in this week medical, 109, surgical, 14, psychiatry, 68, eye, 10, ear, nose, and throat, 30, dermatology, 32, orthopedic, 86, tropical (diseases commonly incurred in the tropics), 11, urologic, 4, neurologic, 12 That is the

way it works out generally
"Next, I want to report that during the past few
weeks I had a visit from an osteopath, who came to see us about the use of the Veterans Medical Care Plan for taking care of the veterans by means of osteopathy I stated to him that if osteopaths were interested in giving medical and surgical care to the veteran, and the Veterans Administration wanted them to do so, they ought to form their own plan because we were not apt to be informed enough to take care of their plan, too I stated that matter would need to be considered by the Board of Directors, but personally I thought it was entirely up to them

"The third has to do with a very important matter A few days ago there came from Washington a pamphlet, 'Fee Schedule for Medical Services, Veterans Administration.' That is supposed to be the maximum fee schedule in the United States, and I have a letter from Dr Frederick E Lane, who has charge of the Outpatient Department of the Medical Care Plan, in which he encloses a letter received by Dr Von Salzen (Dr Von Salzen is the Medical Director in New York State)

'Attached herewith is a copy of a letter received

by Dr Von Salzen 'I am forwarding this to you, with a copy of the Veterans Administration Form 10-2535a, February, 1947, which is to be the maximum fee schedule for Veterans Administration throughout the

United States 'The fee schedule which we are now employing in New York is higher than this maximum fee schedule in many instances and it will be necessary for us to make some adequate adjustments

I am sending you this letter at this time so that we may be prepared to take it up at the next meeting of the Directors of the Veterans Medical Service Plan of New York, Inc '

We are going to "This came to me on March 3 have a meeting this afternoon on short notice, and we shall try to do what we can.

"This is the enclosure referred to

VETERANS ADMINISTRATION Washington 25, D C February 24, 1947

10DA

"Deputy Administrator
Veterans Administration Branch Office 2 299 Broadway, New York 7, New York

'Attention Branch Medical Director Dear Sir

"Acknowledgment is made of the receipt of your telegrams of February 7 and February 18, 1947, concerning the New York fee schedule We have been working for some time to set up a fee schedule the format of which is sufficiently extensive and complete to fulfill the needs of all State Medical Societies and State Medical Service Organizations participating in the homeown' plan for medical service to veterans. With the cooperation of the Central Office Professional Services and their Consultants we have promulgated such a schedule. their Consultants we have promulgated such a schedule. Veterans Administration has 38 contracts or agreements for home-town' care now in effect. Each format of the se schedules pertaining to these contracts and agreements differs from the others. We request your cooperation in establishing a single schedule format to be used by all medical societies and medical service organizations as a part of Veterans Administration's agreements and contract Also in collaboration with Central Office Professional Services and their Consultants a system of maximum fees has been established. The final figures were arrived at only after exhaustive round table discussion between repreonly after exhaustive round table discussion between representatives of all the various medical specialties. The maximum fee schedule for Veterans Administration in the format discussed above is designated as Veterans Administration Form 10-2535a, February 1947. Copies of this form are herewith enclosed.

("I would like to say at this point that I don't know who these representatives of all the various medical specialties were They did not represent New York State as far as I can determine We knew nothing about this, but their Central Office Professional Services and their consultants are apparently an advisory committee which Dr Hawley used ")

'Adverse comment and criticism have recently been leveled at Veterans Administration for accepting certain fee bids which are claimed to exceed, for the region or community, the fees usually charged persons other than Veterans Administration beneficiants for the same services. It has also been asserted that Veterans Administration accept ance of certain bids for state-wide use has raised fees for the same services above the level previously existing in certain communities of the State. We must so negotiate fee schedules that there can be no basis for charges such as these. There is not the slightest doubt that medical fees paid by Veterans Administration in the operation of the home-town plan are being and will increasingly become subject to the strictest scrutiny. Veterans Administration must be in a position to justify the fairness of every fee bid accepted if 'home-town' medical service to the veteran is to operate to the satisfaction of all parties involved—the veteran patient, the physician, the government, and Veterans Administration. It is urged therefore, that the fees listed in Form 10-2535a, be considered as maxima and that every effort be made to secure the cooperation of The Veterans Medical Service Plan of New York Inc., in conformation to these fee standards.

Veterans Administration Form 10-2535, January 1947, is the duplicate of Form 10-2535a February 1947 (discussed above in the third paragraph) except that the spaces for fees have been left blank. To this form we have transcribed in sextuplicate from the New York fee schedule submitted, those fee bids which do not exceed our maximum for a service, or no bid was made that space was left yeacnt It is requested that The Veterans Medical Service Plan of New York Inc., submit or resubmit bids for these items of the schedule.

When bids have been made for all items on the seven

of the schedule.

When bids have been made for all items on the seven copies of Form 10-2535a, five copies should be forwarded to this office through your Branch Office one copy being retained for file by the bidding organization and one by our office

Your omee

It is strongly recommended that bidding organizations, It is strongly recommended that bidding organizations, in making fee estimates study carefully all notes interpolated in the text of the new schedule Particular attention should be directed to the fact that in the new schedule fees for surgical procedures provide for only fourteen days postoperative care and that additional fees will be allowed (as shown in Items 0013-0022, inclusive) for further postoperative care dressings and visits after fourteen days

"Very truly yours, Paul R. Hawley Chief Medical Director" /8/

"The Veterans Medical Plan, Inc , has a contract with the Veterans Administration, which takes in

the fee schedules you have been working under and I assume that will have to be again changed by agreement if a change is made. However, from the letter I have from Dr Lane—and we propose to meet Dr Von Salzon this afternoon—it appears that they expect we will change to conform to the United States General Fee Schodule.

"I would like to say that in some cases the fees are the same, but in many cases they are reduced. For example the \$10 fee for examination by a specialist the first time is no longer \$10 but it is \$7 50 and the fee for the office call of the specialist after the first visit is \$2 instead of \$5. There is a considerable reduction in some of the surgical fees and special

operations.
"To get some opinion of the men in the field I con sulted a group from the profession in Eric County the other day, and they represented all of the specialties. They were very much opposed to our going along with any change. I have that in a letter, and in personal communication from the members of this Committee

"It was immediately brought up that we have in New York State a workmen's compensation mini mum fee schedule. This Society is in the process of attempting to raise some features in that schedule togive adequate remuneration. The Council approved and accepted the report of our Veterans Plan and the Liaison Committee that we would not agree to go below any of the workmen a compensation rates, and we have faithfully adhered to that. "I have pointed out before that this kind of care

for the veteran is exactly the same as the workmen s compensation for the workers in other fields. He has suffered disability or disease, or had it aggravated in service therefore, he should have care for it. We

feel likewise the veterans ought to have free choice they may go to any physician they like "I would like to say that it is too early to tell how this fee schedule is going to work in actual expense for the period of a year but it seems to me that it not excessive and this represents the authorizating physicians' figures. They may reduce this expense by authorizing for less work than they are doing at the present time. They have a great deal of difficulty that they are the present time. culty because they do not have the personnel to make an examination of the person. They take a little history accept his complaint, and dotermine whether or not the man is entitled to care—he usually appar ently is and he is sent out with this authorization.

I would also like to point out that because of the great pressure of the work we had to step into this quite early, really before we wanted to and we soon found that there were a great number of veterans looking for medical care, and many of them were not

accepting any other

We propose to meet with the Veterans Ad ministration this afternoon, and what will come of that meeting I do not know but we are confronted here with a very important matter one relating to the workmen a compensation fee schedule. Shall we go along with this or not if they decide that we will have to adhere to the new schedule? I would like to point out that each time a physician sends in a bill he states that the fees charged are the same as he charges his private patients, and that they are no more. We have found that the doctors adhere to that quite well. There are exceptions, but many send in a bill that is less than they could have had, and less than had been designated by the author-

ixing physician. Also many of them do not use all of the treatments. We think there is an argument to this plan that in some localities the fees may be too Well if it is the standard of the man to charge lower than that we expect, he will put it down but to make it a maximum schedule and have it as low as they propose would create a great deal of

I would like to point out that for years the Veterans Administration has taken care of these veterans by sending them to veterans hospitals and also by having physicians make these bids (I don t like the term bids' here), and for years these physi-cians have been treating cases under contract at a very low rate. That may happen again, and we should decide after thinking about it quite a bit, what we are going to do and what will happen if we refuse to go along

The report was discussed, but no action taken as it was felt that the Council would be in a better position to act after the Board of Directors had

their meeting

Woman's Auxiliary -Dr Reuling, Chairman of the Advisory Committee to the Woman a Auxiliary presented a detailed report of the recent activities

of the Woman s Auxiliary

Committee on Workmen's Compensation.—Dr Dattelbaum, Chairman, called on Dr Kaliski to report verbally Senator Fino and Assemblyman Archinau introduced legislation according to the mandate of the House of Delegates for the discon tinuance of the medical practice committee having jurisdiction in the four counties in Metropolitan New York. The bill giving the Chairman of the Workmen's Compensation Board sole discretion in appointing specially qualified physicians on a fee basis or a salary basis has passed both houses as it did last year. It was vetoed by the Governor last year and the necessary steps have again been taken to bring our point of view to the attention of the Governor reciting the dangers inherent in this bill which accrue from giving to a State appointed officer the right to make appointments without any professional qualifications or professional control

New Business.—The Council confirmed the appointment by the President of Dr William E. Aying Syracuse, as representative to the A.M.A. Conference on the Cooperation of the Physician in the School Health and Physical Education Program October 16 and 17 1947 Chicago and voted that his expenses in attendance at this conference as the representative of the State Society be recommended

for payment by the Trustees

As a result of the request from the State Department of Education the names of Dr Edward S. Rimer New York City, and Dr Clarence P. Thomas, Rochester were approved as submitted as nominations for selection by the Board of Regents for membership on the Medical Grievance Com-

Dr Edward C Titus, New York City and Dr Francis E. Fronczak, of Buffalo were approved for recommendation to the A.M.A. for Affiliate Fellow Both are retired members of the State ship

Memorial Resolutions.—Resolutions on the deaths of Dr William Hale and Dr F Leslie Sullivan were presented, and appear under Additional Report of the Council—Memorials' in this issue of the JOURNAL.

MEDICAL NEWS

Annual Meeting of Psychosomatic Society

THE fourth Annual Meeting of the American So-Liety for Research in Psychosomatic Problems will take place on May 3 and 4 at Haddon Hall, Atlantic City

A scientific session will be held Saturday morning,

May 3, and the Annual Dinner will take place that

A panel discussion will be conducted Sunday morning The Society will have Dr James L Halliday of Scotland as one of its guest speakers.

Schering Adds to Research Grants

AN ADDITIONAL number of grants for endo-crine and pharmacologic research studies have been awarded by Schering Corporation to research foundations, and medical and pharmacy colleges

The following have been awarded in the State of

New York
Dr Bernard A Watson, director of the division of medicine at the Clifton Springs Sanitarium and Clinic, Clifton Springs, will supervise studies of the daily excretion of 17-ketosteroid group and its relation to the clinical use of the male sex hormone

Clinical studies with oleander glucosides in cardiac

patients will be conducted at Cornell University Medical College, New York, under the supervision of Drs McKeen Cattell and Harry Gold, professor and associate professor, respectively, of pharmacology

Funds were allotted to continue studies on hyaluroudase at the Jewish Hospital of Brooklyn under the direction of Dr Charles Birnberg, and to Cornell University, Department of Zoology, Ithaca, New York, under the direction of Samuel L Leonard, associate profess for zoology

Merck Establishes \$100,000 Fellowship Fund to Further Scientific Research

ONSIDERABLE interest has been aroused in scientific research circles by the recent announcement from the headquarters of the National Research Council of the establishment by Merck & Co, Inc, of a fund of \$100,000, with the National Academy of Sciences, for the creation of fellowships in the natural sciences

These Merck Fellowships, which are designed to

inspire young scientists in their research activities, are open to United States citizens who have demonstrated unusual talent for experimental research and who already have acquired training, in either chemistry or biology, equivalent to that represented by the degree of Ph D. Annual grants under these Merck Fellowships will range from \$2,500 to \$5,000, depending upon individual circumstances

Staggering Costs Seen from Syphilis

HE cost of treating syphilis among veterans of THE cost of treating syphins among World War II in the next twenty-five years was estimated at \$328,000,000 in March by a Veterans Administration official

At a conference of the American Social Hygiene Association in New York City, Dr Bascom Johnson

Jr, assistant chief of the dermatology and syphilology section of the VA, said this "staggering" figure could be reduced only by taking preventive action against the disease He reported that the cost of treating syphilitic veterans of World War I had reached an estimated \$82,000,000 by 1940

Personalities

A new appointment to the State Public Health council was announced on March 2 by Governor Dewey

The Governor appointed Dr Louis Bauer, of Hempstead, to complete the unexpired term of the late Dr Simon Flexner of New York City Bauer, president of the State Society, is also a member of the board of trustees of the American Medical Association and president of the Nassau County Medical Society *

At the February meeting of the Board of Trustees of the American Medical Association, the following physicians of New York State were appointed to represent the Association on allied organizations National Committee on Radiation Protection of the Bureau of Standards, Dr H B Williams, New York, and Annual Meeting of the American Academy of Political and Social Science, Dr Charles Gordon Heyd, New York.

Dr William M Sexton, who was discharged from the Army on January 22 after two years' service as a Medical Corps captain, has opened an office for the practice of general medicine and surgery at his home in Utica

General Hospital the modical unit sent overseas by

Dr John N Shumway, of Painted Post announced in February that be has submitted his resignation to Mayor Karl L. Gaiss, after serving forty-nine years as health officer of the Villager.

The resignation was sent on his eighty-fifth birth day, Dr Shumway said. At that time he was also observing his fifty first anniversary as a practicing physician in Painted Post

In October 1931, Dr Shumway was elected presi

dent of the Corning Academy of Medicine.

Dr Edwin H. Öber has been named to succeed Dr Shumway as village health officer Dr Ober the new ofhcial, is a past-president of the Steuben County Medical Society and has been practicing in Painted Post since June 28, 1929 when he became assistant to Dr L. A. Thomas *

Dr James J Short, formerly of New York City who for many years was associated with the New York Post-Graduate Medical School and Hospital is now located in Los Angeles. Dr Short is on the faculty of the College of Medical Evangelists as associate professor of medicine and is director of the basic science course in internal medicine offered by the Graduate School of Medicine.

Dr Benedict DeRespinis, of Staten Island who served as a equadron surgeon with the Eighth Air Force in England France, and Belgium, has opened

his office in Dongan Hills.

A voteran of three and one-half years Army service, Dr DeRespinis returned to the States in July 1945 and was stationed at Greensboro North Carolina, until placed on inactive duty last April

During the graduation exercises of the Long Island College of Medicine on February 27, the College paid tribute to one of its graduates, Dr. Edwin G. Zabriskie class of 1897 who was awarded the Alumni Achievement Medal. This award is given to a graduate of the College who has made an outstanding contribution to American medicine. Dr. Zabriskie, acting chief of services at the Neurological Institute of the Columbia-Presbytarian Medical Center in Manhattan was honored on the fiftieth anniversary of his graduation

County News

Albany County

Two x-ray clinics conducted by the Albany County Tuberculosis Association in the spring and fall of 1946 revealed more active cases of heart discase than tuberculosis among the 20 000 persons who submitted to the tests according to Dr R. J Erick son, associated director

Dr Erickson said the surveys disclosed 0.4 of one per cent of Albany County's population is infected with the tuberculosis germ, which he described as

highly infectious.

Broome County

Binghamton Physicians Art Club held an exhibition of paintings on February 24 in the auditorium of the Binghamton City Hospital. Ten members of this newly founded club exhibited paintings which created much interest in a large attendance. Dratter J Alexander is the chalman of the group

The Broome County Medical Society in February voted its approval of the Blue Shield, a nonprofit medical group insurance plan similar to the Blue Cross Plan under which numerous Triple Cities employees are already insured. The Blue Shield provides contractual indemnification for stated types of operations, surgical procedures, treatment for fractures and dislocations, anaesthesia, x-ray diagnoses for surgical cases, and maternity care. It is open to persons in good health under sixty-dive years of age in groups at place of employment only. In order to be introduced into the community, the Blue Shield had to receive the sanotion of local physicians, who brought a year's study of the plan to a close recently when they approved it.*

Bronx County

The regular meeting of the Bronx County Medical Society was held on March 19 Dr Frederick E. Lane, special assistant, Medical Care Plan discussed the Veterans Medical Care Plan. Under the Veteran Physicians Program, Dr A. C Galluccio discussed Procurement and Assignment Dr Charles Halberstam, The Specialty Boards and Dr Samuel Leo, Teciprocity

Asterisk indicates that item is from a local newspaper

Cattaraugus County

On March 13 Dr Clayton W Greene, professor of medicine, University of Buffalo, School of Medicine, in one of a series of postgraduate instruction, spoke before the Cattaraugus County Medical Society on the subject of "Diagnosis and Management of Coronary Arterial Disease"

Chemung County

Dr Frank A. Disney, medical adviser of the Rochester Cerebral Palsy Association, spoke at a meeting held in Elmira in February Plans were discussed by cerebral palsy victims' parents for possible formation of a unit of the association in Elmira All such associations are formed by parents of the victims who hold the only voting power

Dr Disney first described the physical aspects of cerebral palsy and then discussed what could be done for the victims by parents, local organizations,

institutions, and medicine

Chenango County

Dr Frederick N Marty, instructor in clinical medicine, Syracuse University, College of Medicine, spoke on "The Use of Blood and Blood Substitutes and Derivatives" before the Chenango County Medical Society on March 11 This lecture was one in the series of postgraduate instruction given for the Chenango County Medical Society and was presented as a joint endeavor between the Medical Society of the State of New York and the New York State Department of Health.

Cortland County

Postgraduate instruction for the Cortland County Medical Society was given on March 21 at the Cortland County Hospital Dr Irl H Blaisdell, assistant professor of clinical otolaryngology, Syracuse University, College of Medicine, spoke on "Bronchoscopy—General Subject," and Dr Walter F Bugden, assistant professor of clinical surgery (thoracic surgery), Syracuse University, College of Medicine, opened the discussion

Dutchess County

The March Meeting of the Dutchess County Medical Society was held in the Pavillion at Hudson River State Hospital on March 12

Dr Ralph Adams of the Lahey Clinic, Boston, presented a paper on "Diagnosis and Treatment of Empyema, Lung Abscess, and Certain Other Thoracic Surgical Cases" Dr Adams is in charge of thoracic surgery at the Clinic

Erre County

The director of the Division of Surgery at the Mayo Clinic, Rochester, Minnesota, Dr Waltman Walters, warned in February that gallstones are a surgical rather than a medical problem, and should be attended to by a surgeon as soon as detected, before complications result

Dr Walters delivered a paper on surgical diseases of the biliary tract, which includes the gallbladder,

bile ducts, and liver, before 150 persons in the Buffalo Museum of Science

The meeting was sponsored by the Section on Surgery of the Buffalo Academy of Medicine

Dr Walters outlined some of the major surgical considerations in the treatment of these complications, but reiterated that prevention by early treatment was of outstanding importance *

A ten-man committee of the Eric County Medical Society recently unanimously approved, in principle, the proposed consolidation of local health services in Eric County under a single County Board of Health

In a resolution adopted at a meeting in the Society office at Hotel Statler, the committee expressed the belief that the proposed consolidation would "raise the level of public health throughout

the county "

Present at the meeting were Dr Arthur F Glaeser, Society president and chairman of the committee, Dr Nelson G Russell, chairman of the advisory board of the Buffalo Health Department, Dr Roy L Scott, Dr John W Kohl, Dr Daniel E Stedem, Dr A S Dean, district state health officer, Dr William H. Handel, county medical director, Dr Edward B Bukowski, acting health commissioner, Dr Edmund A Mackey, and Dr Daniel C Fisher *

Two steps toward further development of the streptomycin and B C G treatments for tuberculosis were taken on February 7 by the Board of Directors of the Buffalo and Erie County Tuberculosis Association at a special luncheon in Hotel Statler The board took these actions

1 It authorized the appointment of a streptomycin-B C G committee to evaluate the two drugs in relation to treatment and prevention of tubercu-

10818

2 It allocated \$7,000 to the committee for use in the study and to supply treatment to indigent patients *

Fulton County

"The Diagnosis and Management of Coronary Arterial Disease," a talk by Dr Henry Field, Jr, associate professor of medicine, University of Buffalo, School of Medicine, was presented before the Fulton County Medical Society on March 20 as one of the series of postgraduate instruction.

Jefferson County

The monthly meeting of the Jefferson County Medical Society was held on March 15 Dr Walter Modell, instructor in pharmacology, Cornell University Medical College, spoke on "The Management of the Failing Heart"

Kings County

The Medical Society of the County of Kings and Academy of Medicine of Brooklyn held their stated meeting on March 18 Dr Harry Gold, associate professor of pharmacology, Cornell University Medical College and attending physician, Beth Israel

To Counteract Milk Anemia

The infant dietary, based largely upon milk, is rich in most nutritional requirements except the hemopoietic elements. As a consequence, "Milk Anemia often results ARMOUR LIVER IRON and RED BONE MARROW (with malt extract) effectively counteracts this tendency by supplying precisely the missing factors. It is rich in general nutritional and more particularly in blood building substances and therefore forms an excellent adjuvant to infant feeding.

This product is also an ideal nutritional adjuvant and hematimic tonic for older children and adults of all ages. It is there-

fore available in two forms a regular 8 ounce bottle and a special 2 ounce dropper bottle for infant feeding. The adult dose is 2 teaspoonfuls twice daily The dose for children under 15 years old is 1 teaspoonful twice daily The infant dose is 1 to 10 drops daily in milk or water

Liver From the Red Boxe Marrow

Have confid nce in the preparation you prescribe --- specify "ARMOUR"

[Continued from page 898]

Hospital and Hospital for Joint Diseases, discussed 'The Digitalis Glycosides' 'The Normal Electrocardiogram" was the subject of the paper presented by Dr Louis H Nahum, associate professor of physiology, Yale Medical School

There will be a meeting of the Pediatric Section of the Kings County Medical Society on Monday, April 28, 1947 at 8 30 PM at the Kings County Medical Society Building, 1313 Bedford Avenue, Brooklyn, New York. Dr M Murray Peshkin, of Manhattan, will speak on "Allergy in Infancy and Childhood" Childhood '

The medical profession is cordially invited to

attend

Monroe County

Positive programs for alleviating conditions which spread venereal disease, rather than campaigns against the disease, were urged by Dr William A Brumfield on February 10 in two observances in Rochester of Social Hygiene Day

Dr Brumfield is director of syphilis control with the New York State Department of Health discussed "Profit and Loss in V D Control" at the

meeting

Other speakers at the noon meeting included Dr Albert D Kaiser, City health officer, who said the medical problems of venereal disease control have been pretty well solved, and the principal problems now are social and economic, and Dr Joseph P Garen, district state health officer, who urged a coordinated city and county program attacking venereal disease

During the war Dr Brumfield served as a colonel in the US Army Medical Corps, and was assistant chief of venereal disease control. He was consultant in venereal disease control to Supreme Headquarters of the AEF, and served in the same capacity with the occupation forces in Germany *

New York County

The New York Academy of Medicine "proposes to weld together the resources of the 65 major hospitals in New York City so as to make it the center of medical education for the physicians of the nation and of the world," its president said recently George Baehr, speaking at the Academy's centennial celebration, said it plans "a comprehensive program of continuing education which must follow the internship and residency training of all physicians" and which "is distinctly the concern of the Academy, not of the medical schools "*

Throughout the celebration of the Academy of Medicine Centennial, five institutions were held These were Institute on Labrary Methods and Problems-March 11 and 12, Institute on Social Medicine—March 19, 20, and 21, Institute on Public Health-April 1, 2, and 3 The Institute on Medicine Theorem 1, 2, and 3 The Institute on Medicine Theorem 2, 2, and 3 The Institute on Medicine Theorem 2, 2, and 3 The Institute on Medicine Theorem 2, 2, and 3 The Institute on Medicine Theorem 2, 2, and 3 The Institute on Medicine Theorem 3, and 3 The Institute On cal Education will be held on April 16, 17, and 18, and the last will be the Institute on Hospitals, which will be held on April 21, 22, and 23

The Comitia Minora of the Medical Society of the

County of New York approved the following statement submitted by the Special Committee on Hospitals and Dispensaries in reference to Hospital

Publicity policies

"A paramount principle of hospital public relations is the fact that a favorable public opinion of hospitals, either individually or collectively, is tantamount to favorable public opinion toward the whole field of medicine Conversely, an unfavorable public opinion toward either the medical profession or the voluntary hospital system inevitably reacts unfavorably upon the other and jeopardizes public acceptance of the whole con-

cept of voluntary medicine

"Hospital publicity may well be directed to-ward furthering appeals for funds and to influence public opinion to a favorable attitude toward a particular institution Such publicity should be dignified, authoritative, mature, and restrained, but above all, factual It should avoid the promotion of individuals and invidious comparison with other institutions It should emanate only from an authorized responsible officer and should be cleared when necessary through a physician familiar with the subject Naturally, a privileged information should be given to the press "

Niagara County

At the monthly meeting of the Medical Society of the County of Niagara in February, Dr N Sullivan, of Indianapolis, Indiana, spoke on antibiotics, stressing streptomycin The danger in using a dosage of streptomycin which is too small lies in the fact that the organisms develop a tolerance to the antibiotic This tolerance is permanent even though the organism is transferred to a new host. Some of the failures of streptomycin in tuberculosis result from the fact that lesions with poor blood supply are

not reached by the antibiotic

A Clinic Day of the Ningara Falls Academy of
Medicine was held at the Niagara Hotel, Niagara

Falls, New York, on Saturday, March 8

Onondaga County

Dr W E Achilles was elected president of the Central New York Roentgen Ray Society at the annual meeting of the society in January at the Hotel Syracuse

Other officers elected were vice-president, Dr De Lalla, of Utica, secretary-treasurer, Dr

Dwight Neidham, of Syracuse.

The scientific session was devoted to a discussion of advances in diagnosis and treatment of cancer of the chest by Dr Walter Bugden, thoracic surgeon associated with Syracuse University, College of Medicine

Next regular meeting of the society will be held in conjunction with the annual meeting of the State Medical Society in May *

Dr Herman O Mosenthal, professor of clinical medicine, New York Post-Graduate Medical School, Columbia University, spoke on "Insulin in the Treatment of Diabetes" on March 21 This was a one-hour therapeutic conference presented under the auspices of the Onondaga County Medical SoIN CERTAIN MYOPATHIES.

CHOOSE THE AID WITH THE RATIONAL BASIS— MYOPONE

Until little more than a decade ago physicians remained awestruck and bewildered before the problem of treating fibrositis and allied my opathic disorders. Since then however research has increasingly confirmed both the metabolic nature of their origin and the therapeutic value of Vitamin E especially when topically applied in these af fections 2244

Using MYOPONE, a Solvent extracted wheat germ onthment containing vitamin E phospholipids and other factors in two series of myopathic patients. Ant^{2,1} reports rapid and marked symptomatic inprovement, apparently by 'a relaxant effect upon muscle fibers relieving tension and tautness' and thus preventing rather than producing edema, as do the traditional counteriritants and rubefacients.

In one series of 20 cases¹ 'Fifty percent or 10 patients showed marked improvement or complete amelioration 40% or eight patients showed fair improvement. In the other series similar success was achieved ² Both studies report the frequent reversal of pathologic changes and consistent increases in general strength and vigor

For your next myopathic patient why not prescribe MYOPONE—a rational and effective therapeutic and? For further information about MYOPONE write to The Drug Prod

ciety and the Syracuse University, College of Medicine, at the University

The Onondaga County Medical Society met on March 4. Papers presented before the meeting were "What's New in Rh" in two parts (a) "The Mother and the Rh Factor" was discussed by Dr Raymond J Pieri, and (b) "The Baby and the Rh Factor" (Exsanguination Transfusion) was presented by Dr Robert C Schwartz

Dr Charles H Mosely talked on a "Review of Stomach Surgery, University Hospital, 1946" which was followed by a discussion opened by Dr

Arthur B Raffl.

902

The Syracuse Academy of Medicine met on March 18, and Dr Gordon D Hoople spoke on "The Fen-estration Operation" with the discussion opened by Dr Mortimer G Brown

"Advanced Ectopic Pregnancy" was the subject of the paper presented by Dr Karl M Wilson, professor of obstetrics, Rochester University, Medical School, at the meeting of the Central New York Association of Gynecologists and Obstetricians

Otsego County

Postgraduate instruction for the Otsego County Medical Society was given on March 12 with Dr Leslie A. Osborn, assistant professor of psychiatry, University of Buffalo, School of Medicine, discussing "The Recognition and Management of Psychiatric Problems in General Practice"

Queens County

Dr Edward C Veprovsky, of Flushing, spoke on "Highlights of Office Gynecology" at the meeting of the Queens Medical Society in February He is at-tending obstetrician and gynecologist of the Flush-ing, Queens General, and Triboro hospitals *

On February 21 Dr Alexander Wiener, serologist, office of the chief medical examiner of the City of New York, spoke before the Queens County Medical Society on "Recent Advances in the Field of Rh Blood Types and Erythroblastoses"

Rensselaer County

The State's extensive postwar campaign in tuberculosis control will be directed by Dr Robert E Plunkett, of Troy, who in February was elevated to the newly created post of assistant State health commissioner in charge of tuberculosis control *

Dr William E Browne, Boston surgeon, addressed the Medical Society of Rensselaer County in February on "The Reconstruction of the Crippled Hand"

Speaking at a meeting of the Society at the Troy Club, Dr Browne, who is chief of the Second Surgical Service of Carney Hospital, Boston, and professor of surgery at Tufts Medical College, explained the medical process involved in certain hand operations

It was announced at the meeting that Dr Konrad Birkhaug, outstanding authority on active immunization against tuberculosis, by means of innoculation with B C G (Bacillus Calmette-Guerin), was to address the March meeting of the Society

Dr Francis Fagan, president of the Society, pre-

sided at the meeting

St Lawrence County

Dr Walter Modell, instructor in pharmacology, Cornell University Medical College, addressed the St Lawrence County Medical Society on "The Management of the Failing Heart" on March 13

Tioga County

The Tioga County Medical Society attended a postgraduate lecture on March 20 The subject was "Newer Aspects in the Treatment of Arthritis", which was presented by Dr Edward F Hartung, assistant clinical professor of medicine, College of Physicians and Surgeons, Columbia University, and chief of the division of arthritis, New York Post-Graduate Medical School and Hospital

Wayne County

"Dysmenorrhea" was the topic of the postgraduate lecture given by Dr Wesley T Pommerenke, associate professor of obstetrics and gynecology, University of Rochester, School of Medicine and Dentistry, on April 8 before the Wayne County Medical Society

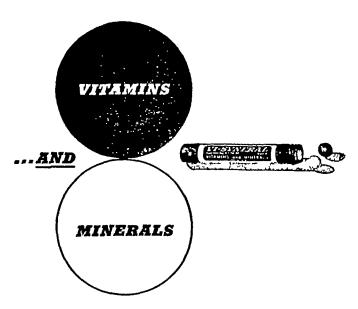

Westchester County

The regular meeting of the Westchester County Medical Society was held on March 18 in the New York Hospital, Westchester Division "The Early Treatment of Injuries" was presented by Dr Clay Ray, professor of orthopedic surgery, College of Physicians and Surgeons, Columbia University, and attending surgeon and director, fracture service, Presbyterian-New York Orthopedic Hospitals

FOR YOUR INFORMATION

The February 14, 1947, Secretary's News Letter from the American Medical Association states in

part
"Diathermy Equipment Frequency Allocation
The Federal Communications Commission has assigned the frequency 2450 megacycles for industrial, medical and scientific purposes for immediate nonevclusive use without a license. The 13, 27 and 40 megacycles are still under consideration Because the excess radiated energy not absorbed by the tissues in diathermy treatment interfered with services, such as police radio, television, and FM, these determinations of allocation of frequency were necessary The Council on Physical Medicine 18 cooperating with the FCC in working out the allocations"

BECAUSE VITAMINS ALONE ARE NOT ENOUGH

Supplementing the diet with both vitamins and minerals is clearly logical because of the now confirmed nutritional concepts originally advanced by Dr. Casimir Funk in 1936

- vitamins and minerals are nutritionally inter-related
- the same causes produce both vitamin and mineral deficiencies (unbalanced diet, pregnancy etc.)
- minerals are nutritionally as important as vitamins

HOSPITAL NEWS

Refresher Course in Medicine to Be Given at City Hospital

ITY Hospital announces that the Spring session of the Refresher Course in Medicine will be given from May 5 through June 6, 1947

The course is a comprehensive review in internal medicine and the allied specialties and is designed to meet the needs of the general practitioner and the medical veteran

Classes are held at the Welfare Dispensary, 80th Street and East End Avenue, on Monday, Wednesday, and Friday mornings, and Tuesday and Thursday afternoons

Emphasis is placed throughout on the diagnosis and treatment of the disorders commonly encountered in general practice. The newer diagnostic and therapeutic procedures are described and evaluated in the light of clinical experience Students are also permitted to make rounds on the medical wards of

City Hospital by special arrangement

There is no tuition fee Requests for application should be addressed to Dr Milton B Rosenblatt, Welfare Island Dispensary, 80th Street and East End Avenue, New York 21, N Y

Memorial Hospital for Cancer and Allied Diseases Extends Its Children's Diagnostic Services

N EXTENSION of the diagnostic service of the A Children's Tumor Registry of Memorial Hospital, New York City, was made on January 1, 1947, with the establishment of the Children's Diagnostic This service is offered to the pediatric patients of hospitals and private physicians for the diagnosis of neoplastic diseases and is available for ambulant or bed cases The investigations will be performed at cost or without charge if the patient is

unable to afford this Upon completion of the study the patient will be referred back to the physician or institution interested, with a report of the findings If therapeutic recommendations are indicated and requested they will also be made

Appointments for such examinations may be made by mail or telephone with The Secretary, Pediatric Service, Memorial Hospital, 444 East 68th St., New York 21, N Y

Newsy Notes

The \$5,000,000 building fund campaign of the New York Infirmary has passed the \$1,000,000 mark, Miss Evelyn Blewett, executive director of the fund, said February 27 at the Infirmary, 321 East Fifteenth Street, New York City *

The affiliation of Columbia University and the New York Post-Graduate Medical School and Hospital will be terminated by mutual agreement on June 30, 1948, officials of both institutions announced February 21 m a joint statement

By agreement since 1931, Columbia University's faculty of medicine at the College of Physicians and Surgeons has supervised the postgraduate teaching program at the Post-Graduate Medical School and

Hospital

Continuation of the plan along the original lines has become impossible because of administrative reasons, it was explained Post-Graduate Hospital, at 303 East Twentieth Street, is far removed from Columbia, and the necessary facilities, laboratories, and clinical services have not been available to carry on the original program *

Demands on the Brooklyn Eye and Ear Hospital have increased beyond its financial resources, the hospital announced March 12 in connection with its current drive for \$54,000 for immediate needs The hospital is the only institution in Brooklyn for the exclusive treatment of diseases of the eye, ear, nose, and throat If a patient cannot afford the moderate fee, he is treated free

* Asterisk indicates that item is from a local newspaper

A bronze plaque bearing the names of 831 persons employed at the Kings County Hospital, Brooklyn, who served in the war, was unveiled March 6 in the main lobby of the institution. The plaque indicated that nine of those named had lost their lives in the war, and 60 of those honored for war service were women '

Utica General Hospital has become the Oneida County Hospital of Utica by unanimous action of the Board of Supervisors, which effected the change February 12

Under the new arrangement, the County will operate the Hospital but the City will maintain the physical properties leased to the County at \$100 a year for two years ending December 31, 1948 *

Mount Sinai Hospital, New York City, opened on March 10 a newly renovated section for patients with psychologic disorders of a type that do not require treatment in a hospital for the mentally ill Expanded outpatient facilities for ambulatory cases of this type have been provided to serve those who do not need to be admitted as inpatients *

The eighth day of February marked the tenth anniversary drive for the ovygen fund of the St Francis Cardiac Guild, and the founding of the St Francis Sanatorium in Roslyn, Long Island It has grown from a small building housing twelve children to the present day with six spacious, modern buildings, given by the Martha Hall Foundation *

[Continued form page 904]

The cornerstone of a \$200,000 building housing a swimming pool for the Kingsbridge Veterans Hospital, in the Bronx, was dedicated Monday, February 3, to the memory of four Army chaplains who were drowned after they gave their lifebelts to four other men when the transport Dorchester was sunk off Greenland by a German submarine, February 3,

The pool, which will include a hydrotherapy center, will be known as the Four Chaplains' Memorial It will be 40 by 180 feet, inclosed in an oval glass shell It is to be completed by summer, in time for

dedication ceremonies July 4

Complete equipment for a 20-bed polio ward at Mercy Hospital, Buffalo, will be provided by the Buffalo & Erie County Chapter for Infantile Paralysis, it was announced in February by John E Clifford, director of organization for the chapter The chapter also will provide the services of two physiotherapists

Besides beds for the ward, the chapter will provide bedside tables, mattresses, three hot-pack machines, an infrared lamp, and other equipment

equipping the polio ward, to be met with March of Dimes funds, will be about \$5,000, Mr Clifford

Consolidation of the Noble Foundation Home in Gouverneur with the VanDuzee Hospital and operation of the home by the Hospital association was approved by the directors of the Stephen B Van-Duzee Hospital Association in February

The change in administration of the home was proposed in a communication from the Edward John Noble Foundation, which also expressed the desire of the foundation to participate substantially in the construction of new hospital facilities in Gouverneur

The 160-bed Horace Harding Hospital, the first hospital to be built in Queens since the war, opened The six-story brick building, at Queens on April 1 and Woodhaven Boulevards, was open for inspection by physicians and by the public March 29 and 30 Two floors of the private hospital are devoted to

maternity cases, two floors to medical and surgical cases, and one floor to children's diseases A kitchen and a restaurant with a 150-person capacity are on the lower floor '

At the Helm

Dr J Hamilton Crawford, director of the department of medicine at Long Island College Hospital, has been elected president of a new medical board at the Hospital, it was announced March 5 elected were Dr S Potter Bartley, vice-president, Dr Lewis A Koch, secretary, and Dr Arthur Goetsch, treasurer

Dr James Bordley III has been named director of the Mary Imogene Bassett Hospital, Cooperstown, to succeed Dr George M Mackenzie Dr Bordley is now associate professor of medicine at the Johns Hopkins University School of Medicine

Dr McKenzie will retire September 1 *

Dr Allen O Whipple, former director of surgical service at Columbia-Presbyterian Medical Center, began his new duties as clinical director of the Memorial Hospital Center for Treatment of Cancer and Allied Diseases, New York City, on March 3

Dr Whipple recently returned from a four-month tour of cancer hospitals and laboratories in Europe He was particularly impressed by the British Cancer Work program in which, he said, vital community statistics are better organized and more accessible than anywhere in the United States

At the time of his appointment to Memorial Hospital last September, Dr Whipple received the Hospital's annual Katherine Berkan Judd award for his development of an operation method to remove tumors of the pancreas

Dr William T Wheeler, who left Oneida County Hospital as chief physician and surgeon October 1, 1944, to enter the armed services, returned to the staff on February 1 He was discharged from the Medical Corps of the Army as a major

Dr Wheeler was connected with the Hospital staff for five years prior to entering service *

Dr William E Garlick, of Wappingers Falls, has been elected president of the medical staff of Vassar Hospital in Poughkeepsie He succeeds Dr_Scott Lord Smith, who retired after heading the staff since 1932 Dr Smith, who recently was elected a trustee of the Hospital, continues service as an attending physician

Dr Emil A. Stoller, an attending surgeon, succeeded Dr Garlick as vice-president of the staff, and Dr Albert A Rosenberg, attending pediatrician, was elected secretary-treasurer of the staff, a post

which had been held by Dr Stoller

In the consulting staff a number of additions have been made Dr Milton J Raisbeck, of New York City, was appointed as a consulting cardiologist, and Dr Alfred C Beck, of Brooklyn, as consulting obstetrician

Other new consultants are Dr Frank B Berry, New York City, thoracic surgeon, Dr Wilfred D Wingebach, Brooklyn, neurosurgeon, and Dr Foster Kennedy, New York City, neurologist Dr Eleanor K Peck, of Poughkeepsie, was pro-

moted from clinical assistant to an assistant attend-

ing pediatrician

Dr Garlick, the new chief of staff, was graduated from Albany Medical College in 1904 He became clinical assistant on the Vassar Hospital staff in 1925, an assistant attending physician the same year, and was advanced as an attending physician in 1940 *

Dr Ray E Persons, of Cairo, was elected president of the Greene County Memorial Hospital staff,

at the annual meeting held by that organization Other officers elected were Dr Kenneth F Bott, Greenville, vice-president, Dr George L Branch,

of Catskill, secretary Other members of the hospital board are Dr Mahlon H Atkinson, of Catskill, Dr T Earl Mc-Quade, of Coxsachie, Dr Alton B Daley, of Athens,

[Continued on page 908]

and Dr Edwin Mulbury, of Windham

Clinical tests conducted by a prominent research organ ization establish its effectiveness; also that it may be used continuously without untoward effect.

4 offered for use under the guidance of physicians, it is supplied to patients through prescription pharmacies in packages containing a large tube of jelly with applicator at \$1.25 Refills without applicator \$1.00

Physicians interested in obtaining complete information on conception control are invited to write for our revised Physicians Manual.

POSTGRADUATE MEDICAL EDUCATION

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the Journal The members of the committee are Oliver W H Mitchell, M D, Chairman (428 Greenwood Place, Syracuse), George Baehr, M D, and Charles D Post, M D

Cortland County "Heart Disease and Major Surgery" will be the topic of a talk by Dr Edwin P Maynard, Jr, professor of clinical medicine at Long Island College of Medicine, at the April eighteenth meeting of the Cortland County Medical

Dr Richard S Gubner, assistant medical director of the Equitable Life Assurance Society of the United States, will speak on "The Interpretation of Various Cardiac Signs and Symptoms" on May 16 These lectures will be given on Friday evenings at

30 at the Cortland County Hospital
Madison County The Madison County Medical Madison County The Madison County Medical Society's postgraduate instruction, given at the Hotel Oneida, in Oneida, on Thursday evenings at 8 30 o'clock, are April 17, "The Diagnostic Approach to Diseases of the Anus, Rectum, and Sigmoid," by Dr John C M Brust, associate professor of surgery, Syracuse University, College of Medicine, April 24, "Medical Problems of the Returned Veteran—Malaria, Hepatius, Amebiasis," by Dr Frank Meyers, assistant professor of pharmacology and therapeutics and associate in medicine University and therapeutics and associate in medicine, University of Buffalo, School of Medicine, and on May 1, "Hemorrhages of Pregnancy," by Dr Francis R Irving, professor of clinical obstetrics, Syracuse Uni-

versity, College of Medicine
Sullivan County "Chinical Manifestations of
Coronary Artery Disease" will be the subject of a
lecture to be given by Dr Edward C Reifenstein, professor emeritus of medicine at Syracuse University, College of Medicine, on April 16, at Workmen's Circle Sanatorium, Liberty, New York

Dr Frank Glenn, associate professor of clinical surgery at Cornell University Medical College, will speak on "Surgical Treatment of Biliary Tract Disease" at Monticello Hospital, Monticello, on April 23

On April 30 Dr Wardner D Ayer, professor of clinical medicine at Syracuse University, College of Medicine, and director of medicine at the University Hospital of the Good Shepherd, Syracuse, will give a talk entitled "A Critical Review of Therapeutics in Organic Neurology" This meeting will be held at the Lenape Hotel in Liberty, New York

The Sullivan County Medical Society will hold its semiannual meeting on May 14, at the home of Dr Harry Golembe, 111 Chaplin Avenue, Liberty Dr James E McCormack, assistant dean and instructor in medicine at New York University, College of Medicine, will speak on "Chemotherapy and the Antibiotics" the Antibiotics '

This series of postgraduate instruction will be given on Wednesday evenings at 8 00 o'clock

Warren County Dr Charles A R Connor, instructor in medicine, New York University, College of Medicine, will present a lecture to the Warren County Medical Society and the Glens Falls Academy of Medicine on April 24 at 8 30 Pm in the auditorium of the Crandall Library in Glens Falls His subject will be "Syphilitic and Arteriosclerotic Heart Disease "

Hospital News

[Continued from page 906]

Dr Jacob C Zillhardt, former head of the department of internal medicine, has been elected chief of staff of the Charles S Wilson Memorial Hospital at Johnson City *

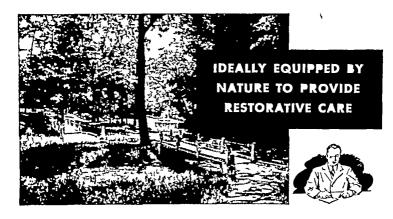

Dr Francis W Dodge has been elected chairman of the staff at Child's Hospital, Albany, to take the place of Dr Alva Travor who resigned recently after eighteen years in the post

Replacing Dr Charles K Winne, who served as secretary for twenty-nine years before his recent resignation, is Dr Edgar Kemp The two doctors

who have resigned their offices will remain on the hospital staff

Dr John G Hart was elected president of the Park Avenue Hospital, Rochester, medical staff to succeed Dr B F Kleker, retiring president, at the annual dinner and election of officers in February

Other officers elected were vice-president, Dr Claude M Francis, secretary, Dr Clarence A Shepard, chief of medicine, Dr John J Finigan, chief of surgery, Dr Guy B Van Alstyne, chief of obstetrics, Dr Arthur C Woggon, and chief of pathology, Dr C L Yuile *

Unsettled times like these bring the overburdened physician more than the normal number of patients suffering from chronic disorders of a cardiac, vascular or rheumatic nature

Here at the Spa, in superb plant facilities placed in a restful setting of great natural beauty your patient will find the restorative care he needs to prepare him for the full benefit of your continued medical direction

Under regimens of treatment which

you yourself recommend, your patient, relaxed in mind and body draws a full measure of improved health from the Spas naturally carbonated mineral waters

Well trained physicians are avail able in Saratoga Springs for consultation with your patient on the details of the program

Secure in the knowledge that your instructions for his care will be faithfully carried out, you find needed relief from your overbur dened practice

"PHYSICIAN GIVE HEED

TO THINE OWN HEALTH"

Many physicians have recently come to the Spa for the same kind of treat ments that helped their patients here. After a restorative "cure" at the Spa, you, too would return to your practice refreshed—revitalized—ready for the busy days that still lie shead

NECROLOGY

Charles David Bles, M D, 68, of the Bronx, died on March 5 He received his medical degree in 1911 from Fordham University Medical School Dr Bles served as medical officer with the 102nd Engineers of the New York National Guard from 1915 until he retired with the rank of lieutenant colonel in 1939 He was on active service on the Mexican Border in 1916, and in Europe in 1918

Raymond Elliott, M.D., of Rochester, died on March 5 at the age of 56 Dr Elliott was a member of the American Academy of Ophthalmology and Otolaryngology, the State and County medical societies, and the American Medical Association He was senior otolaryngologist on the staff of St Mary's Hospital in Rochester He was graduated

from McGill University in 1915

William J. Flint, M. D., 78, of Watertown, died on March 1 He had been a practicing physician for fifty-seven years, having received his medical degree in 1890 from the New York Homeopathic Medical

Dr Flint served on the staffs of the House of the Good Samaritan and Mercy Hospital in Watertown He was a member of the American Medical Association, and the State and County medical societies

Morris Friedson, M D, 66, died on March 18 He received his medical degree in 1910 from the College of Physicians and Surgeons, Columbia Univer-

Dr Friedson was a member of the American Medical Association, the State and County medical societies, and the Academy of Medicine director of pediatrics at Gouverneur Hospital, New York City, and served on the pediatric staff at Beth David Hospital, New York City Dr Friedson was a resident of New York City

Eugene Andrew Hammond, M D, 60, of New Berlin, died on February 12 Dr Hammond was a Chenango County coroner, and health officer for New Berlin and Pittsford He was on the visiting staff of Faxton and St Elizabeth hospitals, Utica, and Chenango County Memorial Hospital, Nor-wich He was graduated from Syracuse University,

College of Medicine, in 1912 He was a member of the American Medical Association, Utica Academy of Medicine, and the State

and County medical societies

James E King, M D, 71, of Buffalo, died on
March 9 He was emeritus professor of gynecology

at the University of Buffalo, School of Medicine, and former president of the International College of Surgeons

In 1946 Dr King was a delegate to the convention of the International College of Surgeons in Lima, Peru, having been its vice-president in 1920, and

president in 1938 and 1939

He was a member of the American Medical Association, the State and County medical societies, American College of Surgeons, Academy of Medicine, American Association of Obstetricians, Gynecologists, and Abdominal Surgeons, American Gynecological Society, and consulting gynecologist at the State Institute for the Study of Malignant Diseases, Lafayette General Hospital, in Buffalo, and chief consulting gynecologist to Meyer Memorial Hospi-

tal. Buffalo

Henry H Lyle, M D, of New York City, died on March 11 at the age of 72 Dr Lyle was professor of clinical surgery in the Cornell University Medical College He received his medical degree in 1900 from the College of Physicians and Surgeons, Columbia University, and was professor of clinical surgery there from 1913 to 1919, and assistant professor of surgery at the Cornell Medical College from 1919 to 1931 He also had been an attending surgeon at St Luke's Hospital, director of the cancer service at the New York Skin and Cancer Hospital, attending surgical specialist to United States Veterans Burcau, District No 2, and consulting surgeon to the Elizabeth A Horton Memorial Hospital at Middleton the State Reconstruction Home at Cornwall, and St_Luke's Hospital, Newburgh

Dr Lyle was a member of the American College of Surgeons, American Surgical Association, American Medical Association, Academy of Medicine, Society of Chinical Surgeons, and the State and County

medical societies

Alfonzo T Powell, M D, 85, of Coeymans, died on March 8 He was graduated from the Albany He was graduated from the Albany Medical College in 1889 Dr Powell practiced

medicine in Coe mans from 1890 to 1920

George H Schenck, M.D., 67, of Southampton, died on March 5 In 1904 he was graduated from the College of Physicians and Surgeons, Columbia Dr Schenck was a member of the American Medical Association, and the State and County medical societies, and had been a general practitioner in Southampton, Long Island, for more than forty years

NTA TO MEET IN SAN FRANCISCO

The Forty-third Annual Meeting of the National Tuberculosis Association will be held in San Francisco, June 17 to 20, 1947, according to the January issue of the NTA Bulletin Program arrangements are in the hands of the following committees

Medical Section-Dr John H Skavlem, chairman, Dr Emil Bogen, Dr Donald S King, Dr Herbert C Maier, Dr Eugene P Pendergrass, Dr Sidney J Shipman, and Dr Max Pinner, ex officio

Public Health Section—Glenn V Armstrong, chairman, Alfred E Kessler, Donald E Pratt, and Miss Beryl Roberts

A preliminary program of the meeting will appear in the April Bulletin

DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL, DIRECTOR

Genesee Valley Medical Care, Inc , Rochester, New York

GENESEE Valley Medical Care, Inc., located in Rochester, New York, was organized in November, 1945, by the Monroe County Medical Society and the Medical Societies of Livingston, Ontario, Wayne, and Yates counties, with the cooperation of representatives from the Industrial Management Council and other public-spirited citizens

A temporary license was issued by the New York State Department of Insurance on April, 1946, and the Plan began enrollment of membership on July 1,

Officers and Directors

The officers of the Plan are Dr James K

Quigley, president, the Honorable John VanVoorhis, vice-president, Dr Maurice A Bernard, secretary, and William C Gosnell, treasurer

Besides these officers, the Board of Directors is composed of Drs Henry B Crawford, James L Davis, Robert E Doran, James M Flynn, James S Houck, Albert D Kaiser, J Craig Potter, William A Sawyer, Robert F Schanz, W J Merle Scott, Leo F Simpson, and the following laymen serving on the Board of Directors Charles T Crouch, Marion B Folsom, Herbert C Holt, Julius Loos, Raymond B Welch, and Charles S Wilcox

Sherman D Meech, managing director of the Rochester Hospital Service Plan, serves as technical

advisor to the Plan

Financial Position

In order to get the Plan started, 105 physicians contributed \$100 each to establish a fund of \$10,500 to finance the Plan while it was being started By December 31, 1946, sufficient income had been received to offset this advance of the physicians

The contract allows a maximum benefit of \$150 for each subscriber where two or more surgical procedures are performed in any three months' In the event that more than one surgical operation is performed at the same time, payment is made only for the operation for which the largest amount is allowed in the fee schedule lowed for diagnostic x-ray service when followed by surgical procedures, and \$10 is allowed for anesthesia in any one case when administered by a physician other than the operating surgeon There are waiting periods of one year for menopausal conditions, hernia, hemorrhoid, tonsil, and adenoid operations A ten months' waiting period is required for maternity care, which is available only to the holder of a family contract. When 75% or more of all employees in a firm are enrolled, providing there is a minimum of fifty subscribers, all pre-existing condi-

tions, waiting periods, for maternity, etc., are waived both for the employee and his dependent. There is no age limit for membership in the Genesce Valley Medical Care Plan, masmuch as this is contingent upon membership in the Rochester Hospital Service Dependent children are covered on the contract until the anniversary date of the contract after the child has reached his eighteenth birthday Arrangements are made with an employee who leaves a group either to transfer his surgical and obstetrical coverage to his new place of employment or pay his premium direct to the Plan's office at the group rates until the anniversary date of his contract Thereafter, the contract would be at group conversion rates which are slightly higher

Enrollment

Genesee Valley Medical Care Plan is offered only to subscribers of the Rochester Hospital Service Plan members who are enrolled in payroll deduction As yet, membership is not available to collection groups or to individuals As of January 31, 1947, membership in the Plan totaled 13,585 However, it is expected that the membership will approximate 50,000 persons by the end of the first complete year of operation

Territory Covered

The operating territory of the Plan includes five counties Monroe, Ontario, Wayne, Livingston, and Yates counties Seneca County is also in the territory covered by the Plan, but the Medical Society of this county has membership under consideration. sideration No attempts at enrollment in this county have been made until the Plan has been accepted and approved by the Medical Society

Participating Physicians

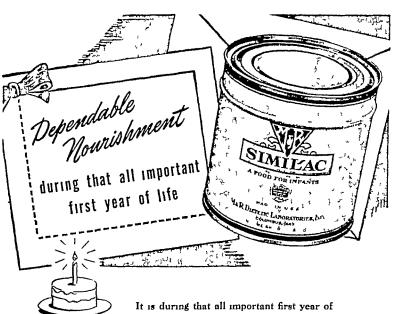

Practically all physicians living in the area covered are "participating" and at the present time over 86 per cent of the doctors, or 615 doctors, are members of the Plan There is no charge for a participating physician Full subscriber benefit fees are paid to any participating physician All elected officers and directors serve without remuneration, and it is a nonprofit plan

It is the practice of physicians to mail their patients' bills to the Plan's office, where the amount of credit is stamped The bill is then forwarded to the patient, showing the balance, if any, that is due, which is paid direct to the physician In all cases which is paid direct to the physician the physician sets his own fee against which the Plan pays specified amounts as listed in the schedule of benefits, which is a part of each member's con-

New Industrial Accident Fee Schedule

THROUGH the prolonged and painstaking efforts of a special committee of the California Medical Association, the Industrial Accident Commission has recently adopted a new and complete fee schedule. It became effective November 1, and copies have been sent to all members of CMA. The schedule provides an increase of approximately 25 per cent over the old schedule (or of approximately 9 per cent over the existing temporary one, which consists of the old schedule plus a 15 per cent surcharge)

It is anticipated that some insurance companies may attempt to circumvent the new schedule by making private contracts with individual physicians. Your Association believes that the new schedule, especially in view of current inflation, is reasonable, and will permit all properly conducted insurance companies to continue to make a fair profit on their projects. Therefore, your Association urges each

member to "stand by his guns" and adhere to the schedule as printed In this manner, fair medical fees will be obtainable for competent work, and the tendency to maintain a high quality of work will be encouraged

Some county societies may well decide to request members who arrange private contracts for industrial work to submit copies of those contracts to their Committees on Professional Conduct for review This is a matter for decision by each individual county unit

The new schedule, like all fee schedules, is not believed to be a perfect document, it is and should be subject to periodic review and constructive re-

adjustment
Your suggestions to the Fee Schedule
Committee of your county or state association will
be respectfully received in this connection—Cali
forma Medicine, Vol. 65, No. 5, November, 1946

The Private Office as a Health Center

If the general practitioner is unwilling or unable to do a health maintenance examination, the patient will perforce go to a clinic which has announced such a service. There has been much publicity lately on the importance of general physical examinations in the detection of cancer and in the maintenance of health. When a New York tabloid featured the opening of the Strang Clinic in New York, a flood of letters and calls poured in, and already that clinic is now booked until November, 1947.

Many of these applicants were willing and vable to pay their private doctors for this kind of service. How many of their doctors were willing and able to render this service? The cry that the operation of such a clinic (whether designated a cancer prevention or a health maintenance agency) is a blow to individualized medicine, is constantly heard. It is fair to ask the complaining doctors if they are prepared to give their patients an equivalent service.

We frown on hospitals, agencies, and clinics which do general physical examinations at cut rates because we see such activities as steps away from free choice, as examples of the corporate practice of medicine, and as devices to cheapen the value of examinations. Our frowns will retain no patients, however, our willingness to provide thorough diagnostic facilities in the office will

At the moment, the best approach to health maintenance examinations is by way of "cancer preven-

tion" This is a dramatic, attention-arresting, and important basis on which to offer such a service. It goes without saying that the practitioner will really do a thorough study, including vaginal and rectal examinations and a flat chest plate.

Patients have learned that a good physical examination including the history (and the drawing of specimens for blood count, urine analysis, blood serology) will take at least forty-five minutes. They will not be satisfied with anything more cursory. The doctor who is not prepared to devote the time and attention which this requires should send the patient to a colleague who is. If he fails to do either, let him not be surprised if the patient goes to a publicized health maintenance or cancer prevention chinic and gets a work-up at a reduced fee

Follow-up is important, and doctors need no longer be deterred by fear that the patient will think he is trying to make an unnecessary fee. If, for example, a small mass is found, and biopsy does not seem indicated, a follow-up visit a few weeks later to see if the mass has grown, is sensible, and the

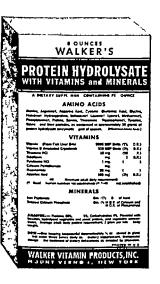

patient knows it is

The demand for group medicine, for more clinics, for new health centers and the like is growing rapidly A stand at this point, by offering complete diagnostic service, is the family doctor's chance to retain medical practice in its individualistic framework. It is, perhaps, his last chance —From the Journal of the Medical Society of New Jersey, Feb., 1947, page 89

X-RAY TECHNICIANS TO HOLD MEETING

The National Society of X-ray Technicians are holding their annual convention in Buffalo, New York, on June 1 to 6, 1947, at the Statler Hotel

NO TASTE BARRIER — For effective hyperalimentation, it is important to specify a protein hydrolysate product that does not present a taste barrier. The palatability of Walker's PROTEIN HYDROLYSATE with VITAMINS and MINERALS assures the physician of success in securing the patient's cooperation.

INDICATIONS: Pre- and postoperative dietary therapy, peptic vicer and certain other gastrointestinal diseases, nutritional edema and anemia, pregnancy and lactation, febrile disease, periods of active growth and senescence, and wherever protein hydrolysate-vitamin supple mentation is indicated

Available through all prescription phar macies. Professional literature on request.

Giant Cell Tumor of the Cervical Spine

To the Editor

I should like to comment on the article "Giant Cell Tumor of the Cervical Spine" by Dr Halford Hallock, in your Journal dated February 1, 1947

The patient described in that article was a patient in Morrisania City Hospital in the Bronx, New York, between September 28 and October 10, 1944 I had the opportunity of seeing the case in consultation in our Tumor Clinic. At that time, radiographs showed a complete dissolution of the bodies of the first four cervical vertebrae and a soft, part mass was visible in the prevertebral region. I think it a little less than scientific to present this

I think it a little less than scientific to present this case with a histologic diagnosis when no tissue was examined by a pathologist. When I saw the patient, he refused to allow a biopsy because a physician who had treated him previously had warned

him against the dangers of such a procedure. No mention of tissue examination is made in Dr Hallock's article

By Dr Hallock's own statement, he had found no record in the literature of any giant cell tumor that involved more than one vertebra. It is indeed "unique", therefore, to make such a diagnosis on an osteolytic lesion extending across several vertebrae. The case is extremely interesting, but until the histopathology can be demonstrated, it should not be recorded in the literature with a diagnosis implying known pathology.

(Signed) PAUL W COHEN, M D

February 14, 1947

Reply by Dr Hallock

To the Editor

I have no comment to make on Dr Cohen's letter If there was no histologic examination, the diagnosis could only be a clinical one and I think

this is obvious on careful reading of the article.
(Signed) HALFORD HALLOCK, M D

LAWMAKER'S DOCTOR

Everyone will agree that in the past few years the trend has been to socialize the activities of all people in the United States so that from "cradle to the grave" control of the individual will be the ultimate goal of government. The recent elections indicate that the people, as a whole, have lost interest in such legislation and are content to follow a path of free enterprise.

This new trend will last only as long as easy money, i.e., high wages and good crops, are in existence. At the first indication of a depression, or the more subtle recession, people will flock back to the standard bearers of the "Uncle Sam will take care of you" group

Unfortunately, people in need of coal, food, medical care, and so on, are more concerned, too often, with the procurement of necessities that they forget, in the long run, they have to pay for themselves. It is felt, then, that if the mood of the public changes as economic circumstances alter themselves.

the physician must keep up a solid interest in the activities of the law makers who represent his community, both nationally and locally

Every lawmaker in this country, with very few exceptions, has a doctor on whom he may call in case of emergency or for routine care. You may be that doctor and if you are, you have the best opportunity possible to give counsel where it will do the most good. Make use of your position as a friend, advisor, and constituent to give him hard and cold facts about the results of government control of medicine.

Any lawmaker who has the best interests of the people at heart, will agree that government would only be an expensive way to buy inferior medical care, if you will but tell him. A firm conviction in your mind is useless unless you can plant it where it will do some good —Your Medical Association, Bulletin of the South Dakota State Medical Associa-

tion, January, 1947

THE RIGHT ANSWER!

A mayor of a Midwestern town recently was visited by a delegation with the request that he reopen a red-light district closed during the war

Without the Danger

' of Systemic Alkalinization

It is generally conceded that prolonged and continuous administration of alkalis for chemical neutralization of gastric hydrochloric acid inaugurates detrimental sequelae

Yet, hyperchlorhydria in peptic ulcer and chronic gastritis requires positive correction, both for the comfort of the patient and healing of the underlying lesion.

Kamadrox produces the required relief without the undesirable sequelae. Acid neutralization is accomplished, in part, by the physical property of adsorption the chemical action is of a nature which does not cause acid rebound an excess of Kamadrox cannot result in alkalois.

Kamadrox consists of magnesium trisilicate—an insoluble and neutral powder—which produces continuous and prolonged acid neutralization without alkalinization; aluminum hydroxide—insoluble, neutral and astringent—which neutralizes acid by adsorption of the hydrogen ions, uncomplicated by a secondary acid rise; and colloidal kaolin—an inert silicate—which costs the mucosa with a protective layer and adsorbs bacteria and toxins.

A rational compound, constructed on sound therapeutic principles, Kamadrox is a remedy of choice in the management of peptic ulcer gastric hyperacidity chronic gastritis and gastroenteritis.

Cuts short the period of the Illness and refleves the discreting spersodic corph. Also valuable is Bronchills and Brenchild Arthus. In low-counce original bottles. A testpoorful every 3 to 4 has (Contain one-half grain Gold Tribronide in one fuldounce. Alcohol 234% by volume.) GOLD PHARMACAL CO., NEW YORK CITY

[Continued from page 920]

not show vigorous, imaginative leadership" to correct this fault. "Rather, it tended to hold back until public pressure was such that it had to go along"

That "there are more applicants for admission to medical schools than there are places in the first year class" is common knowledge But that "all those rejected are mediocre to poor aspirants" definitely is contrary to common knowledge

One agrees wholeheartedly with the concluding ntence "Medicine is coming of age as a social

science in the service of society "

To the teacher and administrator, this little volume is highly provocative, to the practitioner, it is stimulating, informative, and interesting

S R. BLATTEIS

The Modern Treatment of Diabetes Mellitus, Including Practical Procedures and Precautionary Measures By William S Collens, M.D., and Louis C Boas, M.D. Octavo of 514 pages, illus-trated Springfield, Illinois, Charles C Thomas, Cloth, \$8 50 1946

The Modern Treatment of Diabetes Mellitus, Including Practical Procedures and Precautionary Measures, by William S Collens and Louis C Boas, is a unique, practical, thorough, and complete "di-abetologic" therapeusis

Doctors Collens and Boas divide the diabetic into three classes the mild, the moderate, and the st requires no insulin. They subsevere, the first requires no insulin divide the severe type into those patients without ketosis, with ketonuria, with compensated acidosis, and those with uncompensated acidosis, precomatose, or in coma. Each type is carefully and individually dealt with in terms of recognition and

The authors show how to make use of ingenious enty-four-hour time clocks. These clarify the twenty-four-hour time clocks method of distributing the meals to conform to the time of the anticipated insulin effect. Some clocks differ with the various times for administering insulin. Others vary with type or combinations of

types of insulin

Having arrived at the dietetic formula with carbohydrate, protein, and fat in grams, one needs but to use the Diet Calculator incorporated in the front cover of the book, to determine the menu

The pharmacology and the pharmacodynamics of insulin are elucidated in answering the following

questions

What is the difference in action between 10 1 units and 30 units of insulin when given to the same

patient under the same conditions?

What is the difference in the blood sugar lowering effect of the same dose of insulin when given to different diabetics of varying degrees of severity with fasting blood sugars ranging from 150 to 400 mg per cent?

The most important reference books and current texts on the subject do not provide the answers

This one does

An excellent table, well illustrated and explained, for estimating insulin requirements, based upon the severity of the diabetic, is the answer to "What shall the *initial* dose of insulin be?"

The book is replete with diets, charts, photographs and kodachromes. It is free of theory and most practical for the diagnosis and therapy of diabetes

mellitus and its complications

The Diagnosis and Treatment of Pulmonary Tuberculosis By Moses J Stone, M D, and Paul Dufault, M D Large Duodecimo of 325 pages, Dufault, M D Large Duodecimo of 325 pages, illustrated Philadelphia, Lea & Febiger, 1946 Cloth, \$3 50

In reviewing this excellent little book one cannot help but be impressed with the multitude of similar books that have been written on identically the same subject One wonders, therefore, at the need of so much duplication, reiteration, and, shall we say, overproduction And yet, this particular book justifies its publication Seldom have we found in so small a volume so much information so concisely and so lucidly presented We heartily recommend it to all students and practitioners of medicine

FOSTER MURRAY

Electrocardiography In Practice By Captain Ashton Graybiel (MC), USNR, and Paul D White, By Captain M D, with the assistance of Louise Wheeler, A M, and Conger Williams, M D Second edition Oblong duodecimo of 458 pages, illustrated Philadelphia, W B Saunders Co, 1946 Cloth, 8700

The second edition of Graybiel and White's Electrocardiography in Practice retains all of the excellence of the first edition. Much new material has been added. There are adequate explanations of unipolar and esophageal leads and of the effects of exercise and low oxygen inhalation tests are four new tables which will make much cardiologic information readily available to the practitioner We still consider the format of the book awkward but the fact that it is retained in the second edition shows that it has doubtless served its purposes

All in all, this is an excellent guide to electrocardiographic interpretation and can be highly recom-

mended

MILTON PLOTZ

A B C of Medical Treatment. By E Chamberlain, M D Duodecimo of 208 Noble pages New York, Oxford University Press, 1946

This little British book on therapy is an excellent example of what the average medical book ought to be—concise, informative, and authoritative Drugs and procedures recommended have the earmark of being given as a result of personal use or thorough study by an excellent teacher

MEYER A. RABINOWITZ

Skin Diseases, Nutrition and Metabolism By Erich Urbach, M D with the collaboration of Ed-ward B LeWinn, M D Octavo of 634 pages, illustrated New York, Grune & Stratton, 1946 Cloth, \$10

The book is an attempt by its author, Erich Urbach, in collaboration with Edward B LeWinn, to demonstrate the association of dermatology with the nutritional, biochemic, and metabolic aspects of internal medicine. With the exception of the dermatoses known to be of dietetic origin, such as those caused by food allergy, vitamin deficiencies, etc, the author has not been able to support his contention. He admits that this relationship is far from proved He states, repeatedly, that all the evidence advanced on the value of diet in many dermatoses, is purely assumed or clinical, and not He explains the apparently good results specific on the theory that therapeutic diets affect the chem-

istry of the body and skin and, in this way, change the metabolism of the skin, thus stimulating the underlying cutaneous pathologic process. He compares the results obtained with those induced by nonspecific therapy, such as foreign protein injections or fever therapy. "There is no specific form of dietary for most dermatoses", the author states (page 347), "in other words, there is no special diet for dermatitis, psoriasis, acne, or other cutaneous disorders." In spite of this, the writer repeatedly recommends specific diets as therapy in all the dermatoses mentioned.

The book contains a number of illustrations, all in black and white. There are some on urticaria vulgaris and papular urticaria, but labeled according to cause, as, hypersensitiveness to mutton, to beef, to strawberries, etc. Illustrations of similar dermatoses would be of value only when the rashes demonstrate certain particular characteristics associated with the various etiologies or with other factors. These illustrations, however, are those of

simple urticaria

The chapter on "Metabolism and Biochemistry of the Skin" and that on "The Influence of Diet on the Metabolism of the Skin" are the most interesting in the book

This volume covers over 630 pages and has a bib-

hography of more than 1,300 references

ABRAHAM WALZER

Urologic Roentgenology By Miley B Wesson, M D Second edition Octavo of 259 pages, illustrated Philadelphia, Lea & Febiger, 1946 Cloth, \$5 50

This well-printed, splendidly illustrated volume of 250 pages is well worth the study of any one interested in making diagnoses of kidney pathology

Dr Wesson's long experience and accomplishments, together with his gift for writing in clear English, make the book a delight to read. There are many practical suggestions on the care of instruments the technic of the urologist's part in the making of roentgenograms and a wealth of suggestions as to their interpretations. As a textbook for advanced students, as a constant companion for urologic residents, and as a useful work for a quick review of the subject, this book is highly recommended.

J STURDIVANT READ

Office Treatment of the Nose, Throat and Ear By Abraham R Hollender, M D Second edition Octavo of 552 pages, illustrated Chicago, Year Book Publishers, 1946 Cloth, 86 00

The author presents and condenses into a comparatively small volume a lifetime experience together with the experiences of others The author describes in detail the practical aspects and methods of office procedures The facts are carefully correlated and evaluated Where there are several methods of treatment, the author evaluates them as he does each subject at the conclusion of the chapter The subject matter is very well arranged, and in cludes a great many illustrations. At the end of each chapter the reader will find authoritative ref-The author presents his subject in such a manner as to stimulate the reader in considering the ear, nose, and throat, not as an entity, but as a component part of the entire body economy A careful review of this book is really a postgraduate course The reviewer read this book most carefully from cover to cover and sincerely recommends this volume to all otolaryngologists and especially to the younger men and residents

Announcements

[Continued from page 918]

Gentlemen

This is to notify you that the Board of Regents at a meeting held December 20, 1946,

VOTED, That the determination of the medical Committee on Grievances in the matter of the application for the revocation of the physiotherapy license heretofore issued to Vincenzo A Greco, also known as Vincent A Greco, New York, be accepted and sustained, and that, in compliance with the recommendation of said committee, physiotherapy license No 140, issued under date of November 17, 1927, to said Vincenzo A Greco, permitting him to practice physiotherapy in the State of New York, and his registration or registrations as a physiotherapist, wherever they may appear, be suspended for a period of one year from the date of service of the order effecting such suspension, and that the Commissioner of Education be empowered and directed to execute, for and on behalf of the Board of Regents, all orders necessary to accept the determination of said Committee on Grievances and to carry out the terms of this vote

Mr Greco was registered for the year 1947 to 1948 from 178 East 104th Street, New York City The order of suspension was served on Mr Greco, January 6, 1947, and his suspension is therefore effective from January 6, 1947, to January 6, 1948

Gentlemen

This is to notify you that the Board of Regents at a meeting held December 20, 1946,

VOTED, That, pursuant to the provisions of subdivision 1 of section 1264 of the Education Law, medical license No 27596, issued under date of February 7, 1933, to Robert E Hodgson, under the name of Robert Edmund Hodgson, through indorsement of his Georgia medical license under the provisions of section 51 of the Education Law, constituting his authority to practice medicine in the State of New York, be revoked, annulled, and canceled, and that his registration or registrations as a physician, wherever they may appear, be ordered annulled and canceled of record, and that the Commissioner of Education be empowered and directed to execute, for and on behalf of the Board of Regents, all orders necessary to carry out the terms of this vote

Dr Hodgson was registered for the year 1947 to 1948 from 2400 Seventh Avenue, New York, New York The order of revocation was served on Dr Hodgson on January 6, 1947

Yours truly,

(Signed) Jacob L Lochner, Jr M D, (Secretary)

WAS ROME BVILT IN A DAY?

The answer to this time-worn question, as everyone knows, is NO. The same holds true if the question concerns recovery from hemorrhoidal disorders. The acute symptoms may be quickly relieved but regression of the local pathology is a longer process. To foster complete recovery in hemorrhoidal disorders, local treatment should be con tinued for three to four weeks after the acute symptoms have been relieved.

The patient's cooperation throughout treatment is easily obtained with—

**Anusol Hemorrhoudel Suppositories are safely used for prolonged treasment because they contain no narcosic no aneathetic no analgene no hemostatic. Anusol does not mark serious pathology There are no systemic by-effects. *Rr. U. S. Pet. Of

Planned Protection

Protection against the inroads of dental caries may be planned with 'Enziflur' (calcium fluoride with vitations C and D) Accumulating evidence indicates that the incidence of tooth decay may be materially reduced by the administration of "Enziflur"

"Enziflur" Lozenges should be allowed to dissolve slowly in the mouth, thus bringing the surfaces of the teeth in contact with the fluorine-bearing saliva One 'Enziflur" Lozenge daily supplies the optimal dosage of calcium fluoride in combination with minimum daily requirements of vitamins C and D

Descriptive literature providing indications dosages and contraindications available to physicians and dentists upon request

"Enziflur" Lozenges (No 805) are available in bottles of 30 and 100

"ENZIFLUR" Lozenges

The etiology of many cases of vaginitis and cervicitis is based on a recondary bacterial invasion

Against such infections Triple Sulfa Cream brings to bear three sulfonamides—exerting optimal bacte riostatic and bactericidal action at different specific obl fertis.

Triple Sulla Cream has proven clinically effective in post-operative vaginitis or cervicitis, successive vaginitis for cervicitis, successive vaginitis futorpirillosis (Vincent s infection of the vagina) * and related synecological conditions. Eradication of the infection, bealing of the mucosa and

return to normal pH levels have been observed within twelve to twenty-one days after institution of this simple convenient therapy

Triple Sulfa Cream represents an optimal association of sulfathiaxole. N acetylsulfantlamide N benzoylsulfanilamide and urea peroxide, incorporated into a pleasant water soluble.

absorptive cream base. Available at all leading prescription pharmacles.

IN CONSTIPATION OF PREGNANCY...

"SMOOTHAGE" MANAGEMENT

Pressure on the pelvic bowel by the enlarged uterus and impaired abdominal muscle tone account, to a great extent, for the high incidence of constipation in pregnancy

Smooth gentle normal evacuation—the desired action in pregnancy constipation management—is afforded by the smoothage of Metamucil.

By providing soft, plastic, water retaining bulk Metamucil
promotes normal, easy peristaltic movement.

Metamucil is the highly refined mucilicid of Plantago ovata (50%) a seed of the psyllium group combined with dextrose (50%) as a dispersing agent.

OR SEVERAL YEARS past and in the course of extensive development research interchemical Corporation has been deeply concerned with protein chemistry

The Blochemical Division was formed to pursue the study of proteins and amino acids in modern laboratories fully equipped for the purpose This Division—one of the fourteen which bear the I C. trademark—is fully cognizant of the problems concerning protein nutrition.

Substantial amounts of crystalline amino acids are being manufactured and offered for clinical research and trial. For intravenous administration, AMINO ACIDS—LC. Lyophilized—rich messential amino acids—represents a major advance in parenteral alimentation

The facilities and cooperation of this organization are cordially extended to the medical profession in the aim to evolve a clearer understanding of the role of amino acids in medicine and to expose new horizons in nutrition

chronic organic disease Many patients with chronic organic disease—
arthritis or asthma, for example—sink into a persistent depression
characterized by discouragement, or even despair Unless effectively
combated, this depression may handicap management of the basic
disorder and intensify its symptoms

By restoring optimism and interest in useful living, Benzedrine Sulfate frequently helps to overcome prolonged depression accompanying chronic illness Obviously, in such cases, careful observation of the patient is desirable, and the physician will distinguish between the casual case of low spirits and a true mental depression

benzedrine sulfate (racemic amphetamine sulfate S.K.F.) Tablets and Elixir

WHAT
THESE
SYMBOLS
STAND
FOR ?

REXALL FOR RELIABILITY

From man's earliest ages, the serpent is found in religious, medical and art symbolism. It enjoys many and varied connotations, some good, some evil. This particular serpent, with its tail in its mouth, symbolizes Eternity—time without beginning and without end.

The modern symbol of superior pharmacal service is the familiar Rexall sign. More than 10,000 independent, reliable drug stores throughout the country display this symbol. It means that prescriptions filled there will be compounded with the highest pharmacal skill, from pure, potent drugs. All Rexall drugs are laboratory-tested under the Rexall control system.

5 mg

Hydrated Silicic Acid

225 mg.

A descriptive folder will be furnished upon request.

Serious disturbances may result from moderate doses of thyroid unless an adequate intake of the B Vitamins is assured (1, 2, 3, 4, 5) A relative hypovitaminosis is produced, with loss of appetite and the occurrence of katabolic destructive changes in the animal organism

PANTABEEROID Tablets contain thyroid with liberal amounts of all the B vilamins, so that the supply of the latter is rendered adequate even with minimal thyroid dosage

IT IS TO BE BORNE IN MIND THAT THE PRESENCE OF THE B VITAMINS DOES NOT ELIMINATE THE NECESSITY FOR CARE-FUL ADJUSTMENT OF THYROID DOSAGE

When Nitrogen Balance Must Be Restored

In the correction of protein insufficiency, or in the maintenance of nitrogen balance, accumulating evidence substantiates the dictum that hydrolyzed protein substances should be employed *only* when oral feeding of protein foods is impossible or not feasible

It has been shown experimentally when hydrolysates of protein are injected at two different rates (10 and 15 mg of nitrogen per Kg of body weight per minute), the more rapid injection rate results in a higher excretion of both free amino acids and peptides. The authors ventured that even in the presence of a definite demand for protein replenishment, nitrogen excretion is mainly controlled by the kidney threshold

In a recent survey, Ravdin² stated that "When oral feeding is used, whole foodstuffs should be given. There is no beneficence in feeding protein hydrolysates unless there is evidence of faulty digestion. Feeding of mixtures of polypeptides and amino acids may result in an absorption rate of amino acids which is more rapid than can be resynthesized by the liver, especially when the function of this organ is not normal."

When protein foods are ingested, the contained amino acids are released slowly and in a sustained manner during the course of the digestive processes. The absorptive capacity of the intestinal mucosa is not overtaxed, and maximal amino acid utilization is made possible without urinary loss.

As a source of protein, meat ranks high among the foods of man It is 96 to 98 per cent digestible, and its protein is biologically adequate, capable of satisfying every protein need of the organism

ELECTROCARDIOGRAPH

depend on a manufacturer with long experience in producing

Accurate STANDARD Permanent RECORDINGS!

Cardiotron The First Successful

Direct-Writing ELECTROCARDIOGRAPH

The unexcelled performance of the direct recording Cardiotron—a product of the Electro Physical Laboratories—reflects more than a decade of experience in manufacturing direct-recording electroencephalographs

In the Cardiotron the technique of direct electro recordings are developed to perfection. This instrument produces instantaneous, permanent readings. All photographic procedures are completely eliminated. Thus, the Cardiotron enables cardiographic investigation during surgery as well as in routine office or clinical practice or even in the patients home. The Cardiotron weighs only 31 pounds is vibration proof and is free of susceptibility to strong interfering electrical fields. You are invited to send for complete details.

With Argyrol you avoid the "vicious circle" of congestion followed by compensatory congestion. Moreover, the decongestant and bacteriostatic action of Argyrol contributes most to the aid of Nature's "first line of defense"—hence to speedier return to normal function

The Three-Fold Action of ARGYROL

- 1 ARGYROL is decongestive, without irritation to the mem brane, and without ciliary injury
- 2 ARGYROL is powerfully bacteriostatic, yet is non toxic to tissue
- 3 ARGYROL stimulates secretion and cleanses, thereby enhancing Nature's own first line of defense

Three-Fold Approach to Para-nasal Therapy

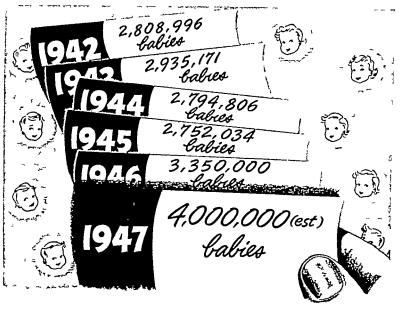

- 1 The nasal meatus by 20 per cent ARGYROL instillations through the nasolacrimal duct
- The nasal passages with 10 per cent ARGYROL solution in drops
- The nasal cavities with 10 per cent ARGYROL by nasal tamponage

ARGYROL the Physiologic
Anti-infective with broad, sustained action

Mode only A C. BARNES COMPANY • NEW BRUNSWICK, N J

Borden's prescription specialties are flexibly adaptable to cope affectively with the sharply increased number of your infant feeding problems.

BIOLAC—a complete infant formula (only vitamin C supplementation needed) for infants deprived of mother's milk.

DRYCO—a powdered high protein low fat, moderate carbohydrate milk food ideally suited for all formulas.

BETA LACTOSE—an exceptionally palatable highly soluble milk sugar for formula modification. MULL SOY-a hypo allergenic emulsified soy food for infants and adults allergic to milk proteins. The 11 standard dilution approximates cow's milk in fat, protein carbohydrate and mineral content.

KIIM a spray-dried whole milk with soft curd properties essential in infant feeding and special dieta. Particularly valuable when avail ability or safety of fresh milk is uncertain

Borden prescription products are available at all drug stores. Complete professional information may be obtained on request.

USEFUL PRODUCTS FOR BUSY PHYSICIANS

PENICILLIN VAGINAL SUPPOSITORIES Schenley

containing 100,000 units of penicillin each provide a new, convenient, painless method of applying the drug directly at the site of infection. In resistant cases 2 suppositories per application may be used. Supplied in boxes of 6 and 12.

PENICILLIN IN OIL AND WAX Schenley (Romansky Formula)

in B D* Disposable and Metal Cartridge Syringes. Cartridges contain 300,000 units of penicillin Also available in 10 cc vials each cc containing 300,000 units, suitable for use with the standard glass syringe. No refrigeration is required easier to use in and out of the office

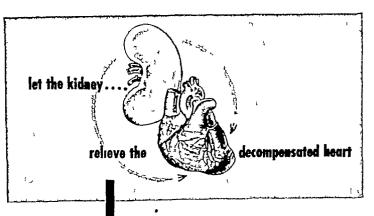

Penicitin Paragraphs, providing a continuing summary of penicillin therapy in specific disease entities, will be sent to physicians requesting to be placed on our mailing list

The modern approach to the treatment of congestive heart failure takes into account the synergism between the action of theophylline and a well-tolerated mercural diuretic.

In modern practice the action of theophylline is secondary or adjunctive—it facilitates intramucular absorption of the mercurial and complements with increased glomerular filtration the sustained mercurial diuresis.

Mercuhydrin combines mercury and theophylline as the sodium salt of methoxyoximercuripropylsuccinylurea-theophylline.

of Mercuhydrin prevents the mounting fluid burden which continues to damage the heart if treatment is inadequate.

of Mercuhydrin obtains uniform "dry-weight" levels of body fluid —avoids intermittent exhausting bouts of edema.

as well as by vein Mercuhydrin is well tolerated and does not cause undue pain or serious tissue damage. Mercuhydrin by muscle avoids the sudden impact upon the heart of relatively massive drug concentrations.

Medical Standards

In the State of New York medical standards of education, licensure, and practice have been created largely by the efforts of doctors of medicine and cooperative legislators to keep inviolate the medical practice act

The net result which has accrued to the advantage of people of the state has been one standard of medical training and practice available to all, rich and poor alike the best. It is doubtful whether most people understand the significance of this fact. It is taken so much as a matter of course that it is quite impossible to conceive of any other state of affairs When anyone calls a doctor in New York City, Catskill Rome, Bath, Skaneateles, Plattsburg, or Dover Furnace he is sure of medical attention by one who has met the standard minimum requirements as to education, training, and licensure.

Even the doctors of medicine themselves who in the recent past have striven so hard to raise those standards to their present high excellence seem to assume that they will remain static at that peak, that little effort is necessary to keep them there Yet the yearly legislative attacks on the medical

practice act by cultists and their supporters should be sufficient warning that this is not so

Support of the cultists by their followers among the public seems to tloctors of medicine hard to understand in view of the unscientific, fraudulent, and commercial nature of their cults. Why should people who have good medical attention available everywhere support cultists? Why have your aching backs twisted, for example, when you can really find out what is the matter with you? Well, the public believes what it wants to believe, and does not have the benefit of a medical training Many are convinced that they have been helped by the particular cultists whom they patronize, and this patronage with its customer-satisfaction reacts necessarily upon the cultist himself, convincing him (if he had any prior doubts) that he has "got something" He does not hide this light under a bushel, and the satisfied customers peddle his praises Why should citizens who will patronize the black markets and lose no sleep over that fact care whether the cultust practices legally? Why expect the citizen-customer to question the scientific basis of the cultists'

belief? Does he concern himself about the scientific principles by which his automobile runs? Of course not He will light-heartedly smash himself up and others with him in any jalopy that will go from here to there in a hurry, science or no science

Surprisingly-or is it?-it is not the benighted, the ignorant, the dolts, oafs, wastrels, and uninstructed primates who patro-Stupidity is the common herinize cultists tage of the begats of Adam Our aging population is producing many chronically ill persons of all walks of life has so successfully and scientifically controlled infant mortality, epidemics, and the diseases common to the younger age groups, be it noted among other things, by insistence upon proper qualifications for doctors through the medical practice act, that it has created a growing horde of potential middleaged sucker-customers for the cultists

In such a lush vineyard those gentry would

be less than human and much poorer if they did not labor diligently They would like to have the status of legality, to be "doctors" of their particular rackets, but not through the hard way of medicine which is open to anyone who will exercise the brain over a long period of years. No, it is simpler and easier to attack the medical practice act or to have a basic science law enacted. If the cultists keep at it long enough and persuade enough still-living, paying customers to badger the legislature each year who knows? What can they lose?

Medical standards of education, licensure, and practice will remain high and inviolate only as long as the profession, with the help of those interested in maintaining and elevating the public and private health of the nation, will work unceasingly to keep them there Complacency, indifference, aloofness, disregard of the plain facts of life, and neglect may well result in disaster

From Bed to Job

On Saturday, February 22, we attended a meeting sponsored by the local Fracture Committee of the American College of Surgeons At it we heard addresses by Dr Howard A Rusk and Dr George Deaver To us it was an epochal occasion first time we heard enunciation of the doctrine that the doctor's responsibility to his patient does not end with the patient's discharge from the hospital It does not end until the patient, no matter how severe his injury, is restored to self-respecting life as a contributive member of the community Dr Robert H Kennedy testified, from his Army experience, that he had seen the doctrine and the system work The patient, not his disease, is treated

To many doctors such a statement will sound hopelessly utopian But the doctor is backed by a service of which, we are ashamed to say, we had never heard—The State-Federal Vocational Rehabilitation Services, established under Public Law 113 of the 78th Congress (Write to the Federal Security Agency, Office of Vocational Rehabilitation, Washington, D C, for the pam-

phlet, "Vocational Rehabilitation for Civilians")

From now on it will be recognized that there is practically no such thing as a hopeless cripple Paraplegics are taught to turn themselves over in bed, to walk with braces and crutches, to get up from and sit down in a wheel chair, and to go up and down stairs We saw one do it, and after he had been helpless in a hospital for five years

We heard of a blind man, also minus an arm, completing his course at Princeton His only annoyance was the unnecessary attentions of people trying to be helpful

We heard of hours, previously spent in objectiveless physiotherapy, now converted to exercise in a room in which the cripple finds every gadget he is likely to encounter in his normal daily activities. Door knobs, door latches, automobile doors, ice box fasteners, windows to open, lights to put on—every activity and skill to be learned for a useful purpose. William James must be cheering in his grave.

You think you've heard something? Wait Medical service, counsel and guid-

ance, training, job finding. Not only are they provided for under Public Law No 113, but they pay "Before rehabilitation these handicapped men and women received wages and subsistence of \$12,000,000 a year from friends, and public and voluntary agencies. After rehabilitation they became job holders earning at the rate of \$73,855,700 a year—an income increase of 600 per cent. The Federal Government collected, in the form of income taxes all but roughly \$1,900,000 of its total contributions."

When industry, already remarkably cooperative—one large optical firm employs only blind darkroom workers 300 of them embarks fully upon this program, compensation cases will go back to some form of activity at once, instead of sitting around losing skills and drawing compensation until such time as they can return to their original jobs

Think of the gain to the patient and the saving to the insurance com-

panies And the doctors concerned are

The motto of the workers in the vineyard—and it is certainly the Lord's—is not "How much [function] have you lost?" but "How much have you got left?"

In one way we are ashamed of our ignorance, but in another we are glad, because we know that we, and everyone else in that Washington's Birthday audience, felt that we were hearing of the launching of a work of profound moral and economic significance

For more years than we like to think of, this is the first movement that has come to our attention calculated to help the helpless, to restore their self-respect, to ease the Nation of a great burden, and to teach man to stand on his own feet rather than to lie back upon the State

"Mine eyes have seen the glory of the coming of the Lord"

¹ Vocational Rehabilitation for Civilians, Federal Security Agency pp. 19 and 20

The Trend to Collectivism

The New York Times has just completed a survey by its correspondents of the major countries of the world. The net result shows a trend toward nationalization growing outside of the Western Hemisphere.

The prospects for the survival of the competitive free enterprise system outside the Western Hemisphere seem covered with uncertainty in view of the growth of nationalisation under various forms of socialism and communism

Canada and the United States seem relatively unaffected as yet. But those who studied the sinuous economic and political convolutions of the Administration from 1933 on could see in this movement the germ of national socialism here. Its frequent slighting references to "economic royalists," signifying any one who had two depreciated coppers not obtained from the public payroll to click together its obvious and at times not too delicate wooing of the labor vote, its sponsorship of compulsory health insurance,

its NRA and A.A.A, its barely concealed contempt for constitutionality and precedent caused many to pause, think, and curse.

The war accelerated of necessity what had been previously a slow deterioration of constitutional government in favor of the appalling alphabetic agencies backed up by necessanglic politics. Moley, Hugh Johnson, Hopkins, Tugwell, McNutt, and Wallace faded into the shadowy limbo of newly forgotten history. They had all contributed largely to the political situation, had shaped much of its course, at times brilliantly, always expensively.

Where prehistoric animals trod, they left footprints which hardened into stone. More recent administration primates, drifting over the yet soft muck of modern American history, have left not footprints but laws, legislative imprints in the texture of the national life. These imprints bedded in the statutes will not soon be obliterated they will continue to influence the American way of life—for a time. How long and to what extent remains to be seen.

¹ March 3 1947 p. 1.

Recently, political reaction has visited Great Britain, saddling an essentially conservative people with austerities of national socialism in the wake of a devastating war. It is understandable as an experiment How long will it last? Newdealism as a political philosophy throve in our republic for twelve years in the wake of the first World War and its subsequent depressions. Now it, too, bereft of vitality and clothed in the faded, tattered, moth-eaten habiliments of a dubious former respectability, has been embalmed in the statutes—for a time

972

A resurgent republic, with all its vital turmoil of dissention, dissidence, eruptions of strikes, freedom of speech, and independent zest for action, seems to have emerged in this country from the shackles of national socialism masquerading behind the false-face of the administration. Not yet, it seems, must we in the Western Hemisphere resort to the lowest common denominator of economic and spiritual bankruptcy—collectivism, with its handmaiden

of slave labor necessary to force production to levels whereby living standards barely endurable can be maintained through the exercise of rigid austerity

Forced labor contingents comprise, in the main, three groups The first consists of war prisoners from the Axis nations and their satellites. The second is composed of civilian workers either deported from the occupied countries or retained from among the expelled nationalities in Eastern Europe after their families have been banished. The third consists of the political prisoners of the countries now under Communist domination.

We sincerely hope that our current leadership with the backing of the people will heed Dr Franklin's admonition, "You have a republic if you can keep it"

Doctors, as an influential portion of the citizenry, can exert themselves to see that we do keep it

The Millennium

"We are convinced that Health is not merely the absence of disease or infirmity, but a state of complete physical, mental, and social well-being, the enjoyment of which we declare to be a fundamental right of every human being without distinction of race, religion, political belief or economic or social condition

"We believe its attainment is essential for peace and security"

Where do you think that statement comes from? Jonathan Swift was a great satirist, but he never reached a peak such as that

We always thought we were something of an idealist ourself Certainly we believe in hitching our wagon to a star What is man's reach for if not to exceed his grasp? Hope springs eternal in the human breast

But sad experience has taught us We no longer aim at objects we know we can't hit We no longer desire the unattainable We know that hope deferred maketh the heart sick We know the essential wisdom of not biting off more than we can chew

And what kind of world would it be in which every human being were free from worry of every sort, in a state of complete physical, mental, and social well-being? Thomas Jefferson was something of an idealist himself, but he contented himself with saying that man was entitled to "the pursuit of happiness". And a stimulating, invigorating, heady lifelong pursuit it is. Usually unsuccessful, to be sure, but who cares?

The definition of health quoted at the head of this column comes from Dr Parran, President of the International Health Conference, in his closing address at New York, July 22, 1946

If any members can believe, or want to believe such nonsense they had better stop conferring about other peoples' health and concentrate on their own Perhaps they think that striving for such an ideal world would be in the nature of a Noble Experiment

Another one? Haven't we really had enough?

² New York Times, March 4, 1947 p 24

Dangers of Motorized Tools

Warning!

The increasing use of motor-driven tools for recreational or other purposes in home workshops will undoubtedly swell the number of home accidents of varying degrees of seventy in the near future

Ordinary shop practices are either unfamiliar to or neglected by the enthusiastic ama teur, who is inclined to rush in without proper precautions where previously singed, burned, or otherwise variously mutilated angels fear to tread

The number of home workrooms, cellar shops, craft cribs, or what-have-you, may be expected to increase rapidly with the return to production of small motor-driven equipment. In the eager hands of small boys—or those of older boys from 8 to 80—saws, hammers with frayed striking surfaces, high speed drills, grinders, unprotected belting, hot lead, or babbitt can be just as lethal as in commercial shops, and in our opinion vastly more so

Commercial shops are required to provide safeguards. It is profitable commercially to keep the accident rate down and, therefore, if for no other reason, an inducement to do so. Even so, industrial accidents increase at an appalling rate

What of accidents in these home shops?

Who knows how many there are? How many shops, how many home-shop accidents, for instance, in this State alone? These home workrooms are not listed anywhere to our knowledge, they are not specifically covered by insurance, or required to be, accidents there are not required to be reported Should they be?

Can or should something be done, if possible, to avoid preventable accidents in this new and rapidly growing field? If so, what?

Shop practice is taught in the schools, to be sure—Is it observed in the home? Someone¹ has remarked that daily Congress opens with a prayer and closes with a probe. It is one thing to have ideas, quite another to live up to them—It seems to us that a first step could be made by, let us say, the Farm and Home Bureau to ascertain the possible magnitude of the problem—We feel certain that the physicians of the country would cooperate in any such research—The Department of Commerce could doubtless provide information as to the volume of sales of such home-shop equipment. Also the insurance companies might be interested.

We solicit ideas and suggestions from all to whom this problem may prove of interest

1 Not Bill Nye.

An Anniversary

The Kings County Medical Society

On March 2, 1822, a group of physicians of the County of Kings met in the Village of Flatbush to organize what, in the course of a century and a quarter, has become one of the largest constituent groups of the State Medical Society

During this period of time the Society has grown and prospered, it has acquired its own handsome building and developed a noteworthy library in its associated Academy of Medicine, it has accomplished much on behalf of the people and the profession of Brooklyn

This One Hundred and Twenty fifth Anniversary was fittingly celebrated by a dinner at the Hotel St George, in Brooklyn, with a large attendance at which Dr Abraham Koplowitz acted as toastmaster, and among the speakers were Drs. Morris Fishbein, John J Masterson, and Earl H Mayne

The New York STATE JOURNAL OF MEDICINE desires to extend its felicitations to the Kings County Medical Society and its good wishes for the continued success of its many contributions to the cause of organized medicine in this State

Current Editorial Comment

Memorial Day Perhaps the best tribute to the American physicians who have lost their lives in the military services in all American wars and, therefore, will be especially remembered on this day, is the record low mortality among the wounded in World War II Official mortality figures for the Civil War among the Union forces was 14 per cent, for World War I, 8 3 per cent from battle wounds, for World War II, 4 4 per cent, the lowest in the history of any army in the world

That those physicians whom we particularly remember should not themselves have survived to share the glory of such accomplishment lays a heavy burden of obligation upon us to reduce mortality from battle

casualties to zero

True, all men are mortal, but that fact seems little enough reason to dedicate the years of our lives to the stupidity of war Is it necessary to be both mortal and stupid? Low battle casualty mortality rates mean merely skillful stupidity, better organized, better implemented, and more intelligent stupidity. For all war is stupid, the end of reason, and the recourse of fools

The American Hospital Under the above title the Committee on Medicine and the Changing Order, of the New York Academy of Medicine and the Commonwealth Fund, have made available another monograph in a commendable series of which this study of American hospital development by E H L Corwin, Ph D (1946) is the ninth

The book is authoritative, factual, and comprehensive, it covers the hospitals' domain, their financing, their distribution, and the utilization of their facilities, considers the hospital as an employer and as a training ground, the organization of their medical services, their construction and the characteristic features of present-day hospitals, among other things, together with much historic background material

The study is exceptionally timely "The ever-accelerating expansion of our hospital domain in the last fifty years, an expansion which has exceeded several-fold the increase

in population, was the result of the phenomenal development of medicine and surgery, the growth of wealth, the fast industrialization and urbanization, and their concomitants of bad housing and overcrowding

"Although we have created many types of hospitals, it is well to remember that the general hospital occupies the center of the stage in the number of patients treated and the importance it has as the training ground for physicians, nurses, and technical personnel, and for the advancement of medical science. Although general hospitals comprise about 40 per cent of all the beds, they admit over 90 per cent of all the patients. The large majority of these hospitals are operated under voluntary auspices."

The Kansas City Medical Journal¹ notes editorially that there is

marked contrast between the calm analysis of hospital problems by Corwin and the breast-beating, political emotion which marked the recent hearings upon compulsory sickness legislation in Washington

This is of significance in view of the National Health Act (S 545) of 1947, which would centralize all "health activities of the Federal Government except those of the armed forces and the Veterans Administration under this Agency" Also, the extensive program for hospital expansion, held up for so long and now beginning to get underway all over the Nation, calls for much careful analysis, in view of the fact that

Of the population of the entire country, 98 5 per cent lives within 30 miles of a recognized hospital It might, therefore, be a better plan at times to invest in improving roads than in building new hospitals ¹

In commenting on the Corwin study, the Lancet⁸ says editorially anent the \$75,000,000 a year to be spent for the next five years for construction of public and other nonprofit hospitals

American opinion remains set against

London, England, Jan 25, 1947, p 148

Jan.-Feb 1947 p 6
 Special Bulletin No 2, Feb 12, 1947, A M.A. Council on Medical Service

nationalization of the hospitals with the implication it carries of a hospital service free to all How is this possible? Voluntary provision has been supplemented, Dr. Corwin explains not only by hospitals maintained at the public expense, as in this country but also by greater development of private and semiprivate accommodation, and by payments by public bodies for indigent patients in nonprofit hospitals. The income from these paying patients is the mainstay of voluntary hospital finance in America, and the system has gone far to enable voluntary finances to weather periods of depression

The system arose because in Colonial days no American hospital had an endowment of any kind voluntary income was considerable but inadequate, and "an American has little if any sympathy with pauperism." Thus the hospital managers determined to establish paying wards, and in the last dozen years or so the phenomenal development of Blue Cross plans have enabled the middle classes to take advantage of the extensive provision of private and semiprivate accommodation

To a much greater extent in the future, American medical practice, both private and public, will undoubtedly center about the hospitals Estimates of postwar hospital needs by various reliable agencies contemplate expenditures between \$200,000,000, and \$300,000,000 yearly for a ten year period. This vast program is indicative of the magnitude of the contemplated provision for necessary construction and expansion. It requires careful planning and integration with medical education and the practice of the future.

While these figures will probably be revised downward as better medicine and surgery reduce the time necessary for inhospital care by improved technics derived from war experience, they still remain as an impressive index of the scale upon which it is necessary to plan an integrated system of medical care for the American people

The book is well worth careful study and thoughtful consideration

Problems Arising in the Treatment of Syphilis with Penicillin. Because of the protean nature of syphilis, determination of the value of any method of treatment is a problem, the solution of which requires many years. It concerns every department of medicine and is of primary interest to every doctor of medicine, from the general prac-

titioners in rural and isolated communities to those in metropolitan centers, no matter how broad or how narrow is the field of the specialty. No region of the human body and no corner of medical practice are so small that syphilis may be disregarded Since it has taken decades to appraise the value of the older remedies (the relative values of some are still controversial) for syphilis, we must retain a patient skepticism through the years concerning the relative value of the new methods of treatment with penicillin. Great progress is being made, but the good results reported today must stand the further test of time

The therapeutic pitfalls encountered during the treatment of 125 patients with various types of syphilis at the Massachusetts General Hospital are reported by William R. Hill. The treatment was with penicillin alone, except that in most patients with interstitial keratitis or neurosyphilis the treatment was supplemented with fever therapy. Penicillin in aqueous solution was given intramuscularly in does of 20,000 to 40,000 Oxford units every three hours, day and night. The total dose varied from 1,200,000 to 2,400,000 units, and the periods of time ranged from eight to fifteen days.

In cases of late syphilis with persistent positive reactions, which had previously received adequate treatment with arsenicals and bismuth, no permanent improvement followed the treatment with penicillin. Results in interstitial keratitis are unpredictable, some patients responded favorably to penicillin alone, while others failed to improve when penicillin was supplemented with fever treatment Other failures of penicillin alone in late syphilis include optic atrophy, deafness, lightning pains, gastric crises, ataxia, incontinence, dementia paralytica, and one case of extensive gumma of the face.

In cases of early syphilis the author found no evidence of resistance to treatment with peniallin when given in the doses recommended and used over a sufficient period of time. The three things essential to success in treating early syphilis (in adults) with penicillin are. (1) the total dose should be of 2,400,000 units or more, (2) it should be administered intramuscularly every three hours day and night, and (3) the period of treatment should be not less than eight days Among 75 patients the relapse rate within ax months was 7 per cent. In relapses in

¹ Hill William R.: New England J of Med. 235 910 (Dec. 26) 1946.

early syphilis, or reinfections, the retreatment should consist of double the previous total dose (or more) with the addition of arsenic or bismuth. The experience of other authors indicates that the lowest incidence of relapse and the best serologic response follows treatment with moderate doses of penicillin, together with moderate doses of mapharsen or bismuth

With penicillin, the incidence of severe reactions is insignificant, but the Herxheimer reaction occurred in 75 per cent of the patients treated for early syphilis There is a rise in temperature of 100 to 103 F within eight hours usually after the sec-The patient becomes sympond injection tom-free in another twelve hours, and therapy need not be interrupted patient who had apparently recovered from a postarsenical jaundice, was given (three months later) 2,400,000 units of penicillin over a period of eight days Jaundice soon reappeared and was followed by a progressively fatal course The postmortem diagnosis was subacute yellow atrophy of the The sensitivity reactions include urticaria as early as the first day, usually during the second week, vesiculobullous or papular eruption (within twenty-four hours) usually followed by desquamation, and transient The vesiculogastrointestinal reactions bullous reaction may require interruption of The maximal safe dose of penitreatment cillin is still undetermined, and the drug appears to be compatible with all other antisyphilitic treatment

One case in this series was masked by previous treatment of gonorrhea with penicilin during the incubation period of syphilis, delaying the diagnosis for six months. Any patient with gonorrhea treated with penicillin should be observed carefully for signs of syphilis during the subsequent six months. Physicians should not use penicilin indiscriminately in the treatment of herpes, mucocutaneous ulcerations, or other similar lesions, without taking the necessary precautions to exclude syphilis.

Every patient treated with penicillin should be instructed in the need for periodic check-ups which should be done carefully and critically, and over a period of time (years) equal to that observed after treatment by the older methods. When caseholding becomes difficult, the services of a social worker should be sought in localities where they are available and, where milder methods fail, the local public health department should be asked to take sterner action. Marriage may be sanctioned after two years

during which the patient has been free of clinical signs of syphilis, persistently serologically negative, and with a negative spinal fluid test at the end of this probationary period

Our justified enthusiasm for penicilin as a mighty weapon against syphilis must be tempered with knowledge of its limitations. In some types of syphilis it is efficient when given alone, in other types the results are far better when penicillin is supplemented with fever treatment or the use of arsenicals and bismuth. The final evaluation of the merits of penicillin in the therapy of syphilis will be hastened by the cooperation of informed patients, inquisitive clinicians, and skeptical doctors everywhere seeking for the evidence of failures.

Physicians in Congress In the S0th Congress there are eight physicians and two dentists, one more physician and one less dentist than in the 79th Congress, says Bulletin No 7,1 of the A.M.A. Council on Medical Service thirty state legislatures there are fifty-three physicians and sixteen dentists, while eighteen states report no physicians or dentists in their Eighteen states have but one legislatures physician, while nine have two physicians serving this year, and three have four, five, and six, respectively The governor of one state is a physician Twelve states have one or two dentist legislators

This report is stimulating and encouraging. We can remember a time when it was not considered "de rigeur" or "genteel" for professional medical hands to soil themselves with the soot of politics.

Now some things have changed for the better. Many absurd and slightly mauve tabus have been laid away in lavender. It is encouraging. Medicine these days is so intertwined with the statutes that the need for physician-legislators daily increases. Apparently that need is being met.

Is this a trend away from specialization in medicine? If so, it would seem to be a good thing in more ways than one. The profession needs more representation in legislative bodies when it is considered to what extent medicine touches the lives of all the people, and how difficult it is for those not previously trained in medicine to interpret the view of the profession. We hope the Council on Medical Service will continue to report on the growth in numbers of physician-legislators.

¹ Council on Medical Service, A.M.A., March 17, 1947

PILONIDAL (SACROCOCCYGEAL) CYST AND SINUS

AN EVALUATION OF SOME OF THE RECENTLY PROPOSED THERAPEUTIC MEASURES

ROBERT TURBLE, M D, New York City

THE purpose of this paper is to review cer tain facts about pilonidal disease which have become evident during the World War II and to indicate the trends in the choice of certain surgical procedures. The knowledge gained during the war from the treatment of pilonidal disease in an unprecedented large number of militarized personnel should help to crystallize our opinions and materially help in the management of this lesion in cryllans.

In my last paper1 the literature was reviewed and the essential aspects of pilonidal disease were discussed It was pointed out that there exists no unanimity of opinion as to the embryologic origin of this lesion. While all authorities agree that pilonidal sinus is congenital in origin and that it arises from the ectoderm, they disagree as to whether skin or neural tissue is the source of origin. There is also a decided lack of agreement concerning surgical therapy Numerous new procedures and modifications of old procedures have been described and good results are claimed by their authors. These results, how ever, are not always obtained by surgeons other than the originators It is well appreciated that surgeons who develop special technics doubtless obtain good results however unless a procedure offers consistently good results in the hands of most, if not all well trained surgeons it will fail of general adoption.

Because of its frequent occurrence in mili targed personnel during World War II, pilonidal disease became a major surgical problem to which serious attention and study was directed as attested by the profusion of publications that emanated from service hospitals. It became apparent that trauma plays an important role in the activation of this lesion * Bule dubbed the term "jeep disease, or pilonidal disease of mechanised warfare". On the basis of clinical observation I believe that hyperhidrous and lack of ideal personal hygiene imposed by training and/or battle conditions play an important factor in the initiation of infection in the pilonidal cvst 4 Of importance in this connection is the finding in the operative specimen removed at the initial operation of hemolytic and nonhemolytic staphylococci and streptococci, some of which are resident organisms of the skin. It is noteworthy that members of the colon bacillus group are notoriously absent in these surgical specimens

Recurrence

The tendency to recurrence following any operation characterizes this lesson It is non almost universally realized that recurrence following an operative procedure is seldom due to overlooked remaining pilonidal sinuses but is often the result of the incomplete obliteration of dead space which has become infected 1.5 Frequently, recurrence is due to the incomplete or inadequate elimination of infected tissue adjacent to the cyst or sinus A very significant consideration of recurrence is the finding of viable and virulent organisms in the tissues of the buttocks about 1 5 to 2 cm from the line of excusion of pilonidal cysts.6 In summary the problem of recurrence is one of infection and poor healing of wound rather than of true recurrence of the original epithelial transe

Operative Therapy

Abscess - Early intervention is practiced Through a generous incision the pus, hecrotic material, and, frequently, tufts of hair are evacuated and the cavity is irrigated with normal saline solution The roof of the abscess cavity is then removed, hemostasis is secured by gentle pressure, and the cavity is packed lightly with gause which had been previously soaked in a solution of peni cillin containing 10 000 Oxford units per cubic centimeter of water The packing is removed in three to four days and the wound is accorded the usual established treatment, namely, hot sits baths, repacking of wound with or without penicillin soaked gauze, and rigid hygiene 4 In spite of excision of a large amount of overlying skin. as is frequently necessary in the case of large abscesses, the wound is usually well healed in about three weeks and the entire convalescence is extremely amouth By comparison with the old method of crucial incision and dramage only. the wide unroofing of the abscess cavity is a far superior procedure Recurrences following three to six months after operation have been absent and subsequent excision of the cyst or sinus has thus far been unnecessary This procedure is also applicable to the treatment of abscesses in other unexposed parts of the body

Cyst or Sinus—In prewar civilian practice excision or block dissection with packing followed by meticulous postoperative care was the most popular procedure, but this entails a prolonged

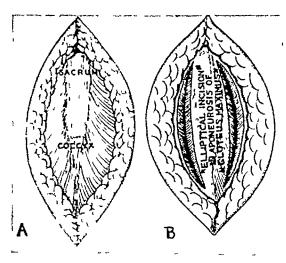

Fig 1 (A) Exposure of sacrococcygeal fascia and aponeurosis of the gluteus maximus after removal of pilonidal cyst and sinus (B) Incision on either side of aponeurosis of gluteus maximus (Incisions at each end of the ellipse may or may not be joined) *

period of healing, which made this operation undesirable in military war practice To restore soldiers to duty as early as possible, Shute, Smith, Levine, and Burch⁵ devised a gluteal muscle and fascial flap procedure which permits primary closure after the radical extirpation of very large uninfected (or previously infected but drained) cysts and involved adjacent tissues with concomitant obliteration of dead space The principles of this operation have been endorsed by Stone 7 The technic is described briefly as follows "A wide, double elliptical incision is carried perpendicularly downward to the fascia of the gluteus maximus The circumscribed tissue block is separated from the sacrococcygeal fascia and removed (Fig. 1A) A lateral incision through the gluteal fascia in the line (depth) of the original incision is now made on either side (Fig 1B) It is deepened into the fibers of the gluteus maximus and the fibromuscular flap thus created is turned medially and sutured to its fellow on the opposite side, in the midline (Fig 2A) This fills in the area dorsal to the sacrum, eliminates the dead space, and furnishes an abundant blood supply to the base of the The lateral flap slides medially over the edge of the sacrum and is sutured to the opposite lateral flap without tension (Fig 2B) The skin is now easily approximated "

It is important to secure perfect hemostasis and to approximate accurately the caudal or the in-

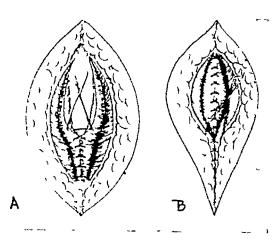

Fig 2 (A) Approximation of inner fibromuscular flaps in the midline (B) Approximation of outer fibromuscular flaps *

ferior end of the wound The former is accomplished by gentle pressure with the aid of gauze or by tying an occasional persistent bleeding (The newer hemostatic drugs, fibrinfoam, and sponges are now being given a trial in these wounds) In spite of all refinements of technic and gentleness of handling of the tissues, collections of serum in the wound occur which may become infected and cause disruption of the wounds and/or sinus formation To prevent the breaking down of these wounds I still most meticulously approximate the lower angle of the wound by the use of a nonabsorbable subcuticular stitch, but in addition I leave the remainder of the wound open for a period of about fortyeight hours with aid of a gauze wick packing is placed just between the skin edges following the introduction of skin sutures which are left untied After the removal of the packing the sutures are tied approximating the skin edges It has been surprising to observe the large amount of hemorrhagic serum in the dressings at this The application of the principle of delayed closure to the middle and upper portions of the wound has not materially increased the time of effective healing as reported in the original paper 5 As already alluded to, only patients with very large uninfected or previously drained cysts with or without multiple sinuses were subjected to this gluteal fascial or fibromuscular flap with delayed skin closure technic wounds of only 4 patients failed to remain closed because of a deep low-grade inflammatory process necessitating wide reopening and packing, these wounds were subsequently treated as primary open wounds and healed quickly and uneventfully

Small or medium-sized uninfected pilonidal cysts have been eradicated by block dissection or

enucleation excision of the cyst or sinus and closed primarily without tension by simpler technics such as that utilized by Gage. The application of sponges over the wound to help obliterate the dead space is a good additional aid to all technics of primary closure.

Berman has recently proposed a new operation which is based on sound principles and is easy of execution. I am now according this procedure a thorough trial

Treatment of Recurrent Cases

Many cases of "recurrent" polonidal disease can be treated effectively by irradiation **.1 I advocated roentgen therapy as a substitute for operation mannly on the basis that recurrence after operation is due primarily to incomplete extirpation of infected tissues at the original operation or to the postoperative occurrence of in feeted granulation tissue I consider radiation therapy a useful military expedient, this form of therapy has found a measure of acceptance by

the Navy " Radiation therapy may fail when sinuses are incompletely removed at the original operation Reoperation then becomes necessary and may be performed without hazard At the reoperation all scar tissue (most of which shows microscopic evidence of variable grades of inflammation) is excised to the sacrococcygeal fascia and the wound is closed either by the flap method just described, or it is left open and allowed to granulate from the bottom, or the raw surface is immediately skin grafted, employing intermediate or thick split-thickness skin grafts 4 Contrary to the general belief, the freshly ex posed area appears to be the best base upon which to place a skin graft Parenthetic ally it may be stated that excision with immediate skin grafting has been performed in primary cases 11 Scarborough was probably the first surgeon to have employed this procedure in 1938 However it should be pointed out that the grafted skin in the sacrococcygeal area cannot withstand the strain incident to full military physical duty status or corresponding stress and strain in civilian pursuits, the grafted skin is affected enaily (excoriation, fissures) by slight trauma 4

Anesthesia

Local infiltration anesthesia produces a higher incidence of complications than regional or general anesthesia and thus is responsible for a longer period of hospitalization. These observations are supported by Brockbank and Floyd¹³ who have recently reported six severe infections following local anesthesia and none following spinal anesthesia. These authors also observed that following spinal anesthesia the average period of hospitalization was twenty-one and one-tenth days, while that following local anosthesia was forty-six and eight-tenths days

Chemotherapy

The oral administration of sulfonamides such as sulfadiazine, prevents wound infection.¹³ In view of the finding of hemolytic and non hemolytic staphylococci and streptococci in the operative specimens removed at the primary operation, and the finding of viable and virulent organisms in the tissue juices of the buttocks for a distance of about 2 cm from the area of excision of pilonidal cysts and sinuses, I now administer penicillin and/or sulfonamides before and after operation, especially in the complicated cases.

It may be reported here in a preliminary way that peniculin therapy administered early for cellulitis in the sacrococygeal area which in the past usually terminated in frank suppuration will

^{**} The injection of selerosing solution with penicillin also has real merit (8ha@roff B G P and Doubllet H.: New York State J Med. 46, 801 (April 15) 1946)

prevent abscess formation in a certain number of cases 4 Large doses of the antibiotic-30,000 Oxford units every two hours for three days administered intrimuscularly—were required frequently, the sublingual route of administration employing 50,000 units of penicillin every two to three hours was utilized 4 In the absence of penicillin-resistant organisms, failures appear to be chiefly due to (1) the presence of a clinically unrecognizable deep suppuration at the time of institution of penicillin therapy, or (2) thromboses of the vessels preventing the penicillin from reaching the lesion

The local application of sulfonamides to open wounds is at best of questionable value, sulfonamides incorporated in the wounds are undesirable in primary closure technics 5

Summary

- The etiologic significance of trauma, hyperhidrosis, and lack of hygiene in the activation of pilonidal disease is stressed
- Of significance is the finding of hemolytic and nonhemolytic staphylococci and streptococci in the surgically removed specimens and of viable and virulent organisms in the adjacent These bacteriologic obtissues of the buttocks servations suggest the advisability of preoperative and postoperative employment of penicillin and/or sulfonamides
- Penicillin has been effective in preventing abscess formation in a certain number of cases of cellulitis of the pilonidal area

- Frank suppuration is best treated by unroofing the abscess cavity
- Perfection of a primary closure technic for the cure of pilonidal cyst and sinus is the ulti mate goal in the surgical treatment of this Small and medium-sized lesions can be effectively closed by simple primary closure technics For the large cysts the gluteal fascia flap operation combined with the herein proposed delayed closure of the wound is a very satisfactory procedure
- Excision of the pilonidal lesion with im mediate skin grafting has definite but limited usefulness

BIGGEST PROBLEM AT A.M A SESSION IN 1848 WAS EPIDEMICS

When the American Medical Association held its first annual meeting in Baltimore, May 2, 1848, one of the principal points of discussion among the physicians was the progress of epidemics

In writing a history of the American Medical Association in connection with the centennial celebration in Atlantic City, June 9 to 13, Dr Morris Fishbein says that the doctors of that time were especially concerned with the frightful condition of emigrants coming from Europe

"The Committee on Medical Practice," Dr Fishbein writes, "called attention to the fact that thousands had perished on voyages to the United States and Canada From one ship, the Virginia, bound from Laverpool to Quebec, with 470 passengers, 158 were buried at sea

"During the year 1847, 100,000 souls left the British Isles for Canada More than 5,000 of these died en route and another 8,000 within a few weeks after their arrival

"The disease from which these people perished was typhus in its genuine form, and in some ships smallpox, dysentery, and measles swelled the amount of mortality There was much discussion of the ability to distinguish between typhus fever and typhoid fever "

The history of the AMA is appearing serially in the Journal of the American Medical Association and will be printed in book form for the Atlantic City meeting —American Medical Association News, January 30, 1947

ON THE USE OF A MEDICAMENT TO REDUCE THE APPETITE IN THE TREATMENT OF OBESITY AND OTHER CONDITIONS

WILLIAM L GOULD, M.D., Albany New York

NO ONE ever got fat because he ate too little On the contrary, many people are obese because they eat too much. Not that obesity is due only to overindulgence, for, as we know, it may also come from glandular dysfunction and other pathologic conditions

Not only in obesity, but for other causes as well it may be necessary to diminish food intake For example, in cholecystitis gastric ulcer, myocarditis hypertension, nephritis, diabetes etc it frequently becomes necessary to make sure that one does not overent specifically or generally The food intake must be controlled. With these various conditions, considerable difficulty may be encountered because the patient s appetite cannot be appeased so readily Because of this difficulty, the entire therapy may become disorganized.

In the case of obesity, it would be better to thwart the appetite in the first instance rather than to use metabolic stimulants to oxidize the excessive weight as a last resort. Prevention is no different in this case than it is in any other con dition Furthermore, the therapy required etiologically for the prevention would be much less harmful than the more drastic medicaments frequently employed to treat the end results

Flavettes* is prescribed to curb the appetite rather than as an obesity tablet. It may be used in any condition where a diminution of any of the food intake is required. It is not contraind: cated in any of the above-mentioned conditions In gastric ulcer benzocame has been prescribed for

its allaying ability

Thyrold, amphedamine benzodrene, and other metabolic stimulants are frequently used in obesity cases The continued and indiscreet use of these may prove very harmful. These are drugs with potent actions and considerable care and guidance in administration is required are often used, because there are no suitable comparatively harmless substitutes. Also they are used frequently to treat the end results rather than the causative factors.

With this in mind for the past several years I have been working on various medicaments that might curb the appetite. I tried many kinds of drugs I found that in curbing the appetite the flavoring vehicle of the medicament frequently sufficed rather than the drug itself This resulted in experimentations with various mixtures

It was not my intent to make obnoxious mix tures that would be distasteful and in this fashion diminish the appetite Instead, the flavoring extracts were mixed so that they would not be unpleasant, but would give the desired of fect of diminishing the appetite. The mixture that I found most suitable was a 5-grain non coated tablet or lozenge made of the following saccharin, extracts of heorice, powdered ganger, oils of anise, wintergreen, peppermint, corn ander and cloves

The instructions given were to place the tablet or lozenge on the tongue fifteen minutes before eating, so that it would be dissolved by the time the food was taken In the first 100 cases, the appetite was reduced moderately in 39 of the in dividuals while not much appreciable change was shown in the other 61

The difficulty was that there was not a sufficient lasting quality to the losenge. It was necessary to add something that would have a more prolonged effect throughout the meal Here again various medicaments were tried and the best results were secured with 1/20 grain bensocaine added to each 5-grain tablet. With this combina tion, the results doubled so that in 568 additional cases 80 per cent had their appetites considerably curbed The Flavettes thus became a combination of the flavoring extracts enhanced by the delaying action of benzocaine

In this series of cases, each patient had a complete physical examination, including blood pressure, hemoglobin Wassermann, and in 80 per cent of the cases, a basal metabolism rate and in 80 per cent of the cases, an electrocardiogram The patients were observed on the average of every ten days, at which time they were rechecked and re-examined Where the basal metabolic rate was less than -15, thyroid ex tract was given in addition to the lozonges Those whose metabolic rate was better than -15 were given lozenges without any thyroid the obesity cases, the average loss of weight was 11/2 pounds per week. Gradually increased

of flavoring extracts, until the most suitable one was found It is well known that even the choicest of foods when mixed unfavorably will not appeal to the appetite For example, a steak sea soned with salt, pepper, and onions is appealing, but with a dash of chocolate syrup it would not prove appetizing There would be nothing harm ful in this mixture. It just would not appeal to the taste, and the appetite would thus be curbed

I have designated these tablets as Flavettes," because of the various flavoring agents employed. They are marketed by Flavettee Capital Station Albany N Y

walking, except in cardiac cases, was the only required exercise. Aside from the Flavettes, specific therapy was given for the specific ailment involved, as myocarditis, cholecystitis, nephritis, diabetes, etc.

Flavettes were not only taken before each regular meal, but also whenever the patient had a desire to eat anything between meals. In this fashion, anywhere from three to six tablets were consumed daily. The housewife, frequently tempted during the cooking chores, found the tablet a considerable aid.

It readily may be seen how harmless this medicament is compared to the metabolic stimulants frequently used. In my series of cases, these drugs were never employed unless the metabolism test indicated their use, which was in 8 per cent of the cases.

As for untoward results, in 2 per cent of the cases patients complained of a disagreeable taste to the extent where they could not take the lozenge. There was never any nausea or vomiting, nor any signs of toxicity, even though the medicament was taken by individuals anywhere from several weeks to one and one-half years. Some of the individuals, even after their weight was reduced to the desired amount, took the lozenges at times just to keep their appetites under control. It was noted that after taking the lozenge two or three days, there was a slight decrease in appetite and that after seven to ten days there was an appreciable decrease.

From the composition of the lozenges, it may be noted how comparatively safe they are. The flavoring extracts in such minute amounts certainly can do no harm. The amount of benzocaine in an entire bottle of three-weeks' supply (63 tablets) is only a little over 3 grains. The USP dose of benzocaine is 5 to 8 grains. Thus, if one accidentally took the entire contents of the bottle, it should prove harmless. How different it would be if such an accident occurred with any of the metabolic stimulants frequently used! Flavettes may be used with metabolic stimulants as may be necessary when there is glandular dysfunction.

It was found that 1/20 grain of benzocame was sufficient to curb the appetite. At first more was used, but the amount was gradually decreased until the desired effect was obtained. It should be remembered that the benzocame is used here for its prolonging and enhancing value on the flavoring extract combination. That is why such a small amount is sufficient. In the small percentage of cases in which the lozenge was distasteful, these patients were permitted to swallow the tablets directly. In these cases, it was found that the appetite was similarly decreased, so that it cannot be claimed that the medicament

works well only on the first phase of digestion with the taste buds and salivary glands of the mouth

The amount of benzocaine used was not sufficient for a complete physiologic response, because a real anesthesia was not sought. The desired end result of curbing the appetite is all that was looked for and secured with these small percentages, not only of the benzocaine, but also the flavoring extracts. In this fashion, we have a medicament that may be fairly freely used in some rather important conditions. The value of curbing the appetite cannot be overemphasized, for unless this is done, unfavorable complications frequently arise.

This medicament is not an "obesity tablet" but one that is used to curb the appetite regardless of the clinical condition, whether it be cholecystitis, myocarditis, nephritis, gastric ulcer, glandular dysfunctions, obesity, etc

Case Histories

In the cases of obesity all were placed on a diet containing under 15 per cent fats and carbohydrates. Multiple vitamin capsules were prescribed in each case to make up for any defaciency. Except in cardiac cases graduated walking was prescribed, beginning with short walks and gradually increasing the distance.

In the obesity cases, the weight was maintained at its level for three or more months. In each of the instances, a weight range of five pounds was given at the desired level. For example, if the desired weight was 135, a weight range of 133 to 138 was given. When the weight was 133 or 134, the patient ate almost everything, using some discretion. When the weight approached 138, the diet was more restricted again and Flavettes were taken as necessary to counteract any increased appetite. In this fashion, the patient was able to maintain his or her own weight level.

In cases other than obesity, the particular conditions were specifically treated

Case 1 —Mrs L C, age 45, a housewife, with one child, had chief complaints of ravenous appetite, and increased weight for one year from 125 to 143 She had irregular menses, no flashes, but was nervous and tired readily Physical examination showed her to be of moderate obesity, weight 143, blood pressure 96/82, urine negative, basal metabolic rate $-12^{1/2}$ electrocardiogram showed a bradycardia with a pulse of 56, hemoglobin 70 per cent Treatment had been one Blaud's mass tablet before each meal, stilbesterol, 01 mg daily After taking Flavettes for two days, there was a slight decrease in the appetite that continued decreasing, so that in seven days After this, the there was considerable reduction patient was better able to control her diet was a loss of 1 to 3 pounds a week so that in nine weeks the patient weighed 125 pounds stage, the diet was under normal control and the

weight had been maintained at this level for three months. The patient had a feeling of well being The pressure now was 120/72, hemoglobin, 82 per cent, and pulse 64 Diagnosis glandular dysfunction, bradycardia, hypotension, anemia, obesity

Case 2 -Mrs. F B., age 42, a housewife with 2 children had chief complaints of uncontrolled appetite, dyspnea, palpitation cough, and wheezing After taking Flavettes for four days, there was a slight decrease in the appetite, in eight days there was a considerable decrease. Flavettes are taken now occasionally only as necessary to control any in crease in appetite This is a case of hypertension chronic endocarditis chronic myocarditis bronchial asthma. These conditions were treated specifically

Case 3 -Mrs H J M a waitress age 43, married with one child, had chief complaint of having gained 30 pounds in the past year Physical examination weight 177, blood pressure 134/76, hemoglobin 75 per cent, urine negative basal metabolic rate +7 Four days after taking Flavettes there was a moder ate diminution of appetite, nine days after con siderable decrease In three months weight was reduced to 147 1/2 Diagnosis obesity

Case 4 .- Mrs E. M a clerk age 35 married with no children began to reduce with Flavettes in May, 1946 Her weight had been 234 pounds and fell to 2081/2 pounds. She had violated her diet several times After taking Flavettes for three days there was a slight reduction in appetite and con siderable decrease after six days After four months blood pressure went from 162/102 to 130/74, hemoglobin 75 per cent to 84 basal metabolic rate -81/2 to -3 Diagnosis obesity

It was noted that the blood pressure curve frequently followed the weight curve

Case 5 -M N single, age 26 s maid, weighed 190, and reduced in ten weeks to 167 Blood pressure, originally 176/07 was reduced to 130/70 Basal metabolic rate was +41/1, urine, negative hemoglobin, 02 to 80 per cent After taking Flavottes for three days her appetite decreased, there was considerable decrease after nine days nosis obesity anemia.

Case 6 -Mrs S O age 57, a housewife with one child had difficulty dieting for her conditions. After taking Flavettes for four days, there was a slight reduction in appetite, and considerable decrease after eight days. This case was diagnosed as multiple osteoarthritis, chronic cholecystitis, hypertension

Case 7 -Mr J B, age 56, had difficulty in main taining his gastric ulcer diet. Within one week Flavettes curbed his appetite so that he could more rendily remain on his specific diet

Case 8 -Mrs. H. S, age 59 had a ravenous appetite that caused frequent violations of her diabetic diet After taking Flavettes for ten days, the diabetic diet was readily maintained

Summary

The need of a comparatively harmless medica ment to curb the appetite, either specifically or generally, is frequently desired in cases of cholecystitis, gastric ulcer, myocarditis, hypertension nephritis, diabetes etc. The prolonged and indiscreet use of metabolic stimulants may be harm ful and were given at times because there was no comparatively harmless substitute Flavettes containing 1/20 grain of bensocaine aromatized with suitable flavoring extracts, has been found successful in curbing the appetite in 80 per cent of 568 cases

THE ROSENSTOCK MEMORIAL FOUNDATION FELLOWSHIPS

The Rosenstock Memorial Foundation Inc. And rosensuck Memorial Foundation Inphalathropic foundation for the purpose of fostering
individual medical research without regard to race,
creed, color or ext, is offoring three fellowships of
\$2000 per annum renewable upon reapplication
and favorable reconsideration for an additional year.

The grant and half-day the surround of individual The grants are limited to the support of individual medical research to be conducted in hospitals with medical school affiliations in any of the five boroughs of New York City Fellowships may be granted either for full-time or part-time medical research

Fellowships will be limited to those who apply

within three years of the completion of internship or rendency (excluding time spent in military service) except that a recipient of the fellowship may reapply for one renewal of the grant. Applications must be endorsed by the director of the hospital where it is proposed that the research shall be conducted, and forwarded by the endorser to the Foun dation at 42-16 West Street, Long Island City 1 New York, by October 1 1947

Announcements of grants will be made in De-cember, 1947, and the funds will then be turned over to the hospitals involved.

OFFICE PROCEDURE IN APPLYING PENICILLIN THERAPY TO ACUTE SUPPURATIVE BARTHOLINITIS

Morris A Goldberger, MD, and Louis S Lapid, MD, New York City

(From the Gynecological Service of the Mount Sinai Hospital)

X E WISH to report a simple office procedure in the management of acute suppurative bartholinitis Realizing that incision and drainage is still the procedure of choice in local suppurative processes, we have, nevertheless, aspirated the Bartholin abscess and injected penicillin directly into the cavity with gratifying results

Three cases so treated all complained of an exquisitely tender local vulvar mass, extreme difficulty in walking and sitting, and generalized discomfort

They all encountered immediate relief upon aspiration and had no complaints within the hour One of the 3 patients had to be reaspirated twenty-four hours after the initial procedure because of the reaccumulation of pus in the cavity, this patient received 100,000 units of penicillin The 2 cases in which we encountered initial success received 200,000 units of penicillin in one in*iection*

Technic

The vulva is cleansed with soap and water local or topical anesthesia is necessary ber 18 gage needle is inserted into the cavity of the abscess on the mucosal surface of the vulva and the pus aspirated with a syringe Leaving the needle in situ, the syringe is removed and replaced by another one containing 200,000 units of penicillin dissolved in 10 cc of normal saline, and its contents slowly injected. A piece of gauze is held over the point of needle entry for a short while

Case Reports

Case 1 -M S is a 29-year-old woman, para 1, gravida 1, with a chief complaint of pain, swelling, and redness of the left labial wall, and difficulty in She had a local walking of eight days' duration mass in the left labia which never bothered her during two years Gynecologic examination revealed a tense, fluctuant, painful swelling of the left labia majora about the size of a lemon The abscess was aspirated and 8 cc of purulent fluid removed, 100,000 units of penicillin were injected. Twentyfour hours later the mass reformed but was less painful than on admission Sixteen cc of purulent fluid were aspirated and 200,000 units of penicillin in jected into the cavity. One day later there was no evidence of any local inflammatory process

Case 2 -D D is a 55-year-old woman, para 4, gravida 4, who complained of an abscess of the right vulva of nine days' duration She had taken hot sitz baths with no relief The patient encountered extreme difficulty in walking and complained bitterly of local pain Gynecologic examination revealed a swollen, tender, fluctuant mass the size of a plum in the right labia, with diffuse edema surrounding the mass with obstruction of the vagina Eight cc of seropurulent material were aspirated and 200,-000 units of penicillin injected directly into the Twenty-four hours later there was no evidence of local inflammatory process

Case 3 -M C 18 a 35-year-old woman who complained of pain of the left labia and difficulty in walking of three days' duration Gynecologic examination revealed a lemon-sized mass of the right labia This mass was red, with evidence of fluctuation present Three cc of pus were aspirated and 200,000 units of penicillin injected Thirty-six hours later there was no evidence of local inflammatory process

Summary

The procedure of aspirating a suppurative Bartholin abscess cavity with the injection of penicillin therein gives the patient immediate relief and specific therapy simultaneously

Patients are not subjected to a minor operative procedure of incision and drainage with its postoperative care and longer reparative proc-

ess

Within forty-eight hours there is no evidence of any inflammatory process in any of the patients so treated

ANNUAL MEETING, AMERICAN COLLEGE OF CHEST PHYSICIANS

The Thirteenth Annual Meeting of the American College of Chest Physicians is scheduled to be held at the Ambassador Hotel, Atlantic City, New Jersey, June 5 to 8

An interesting scientific program has been planned for this meeting. Prominent speakers from other countries will present papers

The oral and written examinations for Fellowship will be held on the first day of the meeting,

June 5 Applicants for Fellowship in the College who plan to take these examinations should communicate at once with the Executive Secretary, American College of Chest Physicians, 500 North Dearborn Street, Chicago 10, Illinois

The convocation for new Fellows and Lafe Members of the College will be held on Sunday June 8

bers of the College will be held on Sunday, June 8 At this time certificates will be awarded to Fellows and Life Members admitted since June, 1946

PATHOGENESIS OF SPINA BIFIDA AND RELATED CONGENITAL MALFORMATIONS*

ALEXANDER S WIENER, M D, Brooklyn, New York

(From the Blood Transfusion Division Jewish Hospital of Brooklyn, and the Serological Laboratory of the Office of the Chief Medical Examiner of New York City)

X/HILE certain anatomic anomalies such as polydactylism, brachydactylia, ectopia lentis, and albinism are transmitted heroditarily in accordance with the Mendelian laws, other anomalies, such as spina bifida, cleft palate harelip and congenital amputations, do not seem to follow the Mendelian laws. The suggestion that developmental anomalies of the latter variety are due to accidental amniotic adhesions or to fortuitious trauma from bands of amniotic tessue fails to account for the familial incidence in some of the cases. Since isosensitization of the mother to antigens present in the blood of the fetus can injure the fetus when maternal anti bodies pass into it through the placenta, it seemed worth while to investigate the possible relationship between isosepsitization and con genital malformations as has been suggested by Levine. This idea is supported by reports from the literature 1-8 that there is a higher than nor mal incidence of congenital malformations among erythroblastotic infants. In a previous article 6 reference has already been made to a connection between spina bifida and erythrobiastosis fetalis.

In the present article the evidence for such a relationship will be presented in detail, and a new theory of pathogenesis of such congenital abnormalities will be proposed

Materials and Methods

The cases which form the basis of this article (Table 1) are part of a larger series referred by numerous physicians for investigation for the possible presence of isosensitization. The cases selected include all those families in which one or more fetuses or infants exhibited some con genital anatomic abnormality, but otherwise they constitute a random series, except that in two cases (Cases 11 and 12) the patients were referred also because previous tests had shown them to be Rh negative In the most recently studied cases the bloods of both parents and all available living children were completely classified for the AB Landsteiner blood groups for the M N types, and for the Rh-Hr types. The maternal sera were also tested for the presence of anti Rh, anti-A, anti-B and other antibodies the sera being titrated by both the ag glutination and con lutination technics s-11. The data in a number of the older cases were incomplete according to our present standards and in some cases the anti A and anti B titers were determined only by the agglutination method on well-slides.

In the titrations of the alpha and beta antibodies fresh saline suspensions of the washed red cells from individuals of groups A₂ and B were used throughout. In the conglutanation tests fresh group A plasma was used as the source of conglutinin when titrating the alpha antibody, fresh group B plasma for titrating the beta antibody. For purposes of comparison it may be mentioned that under these conditions the average normal titer of the alpha and beta iso-antibodies is approximately 50 units by the tube agglutanation method and 10 units by the well-slide method. In normal individuals, the conglutination method yields titers no higher—usually lower—than the agglutination method

When determining the anti Rh content of a serum, fresh saline suspensions of group O bloods of types Rhi, Rh; and rh were used For the conglutination tests, pooled fresh human plasma was used as the source of the conglutinin While the blood group of the plasma was disregarded, the precaution was taken to use only plasma from Rh-positive individuals, because two instances have been encountered in which plasma from presumably normal Rh negative male donors contained weak univalent Rh antibodies which interfered with the Rh antibody tests.

Results

Cases 1 and 2 in Table 1 show the simultaneous presence in the same family of spina blifda and erythroblastosis fetalis. In both families, the mother is Rh negative and sensitized to the Rh factor. In Case 1 there is a double incompatibility because the mother is also strongly sensitized to the agglutinogen B. Cases 3.4 and 8 are families with spina blifda but without an associated history of crythroblastosis fetalis. In one family (Case 8) the mother is Rh negative and her serum contains Rh antibodies while in the other two families the mother is strongly sensitized to the agglutinogen B. These results

^{*} Alded by a grant from Mr Harry R. Socolof

therefore, indicate that isosensitization can in some way cause spina bifida in the fetus

In Case 5 an erythroblastotic infant also had a diaphragmatic hernia, in this case the mother was Rh negative with Rh antibodies in her serum In Case 6 sensitization to the B factor appears to have caused a stillbirth with a cleft palate and harelip. In Case 17 the cause of the encephalomyelocele remains uncertain, because while the mother is Rh negative (type rh') no clear evidence of Rh sensitization could be obtained. Perhaps one of the newer, more sensitive methods of performing the conglutination test¹¹⁻¹² would have revealed the presence of Rh antibodies in this patient's serum. A similar situation exists in Case 11, where a stillborn fetus was found to have its kidneys missing.

Case 3 illustrates the well-known relationship between spina bifida and hydrocephalus Therefore, it is of interest that in Case 19, in which there was a hydrocephalic stillbirth, it was possible to demonstrate the presence of univalent alpha and beta antibodies in the maternal serum, proving that she had been isosensitized. Still another example of Rh sensitization is Case 10, but here the exact nature of the monstrosity is not known.

With these cases may be contrasted the families in which anencephalic monsters occurred (Cases 9 and 12), and the families in which congenital blindness was encountered (Cases 14 and 15) Here no evidence of isosensitization of the mother could be demonstrated In one of the families with congenital blindness the parents were first cousins, and in the second family the parents were second cousins, suggesting that the condition was genetically determined, probably by means of recessive genes In another family (Case 16) where two infants died of Oppenheim's disease, likewise no evidence of isosensitization could be adduced Nor could this mechanism be invoked in an instance of severe congenital

Exprincipations (stells

Exprincipations)

Expressive indicated all titrations were made in tubes as follows: A series of progressively doubled dilutions of the serum were prepared and one drop of each dilution transferred to the corresponding tubes in a sense of ampty tubes. To each tube of the latter was added a drop of a 2 per cent suspansion of the test cells. After one hour s incubation in the water bath at body temperature readings were taken (aggiudination tests). The tubes were then centifyed, the suspensation fluid completely removed and replaced by a drop of oralized plasma. The sediment was resumended by vigorous shaking and readings taken a second time after another hour's incubation in the water-bath (conglicitation) entered.

heart disease (Case 18) Thus, isosensitization produces only particular malformations, and not every abnormality occurring in the newborn should be ascribed to this mechanism."

Comment

Javert's reported that in his series of erythroblastotic infants and fetuses congenital malforma tions occurred about 40 times as frequently as in a comparable series of cases without erythroblastosis. The malformations he listed include harelip and cleft palate spina bifida, hydrocele, supernumerary fingers, corvical rib urethral stricture and an interventricular septal defect The observations described in this paper corroborate the correlation between particular malformations and erythroblastosis fetalis especially spina bifida and hydrocephalus, and demonstrate the importance of maternal isosensitisation in producing these conditions even when these anom alies occur in families without clinical evidence of erythroblastosis fetalis Penrose^{14,15} has reached the same conclusion by indirect statistical analysis of families with congenital malforma-

As for the mechanism by which isosensitization produces congenital malformations, the following hypothesis is suggested. As has been pointed out in previous papers 11 16 the antigen-antibody reaction in the body of the infant or fetus may give rise to two effects namely, intravascular hemolysis, and intravascular clumping of the fetus's erythrocytes (agglutination or conglutination) To explain the production of con genital malformations the latter action of the antibodies is invoked. If early in the development of the fetus intravascular clumping of the fetal red cells interferes with the circulation in terminal blood vessels to localized regions, it is not difficult to conceive how this may prevent closure or "healing" thus giving rise to such defects as harelip and cleft palate, spina bifida, disphragmatic hernia, and so forth. If necrosis of an anlage of a limb or an organ is produced by

this mechanism, it is easy to see how an infant with congenital amputations or with absence of the kidneys could result The process would have to take place early in pregnancy, at a time when the placenta is still relatively impermeable to the passage of antibodies It therefore becomes necessary to postulate the fortuitious occurrence of a defect in the placental barrier, for example, by infarction or premature separation, permitting the passage of antibodies from mother This additional requirement may serve to explain the sporadic incidence of these malformations, so that only occasionally is more than one case found in the same family

Summary

Cases are described which illustrate the association between particular congenital malformations and erythroblastosis fetalis Evidence is presented which indicates that these malformations result from maternal isosensitization, and also in families without clinical erythroblas-

It is suggested that the lesions are protosis duced by blockage of terminal blood vessels in the fetus early in development by clumps of erythrocytes, resulting in such malformations as spina bifida, cleft palate and harelip, diaphragmatic hernia, congenital absence of kidneys, and congenital amputations

A.M A. TO LAUNCH ANOTHER COMPLETE SURVEY OF MEDICAL SCHOOLS

"On recommendation of the Council on Medical Education and Hospitals of the American Medical Association, the Board of Trustees has authorized a new complete survey of the medical schools," according to an editorial in the January 11 issue of the Journal of the American Medical Association

The American Medical Association has approved medical schools since 1907 and its list of approved schools is accepted by licensing boards, hospitals, and other agencies for determining the acceptability of

graduates

The editorial states that the "American Medical Association will undertake the entire financial responsibility for the survey However, a collaborative effort with the Association of American Medical Colleges and the individual colleges is planned, so that the project can achieve the end of improved medical education in this country

"Ten years have passed since the last previous complete survey was made, under the direction of H G Weiskotten, now chairman of the council. In the meantime there have been tremendous impacts on the entire structure of medical education, during the troubled war years and in the present era of reconversion to peacetime education. In the light of recent advances in medical knowledge and the nature of medical care a careful re-evaluation of the curriculum is needed Financially many schools are facing a crisis, since the increased income of the war years will be drastically reduced unless supplemented by funds from endowment, state, or other sources There is need for a thoroughgoing analysis of the educational resources of our medical schools as related to student enrollments

"The aim of the survey will be that which has motivated every activity of the council in the past to improve medical education and to render all assistance to medical schools to improve themselves, so that the quality of medical care in this country will continue to improve and the position of world leadership in medical education occupied by the schools of this country will be maintained and strengthened"

THE SYMPTOMATIC TREATMENT OF HAY FEVER WITH DIAMINOBENZOPYRIDYL HCL (N' PYRIDYL N' BENZYL N DIMETHYLETHYLENEDIAMINE HYDROCHLORIDE), (PYRIBENZAMINE)*

HARRY LEIBOWITZ M D I MAXWELL KURTZ M D and EMANUEL SCHWARTZ M D F A C P Brooklyn New York

(From the Division of Allergy of the Department of Medicine The Long Island College Hospital)

VON PIRQUET' in 1908 emphasized the close relationship between anaphylaxis and allergy 7 insser et al. 2 state that there is a great similarity between allergy and anaphylaxis, and that in reality they are probably one and the same manifestation. Dale and Laidlow' in 1911 advanced the histamine theory of anaphylactic shock. Roche e Silva and Essex' removed the adrenals from guinea pigs and found an increase in the degree of emphysema after the injections of trypain. They concluded the main liberation of histamine takes place when antigen comes in contact with lun? tissue

Kellaway and Trethewie assert that the anaphylactic response of smooth muscle is a consequence of the release of histamine Katz and Cohene used heparmized blood collected from persons with allergies to pollen and dust and the specimens were placed in vitro with extracts of their respective allergens. A definite shift of histamine, previously bound to cells, to the plasma was observed The increase of histamine in the plasma ranged from 168 per cent to 900 per cent. Ramires Lawton and Dragstedt' found that injections of trypsin produced in creased amounts of histamine in the blood Rose concludes that allergic patients show great fluctuations of blood histamine in the course of many months or years compared to that occurr ing in normal persons McElin and Horton feel that the common denominator of the allergic diseases is an underlying problem of edema provoked by local release of histamine or a histaminelike substance The edema is recognized in the mucous membrane at certain seasons of the year, i.e., during the hay fever season. With our present knowledge it seems that the histamine released into the tissue spaces produces a capil lary dilatation and an increased permeability of the capillary walls, causing a localized edema.

A systematic search for clinically effective antihistaminic substances was begun only in 1937 Amino acids like arginine histidine and cysteine were shown to have certain antihistaminic and antianaphylactic activities:18-14 Histamine 13-14 histamine azoprotein 17 and histaminaso 14 also have been thoroughly studied for their antihistaminic and antianaphylactic properties. However, none of the above substances have any marked therapeutic effect in vivo and are inactive against histamine poisoning and anaphylactic shock.

Bovet and Staub¹⁸ in 1937 and Staub²⁸ in 1939 examined a great number of chemicals and found only two which had an unusually high antihistaminic activity. These substances, thy movethyldiethylamine and n'-phenyl n'-ethyl, n-diethylethylendinmine, were designated 929F and 1571F respectively.

Another substance known as 2339RP, or dintergan was found by Halpern²¹ in 1942. This drug was used by European workers for the treatment of various allergic disorders with promising results. More recently Loew et al. 22,21 described a series of benzhydryl ethers and amines. One of these, benzhydryl ether hydrochloride (benadryl) was discovered to be the most potent antihistaminic and also the least toxic.

Mayer Huttrer and Scholz¹⁴ investigated several amino pyridyl and amino picoline derivatives related to 1571F They found that one of these, n-dimethylethylenediamine was the most active antihistaminic, and the least toxic. Mayer¹⁴ compared the antihistaminic and antianaphylactic properties of these recently synthesized substances. He concluded that pyribenzamine was the most effective. It was highly active in vitro and in vivo against histamine poisoning as well as in vivo in anaphylacis.

Arbesman and his associates found that pyribensamine (1) has potent antianaphylactic activity in guines pigs, (2) has no demonstrable effect on precipitin titer (3) has no demonstrable effect in the complement titer of guines pigs, (4) decreased the size of histamine skin wheals in 18 of 28 subjects, (5) diminished the skin reactivity in 14 of 24 allergic patients, (6) reduced the reactivity of akin sites passively sensitized with serum containing cottonseed reagms. Toxicity experiments in animals revealed the most out

Purnished through the courtesy of the Ciba Pharmaceutical Company

standing toric symptoms were excitation, con-A marked local vulsions, or marked depression tissue necrosis followed the use of concentrated solutions hypodermically This drug has some features in common with local anesthetics Abresman and Koepf (in an article to be published) relate their treatment of 277 patients suffering from various manifestations of allergy Many of them received pyribenzamine for as long as mine months with no effect on blood components, blood pressure, blood chemistry, and At times as much as 1,000 mg were given without toxic symptoms Of 140 patients with hay fever, 119, or 85 per cent, had relief of In 30 patients with seasonal bronsymptoms chial asthma (grasses and ragweed) 14 (46 6 per cent) had relief of bronchial symptoms Twentyseven (58 7 per cent) of 46 patients with extrinsic (nonseasonal) allergic rhinitis were benefited by this drug Only 25 per cent of those with extrinsic (other than pollens) asthma were im-Six of 14 patients with perennial (intrinsic) allergic rhinitis obtained relief drug was effective in many cases of acute and chronic urticaria Two patients had a physical allergy to cold and would develop urticaria and angioneurotic edema Patch tests with ice cubes produced a wheal Fifty and 100 mg of pyribenzamine given one-half hour prior to the patch test would prevent formation of urticanal Lakewise, with continued use of the drug, these patients would be comfortable when exposed to cold Pyribenazmine was given with good results to additional patients who were sensitive to cat dander, dog dander, rabbit dander, and coffee

Intravenous administration of pyribenzamine presently is not recommended. In dogs it results in acute hypotension. The most common side-effects in patients were nausea, drowsiness, fatigue, an "all gone feeling," dizziness, faintness, and headache. On the other hand, a few patients complained of palpitation, nervousness, insomnia, and dryness of the mouth. Of 277 patients 95 (34 per cent) complained of side-effects, and in 15 (54 per cent) they were found severe enough to necessitate discontinuation of the drug.

It is interesting to note that Yonkman and coworkers²⁷ studied the effect of pyribenzamine for histamine skin wheals in albino rabbits and found that I mg per kilogram administered intravenously had a constant antihistaminic effect on the wheals, whereas when pyribenzamine was given orally, 250 to 400 mg per kilogram were needed to produce the same effect. This suggests that lack of absorption of adequate amounts might explain the uncertain effects noted in human beings

The mode of action of all these antihistamine drugs is still unknown. They do not combine with or destroy histamine, nor do they activate histaminase. The most recent hypothesis is that these antihistamine substances displace histamine from its point of action in the same way that sulfonamides are supposed to displace para aminobenzoic acid.

Personal Observations

This report demonstrates the use of pyribenza mine hydrochloride in a series of 86 cases of ha fever due to ragweed during the 1946 seasor We divided our series into three groups 1 Patients in this group received pyribenzamin plus an injection of a placebo (Coca solution) Group 2 Patients in this group received pyr. benzamine plus desensitization to ragweed Grou Patients in this group received only deser sitization to ragweed, and were carried along pri seasonally as outlined, the pyribenzamine adde at the onset and continued throughout the seasor The dosage used was 50 mg given orally two daily, after breakfast and before bedtime. It creasing the dose to three and four tablets a da in cases not obtaining relief did not in any wa bring results It was our experience that whe relief was obtained two tablets a day wer sufficient

TABLE 1—RESULTS OF TREATMENT OF PATIENTS IN TE

Group 1	Number of Cases	Relief	No Relief	Percent- age Re lieved
(P) ribenzamine) Group 2	21	9	12	43
(Pyribenzamine and rag- weed desensitization) Group 3	47	35	12	74
(Ragweed desensitiza- tion)	18	10	8	55
Total	86	54	32	57

Cases were chosen at random and placed into various groups regardless of classification (A, B, or C) Discussion of each case is not feasible, but it is of interest to make some general comments on the cases represented in the various groups

In Group 1, where pyribenzamine alone was given, while the results were not outstanding, the administration of pyribenzamine gave symptomatic relief in 9 out of 21 cases. It was possible to determine results after the first or second dose of pyribenzamine. These patients reported relief within one hour or no relief at all. The taking of the drug before retiring and after breakfast was palliative in the cases getting relief. The stoppage of the drug at any time initiated the return of symptoms.

In Group 2, pyribenzamine plus ragweed desensi-

tization the top dose of ragweed according to the classification of each case was reached by mid-August and then reduced (seasonal reduction) to be maintained throughout the season Pyribenzamine was added at the onset of the season and administered twice daily In this group our best results were noted 35 of 47 obtained relief. In these 35 cases sneczing was diminished in various degrees of severity and in many cases was absent. However, in 10 of these cases there was no improvement in nasal or eye symptoms. In 3 cases, while the sneezing was improved the drug had no effect on the coseasonal asthma.

In the last group 3 (desensitization therapy, rag weed only) the pollen count in 1946 was not as high as compared with that of 1945 The highest count began to register around Labor Day reaching the maximum on September 10 1946 From that day the pollen picture improved steadily In our series in spite of a relatively low pollen count in 1946 only 10 cases obtained relief

Of 68 patients treated with pyribensamine 25 or 86 per cent, complained of side-effects case pyribenzamine had to be discontinued because of aggravation of dizzness. Whether or not the patient's hypertension had influenced the condition remains unanswered. In another case the drug had to be discontinued because of sleepiness, i.e., the patient fell asleep at the wheel while driving an automobile. The taking of pyribenzamine in addition to the phenobarbital the patient was receiving from the neurologic clinic, increased the sleepmess. In another case the drug had to be stopped because of marked palpitation nervousness, and weakness siness occurred in 10 cases. This effect gradually diminuhed or entirely disappeared, even though the use of pyribenzamine was continued on the same dosage schedule

Other ade-effects complained of were headache in 5 patients dryness of the mouth in 2 dizziness in 4 tinnitus in 2 nervousness in 4 nauses in 2. These effects were noted singly or appeared together with two or three other side-effects in the same patient However, they either diminished in intensity or disappeared entirely while pyribenzamine was still being administered.

Complete blood counts were taken in all patients receiving pyribensamine alone All counts were normal except in two. One revealed a white blood cell count of 4,050 with a differential of polymorphonuclears, 45 per cent, and small lymphocytes, 55 per cent. In another, white blood cell count was 8 050 neutrophils 42 per cent, small lymphocytes, 56 per cent, monocytes, 1 per cent, cosmophils 1 per cent

Summary and Conclusions

In a series of 86 cases of ragweed hay fever 21 were treated with pyribenzamine alone, 47 with desensitization and pyribenzamine, and 18 with maweed desensitization alone.

- Symptomatic relief occurred in 9 or 21 cases (43 per cent) in Group 1, receiving pyri benzamine alone, 35 of 47 cases (74 per cent) in Group 2, receiving pyribenzamine and ragweed desensitization and in 10 of 18 cases (55 per cent) in Group 3 receiving ragweed desensitiza tion alone
- The majority of patients obtaining relief from pyribenzamine, either alone or in conjunc tion with ragweed desensitization, required only two tablets a day Continuous administration of the drug was necessary to prevent the remission of symptoms.
- Side reactions occurred in 25 of the 68 patients or 36 per cent. These effects disappeared gradually while the drug was still being administered
- 5 Pyribenzamine did not affect the blood count
- In conclusion, pyribenzamine together with ragweed desensitization gave the best symptomatic rehef (35 out of 47 cases, or 74 per cent) Pyribenzamine alone produced relief in 9 out of 21 cases (43 per cont) Ragweed desensitization alone relieved 10 out of 18 cases (55 per cent)

THE NITROGEN MUSTARDS AND THEIR APPLICATION IN NEOPLASTIC DISEASES

D A KARNOFSKY, MD, New York City

(From the Memorial Hospital)

MUSTARD gas (bis-(β-chloroethyl) sulfide) was used extensively in World War I and chiefly because of its vesicant action a great many casualties resulted. Laboratory studies on animals, supplemented by clinical observations on men who had been contaminated with large amounts of mustard, proved that the agent also was capable of producing systemic intorication, characterized by the development of leukopenia, and by other evidence of injury to the bone marrow, as well as to the gastrointestinal tract

With the end of the war, the general toricity of mustard gas was largely forgotten in spite of the fact that chemists continued to make new derivatives of the compound. Occasional reports of the laboratory use of mustard in the treatment of experimental tumors, a procedure based on the local vesicant and necrotizing action of the chemical, were published, and in 1931 an isolated clinical study of the use of mustard gas in the local treatment of cancer was reported from Memorial Hospital by Adair and Bagg ¹

At the beginning of World War II, the warring powers developed an interest in a group of analogues of mustard gas, in which the sulfur (S-(C₂H₄Cl)₂) was replaced by nitrogen (R-N-(C₂H₂Cl)₂) These were given the categoric name of "introgen mustards" These compounds were potentially more versatile than mustard gas, in that a great variety of radicles (R in the above formula) could be attached to the nitrogen to alter the physical properties of the nitrogen mustard, without changing the structure of the bis-(\beta-chloroethyl) amine moiety A large number of nitrogen mustards were prepared, and it was shown that these compounds were very similar to mustard gas in their action The study of systemic effects of the mustard compounds, however, was intensified by the fact that the nitrogen mustards were more readily absorbed from the skin of experimental animals to produce fatal systemic intoxication. associated with lymphatic involution, leukopenia, aplasia of the bone marrow, and gastrointestinal injury

Considerable emphasis, therefore, was placed on the fundamental mechanism of the systemic actions of these compounds, and a summary review of these war studies by Gilman and Philips² has been published recently

The developing concept that the mustard compounds, acting systemically, were destructive to lymphatic and hematopoietic tissue possibly more fundamentally stated as a selective toxicity for rapidly growing cells—and that their toxicologic effects were in many respects similar to those produced by x-rays, suggested their use in the treatment of neoplastic disease Mustard gas was not considered for chinical use because it is volatile, quite insoluble, unstable in water, dangerous to handle, and difficult to ad-On the other hand, the nitrogen musminister tards form nonvolatile, stable, water-soluble hydrochlorides which can be handled with ease and safety, and these were selected for clinical Although many derivatives of the nitrogen mustards had been made, the tris-(\$\beta\$-chloroethyl) amine-hydrochloride and the methyl-bis-(8-chloroethyl) amine-hydrochloride were used therapeutically, since most of the essential laboratory data on these derivatives were at hand because of their importance as chemical warfare agents

In 1943 Gilman et al ³ at Yale University first reported, in a confidential military communication, the use of tris-(β-chloroethyl) amine in the treatment of 6 cases of terminal neoplastic disease. Subsequently, Jacobson et al ⁴ at the University of Chicago, Goodman et al ⁵ at the University of Utah, and Karnofsky et al ⁶ at Memorial Hospital, New York, assessed the therapeutic value of the methyl-bis- and tris-(β-chloroethyl) amines on a total of 160 patients. In a recent issue of the Journal of the American Medical Association, Rhoads, ⁴ chairman of the Committee on Growth of the National Research Council, has summarized the results obtained by these groups

It was stated in the summary that bis- and tris-(β-chloroethyl) amines had been used chiefly in the treatment of Hodgkin's disease, lymphosarcoma, and leukemia, but that occasional patients with other types of cancer, also, had been treated. The report emphasizes that these particular nitrogen mustards have not produced a cure for any of the types of cancer treated in this study. These compounds are injurious to many types of tissue, and appear to exert their greatest effects on rapidly growing tissue, either normal or neoplastic. Regressions of striking proportions in Hodgkin's disease, lympho-

sarcoma, and leukemia and gratifying palliative effects have been obtained in some cases, but these results are temporary, rarely enduring beyond several months. The use of these agents is attended by some degree of transient nausea and vomiting Caution and descrimination in their use is recommended because it has been shown that injury to the hematopoietic tissues consistently results, sometimes to a severe degree

The results of the clinical studies reported indicate that x-ray therapy has the advantage over the nitrogen mustards studied in that it can be applied locally. In the treatment of lymphosarcoma, Brill-Symmer's disease, lymphatic, and myclogenous leukemia the nitrogen mustards appear to offer no advantage over x ray treatment. In the treatment of Hodgkin's disease x rays are recommended in the early localized stages of the disease and in the local extensions of the disease beyond the lymph nodes When the disease is generalized and is attended by severe systemic into deation with fever anorexia and weakness the nitrogen mustards have sometimes induced very gratifying remissions which may last as long as three months and treatment may be repeated as long and as often as the hematologic status permits. Limited trials in melanosarcoma, metastatic mammary carcinoma, multiple myeloma, and sympathicoblastoma have not been encouraging Temporary symptomatic remissions have been produced in 4 pa tlents with anaplastic carcinoma of the lung. and satisfactory responses have been obtained in

polycythemia rubra vera. It is clear, therefore, that the nitrogen mustards thus far studied are not recommended as a substitute for standard methods of radiation therapy. Further clinical trials may show that these compounds will have a limited but definite role in the treatment of peoplestic disease

The nitrogen mustards are compounds of extraordinary theoretic interest, in that their chemical structure can be altered readily, they have a selective toxic action on certain cell types and they simulate in many respects the biologic effects of x rays The discovery of the toxicologic effects of this chemical group has given great impetus to the search for chemotherapeutic agents against cancer With the effective cooperation of chemists laboratory workers, and clinicians further advance in the study of nitrogen mustards is anticipated.

HEADACHES RESULTING FROM TENSION RAPIDLY RELIEVED WITH SEDATIVE

Sodium amytal, a sodative, will relieve such symptoms as headache resulting from tension or anxiety within one to five minutes when injected into the veins, according to three New York doctors writing in the current issue of the Archives of Neurology and Psychiatry published by the American Medical Association.

The authors—Capt. Samuel Susselman and Capt. Fred Feldman, Medical Corps, Army of the United States, and S Eugene Barrera, M.D Albany, NA — state that when symptoms are persistent and no organic cause can be discovered, the patient should receive an injection of sodium amytal.

They claim the the code was a second to be seen as a second to be second to be seen as a second to be seen as a second to be seen a

They claim that this sedative is of diagnostic value because it is a quick method of separating symptoms of organic disease from tension symptoms.

In more than 80 patients treated over a period of nine months, the hospitalization period was shortened for many because of the use of this sedative,

"The patient in whom the test is clearly successful will have no residuum of distress but will express, often spontaneously great relief and complete free-dom from pain and a feeling of well-being, accord ing to the physicians. They state that "this rapid litting of discomfort is especially impressive to both patient and physician in cases of longstanding headaches, which have remained unrelieved for months, or even years.'
The authors point out that not only will this seds-

tive relieve symptoms due solely to tension but it also will bring relief to patients with organic disease whose symptoms have been intensified by tension and anxiety

PENTOTHAL NITROUS-OXIDE OXYGEN ANESTHESIA

EDGAR H BACHRACH, MD, New York City

CHORTLY after pentothal sodium was introduced to clinical anesthesia it became apparent that its range of usefulness might be greatly widened by using it in combination with other anesthetic agents Spinal, regional, or inhalation anesthesia was given together with pentothal for a great variety of surgical procedures Organe and Broad¹ in 1938 reported a series of 236 cases in which pentothal was combined with 85 per cent nitrous oxide and 15 per cent ovygen Their results showed that these patients had a smoother anesthetic course with more rapid recovery than when pentothal alone was employed Tuohy² reported that the combination of pentothal with fifty-fifty nitrous oxide and oxygen resulted in a reduction in the amount of pentothal required

The value of oxygen given in conjunction with pentothal to prevent the hypoxia that may be associated with the respiratory depression caused by the latter drug is well established

It is the purpose of this report to present a series of 1,097 operations, some performed under pentothal alone and the others under pentothal nitrous-oxide oxygen anesthesia and to compare the results in the two groups. These operations were performed in a United States Army General Hospital in the European Theatre of Operations during the period from March, 1944, to June, 1945. All anesthesias were administered by the same group of anesthetists

Technic

The patients were premedicated one to onehalf hours preoperatively The dosage varied with the individual case but was usually 0 015 Gm of morphine sulfate and 0 0006 Gm of atropine sulfate A 25 per cent solution of pentothal was used in all cases. The patient was induced with pentothal and then the face mask was applied Nitrous ovide and ovygen in equal volumes were started, using a semiclosed system in a circle filter machine with the carbon dioxide absorber in the circuit Pentothal was given throughout the operation in amounts sufficient to maintain the patient satisfactorily anesthetized Toward the close of the operation only nitrous oxide and oxygen were employed

Results

An analysis of the cases (Table 1) reveals that the great majority of the operations involved the skin and subcutaneous tissues. Seventy-eight per cent (852 cases) were performed using nitrous

TABLE 1 -Types of Operations Performed

Type of Operation	Number of Cases

oxide and oxygen with pentothal, and 22 per cent (245 cases) under pentothal alone (Table 2)

TABLE 2-TIME REQUIRED FOR OPERATIVE PROCEDURES

	Pentothal and N ₂ O O ₂	Pentothal Alone
Operations requiring less than 30 minutes Operations requiring 30 to 60 minutes Operations requiring more than 60	478 cases 329	151 cases 80
minutes	45	14
Total	852	245

More than one half of the operations were completed in less than thirty minutes and only 6 per cent required more than one hour (Table 2). The amount of pentothal necessary for satisfactory anesthesia varied greatly and could not be predetermined for any given patient. In the operations requiring less than thirty minutes, dosages of from 0.1 to 1.0 Gm were required both with and without the use of nitrous oxide. However, the average dose for patients receiving nitrous oxide was 0.450 Gm, while those who were carried on pentothal alone required 0.596 Gm (Table 3).

TABLE 3 — DOBAGES OF PINTOTHAL WITH AND WITHOUT NITHOUS O'CLOF AND O'CYGEN

	Pentothal and N2O-O2	Pentothal Alone
Operations requiring less than 30 minutes Smallest dose Largest dose Average dose	0 100 Gm 1 000 Gm 0 450 Gm	0 100 Gm 1 000 Gm 0 596 Gm
Operations requiring 30 to 60 minutes Smallest dose Largest dose Average dose	0 200 Gm 1 600 Gm 0 615 Gm	0 300 Gm 1 700 Gm. 0 811 Gm
Operations requiring more than 60 minutes Smallest dose Largest dose Average dose	0 400 Gm 1 800 Gm 0 900 Gm	1 000 Gm 2 000 Gm 1 540 Gm

By adding nitrous onde and oxygen it was possible to reduce the amount of pentothal by 24.5 per cent. In those surgical procedures lasting thirty to sixty minutes similar results were obtained Again the individual variations were great ranging from 0.2 to 16 Gm. for the patients receiving nitrous oxide and from 0.3 to 1.7 Gm for those who did not average for the former group was 0 615 Gm. and for the latter 0 811 Gm This represents a reduction in pentothal of 24.2 per cent in those cases where the two agents were used

In the group requiring ancethesia for more than one hour a reduction of 41 6 per cent in pentothal was noted when nitrous oxide and overgen were

added

The operations in this group performed under pentothal alone required an average of 1.54 Gm, while in those cases where nitrous oxide and oxygen were added an average of 0 90 Gm was necessary

In addition to the reduction in the quantity of pentothal required, other beneficial results were observed by the addition of nitrous oxide and

oxygen

There were some patients in whom the skin reflexes could not be obtunded completely even when pentothal was pushed to the point of These pa moderate respiratory depression tients would move each time the surgeon incised the skin, occasionally to a degree which interfered with the operation. In no instance did this occur when nitrous oxide and oxygen were habba

While no accurate record was kept of the time it took for the patients to react from anesthesia it is my impression that they regained consciousness much sooner if nitrous oxide and oxygen were given with the pentothal This was ex tremely important under the existing conditions since trained personnel was not always available to return the patients from the operating room to the wards and in no case was an unconscious patient permitted to leave the operating room without a competent attendant

There was less respiratory depression when nitrous oxide and oxygen were employed since the desage of pentothal was generally less in these cases. In addition by having the patient breathe 50 per cent oxygen during the entire procedure the possibility of a slight but prolonged hyporda was greatly reduced

Summary and Conclusions

A comparison of pentothal alone and in conjunction with nitrous oxide and overen is pre-The use of the combination resulted in a reduction of the amount of pentothal required although there was great variation in desage for individual cases. In addition, a more rapid recovery period, less danger of hypoxia from respiratory depression, and more satisfactory operating conditions for the surgeon were obtained

By using the combination of the two agents it is possible to use intravenous anesthesia for many operative procedures which because of their nature or duration previously were considered unsuitable for this type of anesthesia

RESTRICTED USE OF SALT URGED FOR CONGESTIVE HEART FAILURE

Three Boston physicians advocate the restriction of salt in the diet with a liberal intake of fluid for patients with congestive heart failure, especially those with coronary and hypertensive heart disease, according to an article in the January 4 issue of the Journal of the American Medical Association.

The physicians who are from the Massachusetts General Hospital, are Edwin O Wheeler Graduate Assistant in Medicine William C Bridges Common wealth Fund Rosearch Fellow 1945–46 and Paul D

White.

They point out that 'with a few notable exceptions, casual limitation of salt and fluid has been the custom throughout the country and generally more stress has been placed on the restriction of fluid than on that of salt

When the heart is unable to fulfill its function

adequately as a pump and supply sufficient circu-lation to all of the tissues of the body, such symp-toms as shortness of breath swelling of the legs and abdomen may result.

To prevent this accumulation of fluid which produces swelling in the tissues the physicians treated 50 patients with congestion due to heart diseases of all types during the last year and a half

Of the 35 patients who followed the sait restricted diet faithfully 13 did not show improvement, while 22 were better, of the latter group 10 showed great benefit

Twenty of the 35 patients had hypertensive (caused by high blood pressure) and/or coronary heart disease. Eighteen of these showed improvement, in nine of whom it was pronounced

COEXISTENCE OF MALFORMATIONS OF THE GENITAL AND URINARY TRACTS IN WOMEN*

W T POMMERENKE, M D, and JOHN A BENJAMIN, M D, Rochester, New York

(From the Departments of Obstetrics, Gynecology, and Surgery, Division of Urology, University of Rochester School of Medicine and Dentistry, and Strong Memorial Hospital)

HE coexistence of malformations of the geni-L tal and urmary tracts in women having no other apparent congenital defects is not uncom-While the authors make no pretense of priority concerning these observations, they, nevertheless, believe that certain clinical considerations relating to these phenomena deserve emphasis which has frequently escaped attention in otherwise ample accounts bearing on the care of patients having these anomalies Since excellent descriptions of the ontogenesis of the female genitourinary systems are available,1-4 these These systems are need not be reviewed here intimately associated in their development and in their final relationship These facts, along with the coexistence of diseases common to both systems, are often used as justification for combining female urology and gynecology as a single clinical specialty

It is known that certain structures in the development of the genitourinary systems have a transitory existence Other structures abandon their original design for function to pursue new ones, and in the course of such events it is small wonder that various malformations come into Many varieties of malformations may occur, depending upon the degree and position of agenesis and upon the stage of development at which the patterns become fixed This atavistic arrest, when once established, is not contingent upon adjacent structures which may or may not It is, however, almost axiomatic be affected that congenital defects, which often represent arrested development, do not occur singly

The müllerian ducts are formed by the canalization of cords of celomic epithelium resulting from the invagination of the surface of the uro-These ducts normally fuse with genital folds the formation of the uterine cavity, which becomes continuous with that of the vagina derived in part from the urogenital sinus Atypical fusion of the mullerian ducts is one of the commoner forms of congenital malformation encountered in the female genital tract Nonfusion of these ducts may occur at almost any place along the line with duplication of the uterus without a septum. or with a septum which may bisect the uterus and Furthermore, this nonfusion may be vagina

complete or incomplete at different levels of the gental tract. According to Gruenwald, experimental destruction of the caudal portion of the wolffian duct results not only in aplasia of the kidney on the treated side but also in aplasia of the müllerian duct equal in degree to the defect made in the wolffian duct. Abnormal development of the wolffian duct would, therefore, explain not only the agenesis of the mesonephros and metanephros, and other malformations of the kidney, but also defects in the müllerian tract as well 3-5

As is indicated in the appended case reports, duplication of the müllerian components below the point where fusion ordinarily occurs was the outstanding genital anomaly, while absence or displacement of a kidney and ureter characterized the urologic aberrations. Although the causative factors responsible for the abnormalities are not known, nevertheless, they can be interpreted by an understanding of the embryologic backgrounds of the genitourinary systems Since this type of genital abnormality, i.e., the improper fusion of the müllerian ducts, may not interfere with the menstrual, gestational, or parturitional functions, one can understand why the patient may be unaware of its existence and why it may escape notice of the attending physician save by careful examination. Discovery of the anomaly, in fact, may come by chance

Many experienced pelvic surgeons will attest to the innate risk of injury to the ureters that may attend a relatively simple hysterectomy This hazard is greatly increased if adjacent structures are malformed and displaced beneficent nature may condone the destruction of one ureter if its mate is undisturbed, only tragedy can follow the unwitting injury of a single ureter, unless correction is adequate and prompt Inflammatory and neoplastic diseases, common proclivities of the normal genital tract also beset the anomalous tract Inasmuch as the malformed genital tract is not uncommonly associated with anomaly of the kidney or ureter, extensive surgery of the genital tract should not be contemplated without knowledge of the anatomic and functional status of the genitourinary system Such surgery, moreover, should not be undertaken without special caution because of the added hazards involved when anomalies of the müllerian tract are recognized or suspected

^{*} Aided by a grant from the Dr Henry C Buswell Memorial.

According to records covering the interval between January 1, 1938 and April 1, 1946, 25 patients were admitted to the Gynecologic Serv ice at Strong Memorial Hospital and upon whom the diagnosis of various degrees of developmental anomalies of the uterus and/or vagina were ven The records of 14 of these cases make no reference to the urmary tracts as they might relate to congenital malformations. Five nations had varying degrees of agenesis of the genital tract but had normally formed and functioning kidneys as verified by instrumental and pyelographic studies Six patients had definite mal formations of the genital tract coexisting with major urologic anomalies. Case lustories of these 6 patients are briefly summarized as fol-

Case Histories

Case 1—E. M was a 47 year-old married nullipara, with a bicornate uterus which has been found on laparotomy twenty years earlier. A single vagina was present. The configuration of the uterus was that of bicornate variety. Intravenous pyelograms showed a functioning left kidney. There was no evidence of a kidney on the right side.

Case 2.—J F was a 25-year-old para I, with a uterus becomis unfcollis. Intravenous pyelograms showed a horseshoe kudney with blunting of the calyees. The patient has since passed a six month

fetus from the right side of the uterus.

Case S -E. L. aged 15 with utarus didelphus, double vagina, and with pyocolpos of blind left

vagina, had had an operation for the removal of the left horn of uterus, tube, ovary, and resection of left vagina. Intra enous pyelograms showed absence of the left kidney The patient was subsequently delivered of a full term child per vaginam

Case 4.—S. B was 5 years old A retrograde pyelogram showed right hydronephrosis with absence of the left kidney Adhesive bands and aber rant vessels caused kinking of the right ureter These were surgically removed. She had a uterus

bicornus septus

Case δ-8 H a 57 year-old nullipara, with uterus bicornis subseptus, had a panhysterectomy done because of adrenocarcinoma in the right horn rays showed a right kidney only No ureteral orifice was found on cystoscopy on the left side

Case 6—M T was a 21 year-old woman with congenital absence of vagina. On rectal examination no uterus nor ovaries were felt. Secondary sex characteristics were well developed Intravenous pyclograms showed no kidney shadow in the left side. The right kidney was normally outlined. On cystoscopic examination only the right ureteral orr-fice was found.

MEDICAL RESERVE OFFICER NEEDED IN NEW YORK CITY

The Naval Air Reserve Training Command, with headquarters at Naval Air Station, Gleuview, Illinois has seventeen nationally located Naval air stations at which Naval Reserve Medical Officers may serve on active duty with full pay and allowances and with the privilege of returning to

civilian life at any time on request. There is now a vacancy at the Naval Air Station, New York, N Y

Additional details may be obtained from Chief of Naval Air Reserve Training Naval Air Station, Glenview Illinois.

THE RESEARCH COUNCIL ON PROBLEMS OF ALCOHOL

In an effort to determine the causes of chronic alcoholism, the Rosseroh Council on Problems of Alcohol presented on January 15, to Cornell University Medical College the first of five annual \$30 000 checks to finance a five-year \$150,000 research project at the New York Hospital-Cornell Medical Center

The study was announced jointly by Dr Lyman C Duryea, medical director of the Research Council, and Dr Joseph C Hinsey dean of Cornell University Medical College.

"At this stage, and for some time to come the project will be focused on the study of the causes of alcoholism rather than on how to treat it, the announcement said, 'and for that reason the patient group under study will probably not be large

The research will be under the direction of Dr Oakar Diethelm, professor of pechiatry at Cornell and psychlatrist-in-chief of the New York Hospital.

Patients will be hospitalized in special quarters in the New York Hospital, and the research work will be done there and in Cornell by members of the staffs of the two affiliated institutions.

AMPHETAMINE SULFATE (BENZEDRINE) IN THE TREATMENT OF OBESITY

A Critical Estimate

HENRY B RICHARDSON, MD, New York City

(From the New York Hospital and the Department of Medicine, Cornell University Medical College, New York)

HE treatment of obesity by means of amphetamine sulfate (benzednine aroused much interest in the years following 1937 when Nathanson1 demonstrated its effect in reducing the weight of narcoleptic patients Amphetamine, as is well known, has characteristics which differentiate it from the other sympathomimetic drugs The special effects which make it useful in obesity are its stimulation of the cerebrum and its depressing effect on the appetite, as shown by Lesses and Myerson? Recently, Hawirko and Sprague, have published further observations under the title "Treatment of Obesity by Appetite-Depressing Drugs" They used the dextrorotatory isomer instead of the racemic drug. These authors base their work on the supposition that the former is the main appetite-depressing factor and that the levo-portion is the main excitatory factor view of the literature reveals little evidence to support this statement as will be noted below

Hawirko and Sprague report their treatment of obesity, in which they combined d-amphetamine with other measures a low-calory diet, vitamins, and sometimes thyroid extract, or diuretics Their patients were ambulant, and were "of the exogenous type commonly encountered in clinical practice" In an unselected series of 162 patients, 90 discontinued treatment within two months, although they had been doing well The remaining 72, or 44 per cent, who continued with the treatment lost weight in varying degrees. the loss ranging from 10 to 114 pounds average loss of weight expressed in pounds was greatest in the heaviest cases The percentages shown in the authors' table indicate, however, that all of the patients who weighed less than 200 pounds at the start lost 30 per cent or more of their excess weight, whereas among those who weighed over 200 pounds, 13 of the 30 failed to lose as great a percentage Thus, the results were less satisfactory in the more severe cases

From the point of view of treatment, the authors' approach is sound, since they recognize the fact that loss of weight can take place only with a negative caloric balance. They concentrate on the intake of food, which they attempt to influence by two methods by diet and by depression of the appetite by means of d-am-

phetamine In the table, their patients are ranged in the order of their weight, and the loss of weight is recorded in terms of the percentage of the excess over normal. This is a good example to follow, since it permits easy evaluation of the results.

Other information which would be of interest is lacking In spite of the title, the authors do not record the actual effect on the appetite of individual patients, or correlate the depression of the appetite with the loss of weight In this omission they follow the example of many other workers on the subject. The literature on obesity shows a striking lack of curiosity as to the pharmacologic effect of the drug which is being used authors give no data to show whether the loss of weight was the result of decreased appetite or of increased caloric expenditure. This might require a metabolism ward, using perhaps the measurement of the insensible perspiration as developed by Johnston and Newburgh & Even without such equipment, the statements of the patients as to their appetite would be of great Furthermore, the authors give no data with which to compare results with and without the drug, or to judge the difference between the dextrorotatory isomer and the racemic mixture

Their evidence as to the value of d-amphetamine rests, therefore, on the unexpressed assumption that their results compare favorably with previous observations in which the racemic Although the results are undrug was used doubtedly good, they fall into much the same pattern as previous observations Characteristic of all the series is the large number of patients who abandon treatment Such patients are rarely included in the reports, but might yield information of great value if followed up Characteristic also is the fact that very few of the heavier patients were able to reduce to anything This goal of approaching their normal weight treatment was reached by the authors in only one of the patients whose initial weight was over 200 pounds, she lost 65 per cent of her excess weight The results would have to be decisively superior to previous observations in order to prove anything about the effect of d-amphetamine, whereas actually they are in very much the same category as the preceding reports

The theoretic basis of the paper the statement that the appetite-depressing action of the drug is concentrated in the dextroisomer and that the excitatory action is concentrated in the levomomer, has little or no support in the literature. The authors cite Colton and his associates who made the same statement, but again without presenting their experimental data authors took the drug experimentally themselves, 40 mg and 110 mg respectively, for forty-eight and seventy two hours, with complete abstinence from water, food, and sleep although continuing their normal activities Efficiency and comfort were not disturbed for the first forty-eight hours, but a number of toxic manifestations developed in the second subject on the third day. Thus, the drug has a remarkably exhilarating effect despite the absence of food, water, and sleep In the majority of their cases, adequate appetite control and increased drive were observed Thus, the latter portion of the authors' paper contradicts the opening statement.

Their assertion is also contrary to animal experimentation. for instance, the work of Schulte, Reif et al , who demonstrated that the optimum central stimulation resided in the dextroisomer of amphetamine In humans also the dextromomer is more active in its cerebral excitatory effects than the levoisomer For example, Rosenberg' states that 'the chief advantage of the dextrorotatory isomer over the racemic form lies in its greater central activity without increase of untoward manifestations The drug is valuable in obesity because of its favorable effect on mood and excessive appetite and Prinzmetal and Alles' have shown that the dextroisomer is three to four times as active in its central stimulating effects as the levoisomer Much the same can be said of the unpleasant excitatory effects Davidoff¹⁸ states in his conclusions that untoward effects and emotional irritability occur more often with dextro-amphetamine than after the administration of the racemic drug. It is clear then that the dextroisomer is not free of undesirable excitatory effect It is misleading therefore, to state that the appetite-depressing action is free from excitatory effects, beneficial or otherwise Such a statement might lead the physician into a false sense of security

As to the pressor effects, all observers agree that these are equally strong in the dextro- and levoisomers. Concerning the depression of the appetite no statement can be made, because comparative data are lacking

The only known advantage, therefore, of the dextroisomer is that it produces a given excitatory effect with less pressor or sympathomimetic action than the other isomers. Suppose a cer

tain amount of excitation is produced, for example, just enough to prevent sleep, if this is accomplished by means of 10 mg of the dextroisomer, then approximately 16 mg of the racemic form would be required to produce the same of fect, and 40 mg of the levoisomer On the other hand, the pressor effects of the three momens are proportionate to the above doses the dextroisomer instead of the racemic form thus provides a factor of safety against pressor or sympathomimetre effects in the ratio of about 10 to 16 Differences of this magnitude are of little significance in clinical medicine. As indicated above, the use of the dextroisomer is no safeguard whatever against overexcitation, which under certain conditions can be the most dan gerous of all the torue manifestations

The question therefore, reverts to the state in which it existed prior to the use of the dextrosomer. The pharmacologic actions of amphetamine sulfate have been the subject of excellent reviews, among which are those of Myerson¹¹ and Gold.¹² Its beneficial effects in narcolepsy and in post encephalitic parkinsonism are well-established. The distress of patients with these diseases makes its use almost obligatory.

The situation is different in obesity, which is not a disease in the same sense as those men tioned Most obese patients are able to carry on with comparatively little physical disability or discomfort Although their life expectancy is shortened, they do not constitute a medical emergency nor do they undergo much suffering of a physical nature Many, if not most of them are subject to neurotic symptoms and a great deal of unhappiness, but it is questionable whether these symptoms can be removed by the mere reduction of weight. Most papers on obesity advocate the use of amphetamine sulfate only as an adjuvant, and not as the primary treatment. The indications therefore are not nearly as compelling as in narcolepsy or posten cephalitis.

Within these limitations the drug has been found useful by the majority of authors who have published observations on obesity. Some of the evidence is much more convineing than that presented by Hawirko and Sprague. Rosenthal and Solomon¹³ used the drug after a preliminary treatment of four weeks with diet alone. In the second four weeks with amphetamine, the weekly loss of weight was 0.81 against 0.11 in the pre-liminary period. They gave and withheld the drug in alternate periods and published curves to show that the drop in weight corresponded to the use of the amphetamine. One patient who received the drug lost weight without restriction of diet. Thus, the effect of the drug appeared

definite, although the loss of weight was not substantial. In reviewing the action of amphetamine, Gold¹² discusses the effect of the drug on the appetite, and in particular its effect in relieving the obese patient from states of tension and depression. He concludes that it is eminently suited to this purpose. The work of Bruch and Waters¹⁴ on obese children suggests, however, that the factor of suggestion is extremely hard to evaluate. They found great difficulty in deciding to what extent the reduction of weight was due to suggestion and to what extent it could be attributed to the pharmacologic effects of the drug

Since obesity is a relatively benign condition from the physical point of view, the toxic actions of amphetamine should be scrutinized may be classified as physical or psychic are relevant to the treatment of obesity, although they have been reported mainly in people who According to Myerson, 11 the most were not fat common disagreeable or dangerous reactions are a sense of fullness in the head, severe headache, giddiness, excitement, a dry-feeling in the mouth, and queer sensations in the abdomen Similar symptoms are reported by other observers, for example, Davidoff and Reifenstein 15 Severe effects on the circulation have been reported in rare instances Davies 16 cites 4 cases of collapse, including his own report He observed an anemia of 40 per cent hemoglobin associated with cardiovascular collapse in a normal individual who administered to himself a total of 190 mg of amphetamine sulfate in nineteen days Recovery was gradual but complete Apfelberg17 reported severe cardiovascular collapse with coma, convulsions, and spasticity with involvement of the pyramidal tract occurred in a man who took 140 mg in one dose, possibly with suicidal intent Davies16 regards a dose of 20 mg as excessive for normal subjects because of insomnia and other unpleasant after-In his review Gold¹² states that the effect differs in different persons, and that the dosage varies from time to time in the same Peters and Faulkner¹⁸ state that racemic amphetamine given as an inhalant appeared to precipitate angina pectoris in one of They warn against the use of the their 28 cases drug in this disease Davidoff and Reifenstein¹⁵ believe that the drug should not be used in most cases of cardiac and vascular disease

The central action of amphetamine, like the peripheral effects, leaves only a narrow margin of safety. In 10 normal individuals who received 10 to 30 mg daily, Davidoff and Reifenstein found that 7 had elevation of mood, 5 showed "a state of increased irritation," several a disappearance of previous fatigue, and 2 had

lassitude when the drug was discontinued The patients also had a variety of untoward effects, including insomnia, malaise and fatigue, dullness and forgetfulness, confusion and inability to concentrate, and aggressive behavior. Some of the normal subjects behaved in a manner which might be described as hypomanic. Increased over-all efficiency as a result of the drug is reported, but this seems to be due to increased energy rather than to any marked increase in mental efficiency. The effect of the drug is to increase the ease with which mental associations can be made, an effect which is good or bad according to the makeup of the individual.

Davidoff and Reifenstein¹⁶ describe their results with amphetamine in major mental ill-Among 10 depressed psychoneurotic patients not one showed improvement in all Three showed elevation of mood, 6 increased talkativeness, and 4 accelerated motor Only 2 patients showed improvement activity The underlying psychoin general efficiency neurotic tendency remained unchanged patient had a severe physical reaction, became overtalkative, and appeared delirious on the fifth day Elevation of mood was the least frequent occurrence In general they found the drug to be more stimulating to normal persons than to those with mental illness

In another group of psychoneurotic patients characterized by lack of energy, drowsiness, weakness, and easy fatigue, Solomon et al ²¹ observed only 2 out of a total of 22 patients who showed definite subjective improvement. According to Myerson, ¹¹ the effect cannot be predicted but can be readily determined by clinical trial. Goodman and Gilman²² state in their text that the effect of the drug in psychogenic disorders is controversial.

Patients with latent or overt psychotic trends may be thrown completely off balance by amphet-Young and Scoville23 observed amine sulfate a paranoid psychosis in 3 narcoleptic patients, 2 of these developed paranoid symptoms shortly after the administration of amphetamine Solomon et al 21 observed another such patient who developed paranoid ideas Two of their patients with involution melancholy became agitated and One of the schizophrenic had to be committed patients of Davidoff and Reifenstein 15 made a homicidal attack on his wife, and a manic-depressive patient attempted suicide Guttman20 cites another patient in the literature, probably a schizophrenic, who committed suicide by jumping out a window

The drug is, therefore, of questionable value in the neuroses and is contraindicated in cases where there is any suspicion of an underlying psychotic trend Such patients are far more numerous than is generally realized. These trends should be suspected in patients who are depressed, shy, secretive, suspicious peculiar in appearance or behavior, or excessively hypochon duscal

The psychologic effects of amphetamine are important in the treatment of obesity for two reasons first, because there is nothing to prevent the person with a psychotic personality from becoming obese, although this perhaps does not happen very often second, because the obese person very frequently suffers from neurotic symptoms.

The frequency of such symptoms in the obese person is evident in passing comments which have been made by various investigators among them Newburgh and Johnston.24 The preponderance of patients who fail to carry out a reducing reg men demands some degree of scientific ourlosity as to the reason for their behavior Hawirko and Sprague' express a well founded interest in the majority of their patients who failed to carry out the treatment, and propose further investigation of them. Lesses and Myerson's state that the cause of obesity may be a defect in the appetite mechanism, governed by physical status, social habits, and psychologic influences, increased eating, which does not represent true hunger takes place in order to offset and compensate for the disturbed mood They refer to the "anhedonia' common in obese patients. This may be paraphrased as the loss of the savor of life and is a common observation in many neuroses Rosenberg' comments that the rational use of amphetamine is to enable patients to adhere to a reducing diet Through its favorable effect on the mood as well as through its direct action on the appetite he finds that it overcomes both the depression and the craving for food which are so typical of obstinate cases of obesity Gold12 discusses the treatment of obesity by means of amphetamine under the heading of psychiatry and emphasizes its favorable effect on mood and well Instances of such observations could be multiplied, but they are usually made in passing Little systematic study has been made in obesity of psychotherapy or of the psychologic effect of drugs. The question has received attention, how ever from a few psychiatrasts 21-22. In a forth coming paper39 I have expressed the point of view that exogenous obesity is frequently a manifesta tion of a neurosis. A detailed psychiatric study to of one of my patients indicates that this disturbance may be very profound and may take its origin early in life.

The point of view that obesity is an integral part of a neurotic development, if generally accepted, will supply an ottologic basis for treatment which has been conspicuous by its absence. The sciences of metabolism and endocrinology have yielded little information of value for the treatment of obesity. In the course of an admir able review of the extensive literature on this subject, Rony¹¹ states that there is no uncontested evidence of any specific defect in the intermediary metabolism of fat that could be regarded as a major cause of obesity. The frequency with which clinicians have been driven to the use of amphetamine is an indication of the ineffectiveness of the glandular preparations which are now available.

In obesity, as in other conditions, the rationale of treatment depends on the etiology In so far as this is psychogenic the treatment should be directed against the underlying neurosis agement of the obesity should then be regarded as incidental to this aim. The physician cannot safely assume that reduction of weight is beneficial unless it is accompanied by an improvement in the neurosis To illustrate a patient under my care thought that she would solve all of her personal problems if she could get rid of her fat She then lost 53 pounds with medical therapy and a superficial discussion of her problems this loss of weight she was no more contented than before. Gradually thereafter she regained all but 20 of her initial 216 pounds. This occurred during a course of intensive psychotherapy by means of which she worked through many of her difficulties She ended her treatment heavier but happier than she had been at her lowest weight. Bruch implies that interference with the eating habits of obese children may be harmful in cases where the neurotic satisfactions of eating are the patient a only resource.

The use of amphetamine sulfate to influence the caloric balance is subject to the above considerations. In its psychologic effects it is aimed more directly against the neurosis, but here again it has no fundamental effect on the underlying neurotic pattern.

More knowledge is needed concerning the psychogenic factors in obesity. The influence of these factors on treatment should also be explored along the lines of the paper by Bruch and Waters. "Among them is the effect of medication as psychotherapy whether as a by product of its pharmacologic action or independent of this. Other aspects of the doctor-patient relationship as applied to the treatment of obesity should be explored.

Psychotherapy should be made the object of deliberate and careful observation. Under this term I would include the whole range of such treatment, from simple medical therapy to intensive psychiatric treatment. Until these citologic factors and their management are thoroughly understood, the rationale of therapy

with amphetamine sulfate will not be fully established

Summary

The claim that the effect of amphetamine sulfate on the appetite can be isolated from other effects of the drug appears to have little or no support in the literature On the contrary, the depression of the appetite is regularly associated with excitation of the cerebrum The dextroisomer provides a small margin of safety, but only against the pressor and sympathomimetic This margin is small in comeffects of the drug parison with the racemic drug, in the approximate ratio of 10 to 16 Severe toxic effects, cardiovascular or cerebral, have been reported in a variety of conditions, including normal individuals and patients with neuroses or other mental illnesses Some of these reactions have occurred without excessive doses The drug has been advocated in the treatment of obesity as an adjuvant to other methods, the chief of which is the low-calory diet It often has a favorable effect on the caloric balance, through decrease in the appetite, increase of physical activity, or both With or without the drug, a large proportion of patients in every series abandon the treatment, in some instances even when they are losing Various authors have drawn attention to the psychogenic factors, and the opinion has been stated that obesity is the physical expression of a neurotic development. From this point of view the use of amphetamine sulfate is rational because it is directed against the neurotic symptoms It has no permanent effect, however, on the underlying neurosis More knowledge is needed concerning this aspect of obesity in rela-

Only when this knowledge tion to treatment is forthcoming will the use of amphetamine sulfate be on a completely rational basis

POSTGRADUATE INSTRUCTION TO BE GIVEN AT TIOGA COUNTY

1946

"The Treatment of Angina Pectoris and Coronary Occlusion" is the subject of the postgraduate lecture which will be given May 15 to members of the Troga County Medical Society at the Iron Kettle Inn, Waverly, at 800 pm Dr Edward C Reifenstein, professor emeritus of medicine, Syracuse University, College of Medicine, will be the This instruction is provided by the Medilecturer cal Society of the State of New York with the cooperation of the State Department of Health

BENZEDRINE SULFATE IN ELDERLY PEOPLE

WILLIAM CAVENESS, M D, New York City

(From the Division of Neuropsychiatry Montafiore Hospital)

THE administration of bensedrine sulfate* has been reported to be of value in the treatment of narceless, 1.2 Parkinsonism, * * obesity * * and mild depressive states * * The toxic effects of single doses and of long-continued administration have been the subject of numerous reports * * * Old age, with the attending changes in the cardiovascular system has been considered to be a contraindication to the use of this drug although there have been no reports in the literature regarding its use in such patients. For this reason a study of the effect of this drug on elderly patients was conducted at the Montefiore Hospital.

Twenty-six patients over 50 years of age, were selected from the neurologic wards without regard to their neurologic diagnoses. The average age of the patients in this group was 65 years. Eight patients were in the sixth decade, 16 patients in the seventh decade, and 2 in the eighth decade of these patients died within a few weeks of the onset of this study and were excluded from this report. The death of these patients was in no way related to the small amount of benzedrine sulfate which they were taking Two of them were suffering from amy otrophic lateral aclerosus and died of pulmonary embolism and bronchopneumonia respectively The third patient had a transverse myelitis with decubitus ulcers, and died of complications follow ing suprapubic cystotomy

Procedure—The drug was administered for four teen consecutive weeks in the following dosage gradient 5 mg, daily for one week, 10 mg, daily for one week, 20 mg, daily for one week 20 mg, daily for one week 25 mg daily for four weeks and 30 mg, daily for six weeks. Base and concomitant observations were made on blood pressure, pulse electrocardiogram, blood urea nitrogem, unne al bumin and specific gravity, red blood cells, hemoglobin, white blood cells, respiration, temperature, weight, appetite mood activity and adjustment to ward.

Results —The physiologic findings in the basic and final weeks are indicated in Table 1

Weight—In 15 patients the weight at the end of the experiment was within three pounds of their weight at the start of the experiment. In 2 patients there was a gain in weight of six and eight pounds, respectively. In 5 patients there was a lose of weight varying from four to eight pounds. One patient with syringomyells suffered a fracture of the thigh, became depressed, ate poorly, and lost thir teen pounds.

Benzedrine sulfate used in this study was furnished through the courtesy of Smith, Kilne & French Laboratories.

Blood Pressure—There was no evidence of any consistent change in the blood pressure throughout the course of the experiment. The systolic pressures at the end of the experiment were within 10 mm of the control pressure in all but 10 patients. It was lower by more than 10 mm in 4 patients and higher by more than 10 mm. in 6 patients.

The control systolic pressure was between 95 and 110 mm. in 4 patients In all 4 patients the systolic pressure at the end of the test was raised 10 mm. or more, with an average rise of 21 mm. The systolic pressure at the end of the experiment was between 118 and 132 mm. in the 4 cases

The systolic pressure was between 118 and 150 mm. in 14 patients at the start of the experiment. The final reading was within these same limits in 10 of the 14 patients. In 3 patients there was a fall to below 115 mm. In 2 patients there was a rise to over 150 mm. in 1 case from 140 to 160 mm and in a second case from 130 to 162 mm.

The control systolic pressure was greater than 150 mm. in 5 cases In 3 of these cases the systolic pressure was within 10 mm. of the control pressure in one it was 15 mm. lower, and in the other case it was 50 mm. higher

The diastolic pressure at the end of the experiment was within 10 mm. of the control pressure in all but 10 patients. It was decreased by 21 mm. and 11 mm. respectively in 2 cases and increased by 13 to 48 mm, in 8 cases. The pressure was raised to 80 mm. from an initial level of 40 mm. in one case to 78 mm. from 30 mm in a second case to 85 mm. from 65 mm. in a third case and to 78 mm. from 65 mm. in a third case. The increases in the other 0 patients were all within the range of normal except for 2 patients. In one case the change was from 90 mm. to 110 mm. and in the other it was from 85 mm to 100 mm.

Pulse.—There was no agnificant change in the pulse rate in any of the 23 cases

Electrocardiogram.—There was no significant change in the electrocardiographic readings in any of the 23 cases.

Blood Urea Nutrogen —Twenty two cases showed a change in blood area nutrogen. Of these 8 showed an merease, the highest increase being 6.5 mg. per cent, the lowest 0.2 mg. per cent, with an average increase of 3.4 mg. per cent. Fourteen showed a decrease, the highest decrease being 8.0 mg. per cent, the lowest 19 mg per cent, with an average decrease of 3.4 mg per cent

Urine Albumin.—In the 23 cases only 2 showed any albumin. In the control period both of these showed 1+ in the final week, 0

Urine Specific Gravity —In none of the 23 patients was there a change beyond normal limits.

Red Blood Cell Count -The total red blood cell count varied between 3 3 million and 50 million at the start of the experiment, and between 3 7 million and 57 million at the conclusion of the experiment (over 50 in only one patient) In 12 patients there was no significant difference between the initial and final counts In 2 patients there was a slight reduction (from 4 5 to 3 85 in one patient, and from 4 6 to 4 3 in the second patient) In 9 patients there was an increase in the total varying from 0.3 million to 20 million The greatest increase was in the patients with a low count at the start of the experiment Eight patients had less than 40 million at the start of the experiment, and in 7 of these 8, there was an increase varying from 03 million to 20 million by the end of the experiment, as shown in the following table

TABLE 2

<u> </u>		

(Cases numbered 2, 4, and 5 in Table 2 received ferrous sulfate, 0 4 Gm three times daily, during the experiment)

Among those showing an increase, 4 received ferrous sulfate and one, liver extract. These 5 showed an average increase of 190,000. Among those showing a decrease, one received both ferrous sulfate and liver extract, with a decrease of 80,000.

Hemoglobin —Changes in hemoglobin paralleled changes in red blood count with three insignificant exceptions (1) reduction by 80,000 in red blood count and gain of 1 5 Gm in hemoglobin, (2) reduction by 100,000 in red blood count and gain of 3 Gm in hemoglobin, (3) reduction by 230,000 in red blood count and no gain or loss in hemoglobin

White blood cell count None of the cases showed leukopenia In 4 of the cases there was a minor leukocytosis, and in 2 a moderate leukocytosis coincident with local infections

Respiration and Temperature —There was no significant change in respiration or temperature in any of the 23 cases

Mood—The patients in this study had been on the wards of the hospital for periods varying from several weeks to many months before the study was started They were well adjusted to the life in the hospital and did not present any significant deviation from the normal in regard to their mood During the course of treatment with bensedrine sulfate, there was no demonstrable change in their squastment to the hospital routine, or in their mood, with the exception of one patient who became depressed following a fracture of the thigh

Conclusion

In elderly subjects receiving benzedrine in dosages up to 30 mg daily, for a period of over three months, no significant changes were noted in the cardiovascular, urinary, hematopoietic, or respiratory systems, temperature, weight, or affec tive state. From this no deleterious drug-effect is indicated

ROWLAND BURNSTAN APPOINTED EXECUTIVE DIRECTOR OF STATE CHARITIES AID ASSOCIATION

Rowland Burnstan economist, educator and ex ecutive, has been elected executive director of the State Charities Aid Association by the Board of Managers to succeed Homer Folks, who has retired.

Mr Burnstan who was born in Scranton, Pennsylvania, November 9 1901 is a graduate of Lafayette College, with degrees of B.S and A.M. He obtained a degree of Ph.D from Columbia University in 1929 and Sc.D from the University of Chicago in 1938.

From 1932 to 1937 he practiced as a consulting management engineer in Chicago and New York. During this period he was a professor of economics at Carleton College in 1937 and in 1941 resigned to assume the post of Director of the Aeronautical Division of the Minneapolis-Honeywell Company He has been President of the Lawrance Aeronautical Corporation since 1948.

He served as a member of the Advisory Committee of the Minnesota Institute of Governmental Research and on the Minnesota State Planning Board. He represented New York State at the National Tax Association in 1929

Mr Burnstan was a member of the League of Nations Committee to Study the Organization of Peace. Columbia University in 1929 awarded him a traveling fellowship for research in Western Europe.

He is the author of books on taxation and other Ho is the author of books on taxation and other economic subjects published in English and German, and articles on aeronautics. He is a Fellow of the Royal Economic Society the American Economic Association the Academy of Political Science A.A.A.S. Associate Fellow Institute of Aeronautical Sciences National Aeronautical Association, American Management Association, Associ sociate Fellow of the Royal Aeronautical Society (England)

He is a member of Phi Gamma Delta fraternity and the University Clubs of New York and Wash

ington, D C

ARREST TUMOR OF BONE MARROW

Two new English drugs, used in a New York hospital have proved effective in checking multiple myeloma, a malignant tumor of the bone marrow

No effective form of therapy was known for this highly fatal disease until these drugs—Stilbamidine and Pentamidme—demonstrated their tumor con-

trolling and pain relieving properties.

Writing in the January 18 issue of the Journal of the American Medical Association Isidore Snapper M.D., from the Second Medical Service of the Mount Sinai Hospital, New York, reviews the treatment of 15 patients

He states that 'all these patients were suffering excruciating pains when the treatment was begun,

Thirteen were immobilized in bed All 15 improved considerably as far as the pain itself was concerned. Eleven could walk at the time of discharge from the hospital.

Dr Snapper points out the the 'treatment merely checks the disease and does not cure it.

This disease, usually associated with anemia, causes neuralgic pains. Later painful swellings appear on the ribs and skull and spontaneous fractures may occur

Injections into the veins of Stillbamidine proved successful in the majority of patients. However, in two who were not helped by Stilbamidine, Pentamidine was effective.

CONFERENCES ON THERAPY

DEPARTMENTS OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDICAL COLLEGE AND THE NEW YORK HOSPITAL

THESE are stenographic reports of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. A selected group of these conferences is published in an annual volume, Cornell Conferences on Therapy, by the Macmillan Company. The next report will appear in the July 1 issue.

Treatment of Hepatic Insufficiency

DR PAUL A BUNN The conference on the treatment of hepatic insufficiency will be opened by Dr Damel H Labby of the Rockefeller Institute Work on this problem, now in progress at the Institute, has borne results in the form of important therapeutic measures as well as of advances in understanding of the complex physiology of the liver

DR DANIEL H LABBY Knowledge in the field of liver physiology has been won laboriously, because liver functions are not only multiple, but are often performed in cooperation with other organ systems also ill-understood rational therapy must be directed at the physiclogic mechanisms involved, progress in the therapy of liver disease has awaited advances in many fields Because of the progress in biochemistry, nutrition, and metabolism, and the large experience in clinical liver disease during World War II, great strides are being made in establishing the therapy of liver disease on a more secure basis than that of the past We have time today to consider the problems arising from two forms of hepatic insufficiency, acute infectious hepatitis and cirrhosis The first is an example of aberrant liver function resulting from a relatively rapid and diffuse insult to the liver a severe degree of hepatic insufficiency may develop quickly The second, cirrhosis, is an example of insidious, progressive insult to the liver, the clinical manifestations of which may not appear until late in the disease

Acute hepatitis has been considered to be a self-limited disease. In over 375 cases studied at the Rockefeller Institute Hospital there have been no deaths, although the general mortality of the disease is expressed as approximately 0 3 per cent. Therapy depends on early recognition, followed by bed rest and regulation of nutrition during the acute phase, and the careful supervision of activity in convalescence.

The value of bed rest in the acute phase may be examined first An outbreak of hepatitis occurred in the US Army in 1942, resulting from the accidental inoculation of over 100,000 soldiers with an icterogenic lot of yellow fever vaccine It was observed that often the disease developed soon after a period of exposure to inclement weather or prolonged physical strain cence was frequently retarded in those individuals hospitalized late in the course of their disease, and recrudescences appeared in those patients discharged after relatively short periods of hospitalization Vigorous exercise too soon after discharge from the hospital had a similar effect It was a matter of grave concern in the armed services to note the rising number of hepatitis casualties developing in active war Many of these cases required repeated hospitalizations because they were returned to duty too early in convalescence It was, therefore, a matter of some military importance to determine the minimal hospitalization period, as well as the criteria for a "cure" An analysis was made of the effects of hospitalization, rest, and activity on the clinical course of 200 Naval cases at the Rockefeller Institute Hospital Many of the patients had arrived promptly after onset of their disease, others had been delayed enroute because they had become ill while at sea, or had presented some diagnostic difficulty at first was possible, therefore, to examine the over-all effect of these varying circumstances on the duration of convalescence and the severity of the chincal course in the average case of hepatitis

The Naval personnel with acute infectious hepatitis, admitted to the Rockefeller Institute Hospital, were divided into three groups according to the interval between the appearance of the first symptoms and the time of hospitalization No cases of chronic liver disease or hepatitis with complications were included. The diet was identical in all, consisting, on the average, of 150 Gm of protein, 60 Gm of fat, and 400 Gm of carbohydrate. The first group comprised 108 patients who entered the hospital in from one to fourteen

days following the onset of symptoms. This group remained in the hospital for an average period of 371 days. The average number of days of illness prior to hospitalisation added to this makes the average total duration of illness 46.3 days The second group developed symptoms in from fifteen to twenty nine days before they arrived at the hospital There were 62 patients in this group and they remained in the hospital 30 8 days, about the same period as the first group The total duration of illness was 51 1 days In the last group there were 19 patients who entered 30 or more days after onset This group after the institution of bed rest required 31.8 days of hospitalization before being considered well enough for discharge. The total illness lasted, on the average in these cases for almost three months (80.8 days)

Since the only important difference among the various groups was the number of days antedating the period of restriction of physical activity, the data indicate that a regimen of hospitalization and restricted activity shortens the total period of illness, while the amount of hospitalization required remains about the same for

all cases

It should be noted that these three groups of patients represented men of approximately the same age who were considered to be in robust health before the onset of their illness. A few cases had had some hospitalization before arrival, some had been in bed on hospital ships, others had been in and out of bed at varying intervals. Most of the cases, however, had had some activity before arriving at the hospital. The effect of bed rest on the alleviation of symptoms was pronounced. On arrival the patients suffered from fatigue, nauses, anorems, and other features of an acute illness. After bed rest these symptoms promptly subsided.

In these cases with antiafactory recovery of liver function and general improvement in clini cal state graduated activity was permutted cul minating in a ten-day leave period. At the end of this time tests of liver function were again performed In 18.5 per cent, abnormal tests as well as such aigns as enlarged liver with ten derness in some, and fatigue were found An additional period of hospitalization varying from three days to ten weeks and averaging twenty days, was required in these cases. Approxi mately one third had violated rules governing activity or had taken alcohol while on leave. If there is evidence of renewed or extended hepati tis, therefore, another long period of supervision with frequent evaluations of liver function is indicated. Full activity may be permitted only after two weeks of freedom from fatigue after moderate activity. The exact number of cases that may go on to subacute or chronic states is unknown, and an attitude of conservatism is justified in regard to rest in those few cases with evidence of lingering hepatits.

Diet plays a critical role in the recovery from hepatitis. Indeed, recovery often begins in long standing cases only after the patient is encouraged to eat. In a disease in which anorexia is so prominent and weight loss the rule diets require careful planning Thus, a diet low in fat may be unappetizing and not palatable, and may prolong the anorexia Recent experimental evidence does not support the contention that diets containing moderate amounts of fat are in jurious to nonobstructive hepatic diseases This conception was based on observations such as those of Messinger and Hawkins, who reported delayed liver regeneration on high-fat diets following araphenamine injury However the work of Best, Channon, and Griffith and Wade suggests that the inclusion of adequate protein and carbohydrate are probably protective, and may prevent any harmful effects from additional fat. In this regard, a comparative study was made on the time required for recovery in a group of 70 patients with acute infectious hepatitis half of whom received a diet high in fat and high in protein the other half a diet low in fat and high in protein. Not only were no harmful of fects observed to follow the administration of a diet high in fat in patients in whom the intake of protein was kept correspondingly high, but this diet appeared to have definite advantages over the diet low in fat with respect to adequate calone intake, especially in the acute stages of the disease. With the former diet, weight loss was minimal in the acute stages of hepatitis and gain in weight maximal in convalescence. In addition tests of liver function indicated a return to normal levels earlier in this group than in the other group on the low fat, high-protein regimen A liberal attitude in planning a diet that is adequate calorically us well as acceptable to the patient, will also make available greater amounts of fat-soluble vitamins and minerals Fried fats should be restricted because they are highly oxidized The vitamin A content is lost in fry ing because of the formation of perovides in the isoprene chain, and the fats become difficult to digest, especially in cases in which there are minimal amounts of bile present in the duodenum for emulafication. Fresh cream, butter, and eggs are sometimes said to contain the most easily digested forms of fat Meat fats are also highly digestible and, in addition, contain more methionine and the essential fatty acids.

It is now generally agreed that generous protein feedings are desirable in hepatitis. In 1938 Mann and Bollman of the Mayo Clinic stated that high-protein feedings diminished regeneration of the liver in a partially hepatectomized dog However, Goldschmidt, and later Whipple and Miller, demonstrated the effectiveness of high-protein feedings after chloroform anesthesia. By now there has been abundant confirmation of these findings, and it is believed by some that the high content of methionine, acting as a choline precursor, is at the basis of these relationships

The value of high-carbohydrate intake is recognized by all investigators. A damaged liver stores glycogen with difficulty, and hypoglycemia may develop in advanced disease states. This is overcome by the high-carbohydrate feedings.

An optimum diet should provide from 350 to 450 Gm of carbohydrate, from 100 to 125 Gm of protein, and from 80 to 90 Gm of fat min supplementation should be used in severe cases as well as in those in which anorexia is a If there is demonstrable vitamin K deficiency, the prothrombin level should be brought to normal with vitamin K administered parenterally In the anorexic patient diminishing plasma protein values may be elevated, if necessary, by adjuvant intravenous amino acids, or protein hydrolysate therapy better utilized if accompanied by intravenous carbohydrate Whole blood, plasma, and human albumin, however, are of greater value in enhancing depleted blood proteins nous fat preparations are still too hazardous for general clinical use

The effectiveness of methionine and choline in hastening regeneration of the damaged animal liver has been indicated. An experiment was planned to investigate the value of these adjuvants and liver extract by clinical trial. Isotonic saline was used in a control group of patients with infectious hepatitis. All patients in this study were maintained on diets containing, on the average, 150 Gm of protein, 60 Gm of fat, and 400 Gm of carbohydrate.

Sixteen patients with hepatitis comprised the group treated with methionine Each patient received 50 Gm of a racemic mixture of the amino acid in 200 cc of isotonic solution of sodium chloride intravenously on admission, and daily thereafter for ten days The material was well tolerated and induced no adverse effects In this small group it appeared from objective clinical signs, including the average net change in weight (a gain of 29 Kg), and the results of frequent tests of liver function, that the course of the disease was not perceptibly influenced by this form of treatment The average duration of illness in this group was 53 5 days Since the patients who received methionine were also receiving diets moderately high in protein, the results do not permit a statement regarding the possible

effectiveness of supplementary methionine in the presence of inadequate protein intake

In view of our incomplete knowledge of liver processes, we could not assume that methionine was nutritionally equivalent to choline in hepatic It was deemed necessary, thereinsufficiency fore, to give choline a separate trial in the treat-Twenty-five patients with acute ment study hepatitis comprised the group which received choline Each patient received 50 Gm of choline hydrochloride in divided doses on admission and daily thereafter for ten days material was well tolerated However, no effect was noted on the clinical course of the disease which could be attributed to the choline An average duration of illness of 50 7 days for the group of patients treated with choline was not significantly different from that of 53 5 for those receiving methionine, or 51 5 days for a control group receiving only saline solution age weight gain during convalescence for the patients receiving the choline was approximately the same as in the control group (3 1 Kg) In addition, a group of 34 patients with infectious hepatitis was treated with a specially prepared aqueous extract of Cohn's fraction G of liver, given in daily intravenous doses of 100 cc, diluted to 500 cc with saline solution, for the ten days following admission Preliminary tests for sensitivity and toxicity were carried out in each case before the full dose of 100 cc was given The material was well tolerated and no adverse effects were noted in any patient The difference between an average period of 489 days for the patients receiving liver extract and 51 5 days for the control group receiving only saline solution was not considered significant, nor was there a significant difference in average gain in weight (3 5 Kg) for this group over the control group or the groups treated with choline and methionine

In none of the foregoing groups is the number of patients large. As with the study on the effect of rest on the duration of hepatitis, the groups were made up of men of nearly the same age, presenting approximately the same degree of severity of the disease and all in nearly the same stage of hepatitis when therapy was begun. In addition, they had enjoyed excellent health prior to infection and were free of complications of any sort other than hepatitis. In each group, therefore, smaller numbers than would have been the case had there been greater variability in age, sex, and in the previous state of health, were required to yield significant data

Three prohibitions should be observed during acute hepatitis (1) the use of alcoholic beverages, since alcohol may aggravate liver damage already present, (2) the use of barbiturates and morphine, since detoxification which occurs in

the liver may be impaired and may result in prolonging the action of these drugs, (3) elective surgery, since during this period it may be attended by unusual risks.

A word may be said about the use of prophylactic gamma globulin in infectious hepatits, reports of which, especially by Neefe and Stokes, have been of recent interest in the literature. This material, which appeared to have promise in the treatment of homologous serum jaundice has little to offer in the therapy of naturally acquired infectious hepatitis.

In contrast to hepatitis, in which events move with great speed cirrhosis proceeds slowly and with more subtlety. By the time a patient with cirrhosis develops complaints, the process in his liver is usually well established anatomically though apparently less so physiologically. Patients with cirrhosis have been the victims, in the past, of illogical therapy.

Over twenty five years ago it was appreciated that a high-carbohydrate diet would protect the liver against chloroform phosphorus, and carbon tetrachloride injury. The important role of nutritional factors in liver disease was further indicated by the discovery in 1924 that a depancreatized dog would die with a fatty liver even if insulin were administered but that groundup pancreatic tissue added to the diet would prevent death. Nine years later, in 1933 Rao working in southern India, discovered cirrhoses in a nonalcoholic group of natives living on a diet of rice, who also displayed other nutritional Gilbert and Gillman reported a high incidence of cirrhosis in South African na tives in whom other dietary deficiency diseases were common and who subsisted on meager amounts of corn (maire), occasionally supplemented by fermented cows milk. Rats fed the same diet also developed cirrhosis. There is, however some disagreement among pathologists concerning the similarity of this cirrhosis to hu man cirrhoass. By 1939, when Goldschmidt and Whipple demonstrated the protective action of protein, the focus on the role of nutrition sharpened Sebrell produced currhosis in rats with diets low in casein and choline and then demonstrated that this was a reversible phenomenon when casein and choline were added to the diet. Extensive regeneration and hyperplasia of the liver accompanied this reversal

It is this type of data that suggests the value of the high protein diet. The value of supplemental choline awaits more extensive clinical trial. A study recently reported by A. J. Beams, of Western Reserve University presents pertinent data. Twenty two cases of cirrhous with assites received a high-proton diet alone, and a

similar number, a high-protein diet plus supplemental choine and cystine. At the end of one year 12 of the cases treated with choine and cystine had improved to the extent of losing ascites, the remaining 10 had died. Of the untreated group, only 6 were still alive. It is of interest that all of the improved cases had en larged livers which may indicate that they were early cases. No comment is made as to the exact dietary intake in the untreated cases.

The rationale of a low fat diet in cirrhosis may also be argued from these facts since choline and methonine are lipotropic. However, there is little convincing evidence that the diets contain ing moderate amounts of fat are harmful in cir rhosis. Indeed, an analysis of several so-called low fat diets indicates that much of the protein included is lipid bound which, when metabolized affords a source of fat not usually calculated in the In planning diets, therefore, dieticians should consider hipoproteins as potential sources of fat. The advantages of fat in enhancing palatability and affording better supplies of fatsoluble vitamins and certain essential unsatu rated fatty acids has been mentioned. During the episodes of acute hepatic decompensation that punctuate the clinical course of cirrhosis. when high degrees of biliary obstruction are present, digestive upsets may be avoided by a temporary reduction in fat intake

Emphasis on the nutritional factor in cirrhosis has been placed by Patek and his coworkers, who observed the frequent clinical coincidence of beriberi and pellagra-like syndromes in alcoholics and the occurrence of alcoholism in cirrhotic patients. They suggested there might be a correlation between alcoholism and cirrhosis on the basis of coexisting nutritional deficiencies They treated a group of cirrhotic patients with a highly nutritious, high protein diet supplemented with large amounts of vitamin B complex and Brewer's yeast. Twenty two per cent of an untreated control group were alive at the end of two years, 45 per cent of the treated group were alive at the end of this time Experimentally it is difficult to obtain water tight evidence that vitamins of the B group protect the liver from in jury or that the metabolism of this group of vita mins is faulty during hepatic insufficiency

In the case of vitamun A, however evidence is more pointed Not only is 95 per cent of vitamun A stored in the liver, but this organ is the only important site of the conversion of carotene and the carotenoid pigments into vitamin A. The vitamun A content of the cirrhotic liver may be as low as 10 per cent of normal and at least 50 per cent of currhotic patients have defective dark adaptation and night blundness (nyetalonia).

There is, therefore, reason to provide an adequate intake of vitamin A source foods, and to insure that plenty of carotenes are available for conversion to vitamin A within the capacity of the liver to do so

An occasional patient with osteomalacia and osteoporosis suggests the need for vitamin D Bile salts and additional calcium might be utilized to insure adequate intestinal absorption. With high-protein diets, however, the calcium intake is materially enhanced. A depression in vitamin K activity is common in longstanding cirrhosis and is indicated by low prothrombin values. Too often one encounters prothrombin levels that are fixed at moderately low levels and are rigidly unresponsive to vitamin K. Clinical experience suggests that fairly good residual liver function must remain to permit an effective response.

The use of blood and blood products has received much attention in nutritional problems Worthy of attention are the during the war studies of Thorn on salt-poor human albumin solutions as intravenous adjuvants in patients having low-serum albumin levels Five cirrhotic patients were treated by him for from one to ten days with 50 Gm of albumin administered intravenously daily, while being maintained on adequate diets low in salt patients treated for from one to three days developed a diuresis and mobilized their edema with a resulting weight loss In the absence of edema. diuresis was not observed with short periods of treatment, despite the presence of ascites spicuous elevation of the serum albumin was produced proportional to the amount of albumin administered Little of this albumin appeared in the urine, and 50 to 80 per cent was retained as measured by nitrogen balance studies suggests this as a promising form of therapy in (1) the severe currhotic patient who on dietary treatment alone can be maintained in positive nitrogen balance, but who cannot elevate his serum albumin, and (2) in longstanding acute hepatitis when anorexia gravely compromises dietary intake, discouraging positive nitrogen balance and normal blood albumin levels

We have had occasion to use this form of therapy in 6 cases of cirrhosis with ascites — In all but 2 far-advanced cases there was an impressive diuresis followed by disappearance of the ascites. One patient, after one course of therapy, has been free of ascites for three months. Another has been kept free of ascites with occasional retreatment, and, without additional treatment, has recently enjoyed two months without ascites. A third case required weekly abdominal paracentesis prior to albumin therapy but has since begun to void freely and spontaneously, and has had no further edema or ascites for one

A fourth case, now under treatment, remonth quired paracentesis every two weeks for a penod of five months prior to therapy A dose of 100 Gm of albumin given daily for four days has produced an immediate diuresis with absorption of the ascites and edema The fifth and sixth cases are far advanced but have shown some diminution in ascites and edema with an accompanying diuresis Although their improvement has been less dramatic than that of the first four. they have shown a visible increase in body tissue and decreased tendency for tissue wasting More data are necessary before the final evaluation of this form of therapy

The value of a crude water-soluble extract of Cohn's liver fraction G, from which pyrogens have been extracted, is under scrutiny now at the Rockefeller Institute Hospital and New York University Medical Service of Bellevue Hospital Ten to 20 cc of this extract, diluted to 50 cc with normal saline, may be given safely two to three times per week, if preliminary tests of tolerance and sensitivity are worked out first Statistics are now being compiled on two-year expenence with a group of patients who have been allowed to eat a diet much of their own choice, but in addition have received 20 cc of liver extract intravenously two to three times weekly

While an impression is gained that results are encouraging, final conclusions await the completion of our analysis. However, three sets of data are available for a rough comparison of treatment regimens in cirrhosis of the liver. The work of Patek and his group has shown that in an untreated control group of 386 cases taken from hospital records, only 22 per cent survived the first two years after the onset of some form of hepatic decompensation such as ascites, edema, interus, or hematemesis. In a treated group of 54 similar patients, closely observed while on a highly nutritious diet with large supplements of vitamin B and Brewer's yeast, 45 per cent survived the two-year period.

The New York University group, employing a crude intravenous liver extract, reports that at the end of two years, in a group of 33 cases of cirrhosis with ascites, treated by diet and moderate vitamin B supplementation, but not Brewer's yeast, 25 per cent survived In 27 similar cases receiving the same dietary management plus orude intravenous liver extract 65 per cent survived the two-year period The group studied at the Rockefeller Hospital has been a bit more In it there were 33 cases of cirrhosis, fortunate representing all forms of hepatic decompensation, treated with liver extract and observed over a two-year period Of this group, 28 patients, or 85 per cent, have survived to the present time It should be indicated, however, that these patients represent a more fortunate economic group. and are probably more cooperative. They have shown remarkable loyalty to biweekly therapy and with few exceptions have discontinued drinking alcohol One cannot overemphasize the agnificance of these differences, since the more difficult and less cooperative patients studied by Patek and the New York University group probably include severely addicted and chronically malnourished alcoholics In addition, it should not be forgotten that our patients were able to exercise wide selection in their diet, so that in most cases it included a high-calone and well balanced diet with adequate complements of animal and dairy proteins and natural sources of vitamins A more detailed analysis of our data is being undertaken at the present time

The patient with cirrhosis has many requirements. Most of these may be met by a highprotein, high-carbohydrate moderate-fat diet, supplemented with vitamins A. K. and perhaps D, the value of choline remains controversial and awaits greater experience. On the basis of the available evidence it is reasonable to assume that cirrhoses is a multiple deficiency state of which we recognize only a few specific deficien cies which we can relieve. It is reasonable therefore, to consider a diverse type of adjuvant therapy for such a complex syndrome involving so many as yet unrecognized metabolic defects. It is possible, in this manner, that with crude liver extract we may supply necessary factors not vet implicated

DR S S LICHTLAN The question of bed rest is one which I think needs no further emphasis here. One should insist on bed rest even in the mildest cases of infectious jaundice. In the past these have been considered too often as unimportant illnesses.

A negative nitrogen balance exists in liver disease. However, we must place these patient is a different category from those immobilisation appears to cause the negative nitrogen balance although this factor may also operate in liver disease. Large amounts of protein are also needed for regeneration. This would not change the plan of treatment since the requirements of the ailing liver include huge amounts of protein Often, because of poor food intake prior to the onset of his illness, the patient has already depleted his protein stores.

Every case of simple hepatitis or old fashioned catarrhal jaundice is a candidate for liver as rophy. I think it is most important to have the patient under observation, not only to feed him well, but also to observe every change from day to day. When the patient is under constant su pervision the physician is more likely to detect

that point at which the disease process may ad vance into a serious stage of chronic liver disease and act accordingly

As far as the factors of nutrition and diet are concerned. I find that the tendency now is for the younger physicians to think more about the new and forget the old Some of the concepts which we have held for years had their origin in sound laboratory work. One of the older, sound procedures, is that of the high-carbohydrate diet supplemented with intravenous glucose infusions Pathologists are now finding only rarely the type of liver encountered more commonly three and four decades ago when nationts did not receive the high-carbohydrate diet Therapy is apparently modifying the nathologic picture Patients are now taking methionine and choline religiously but unless the whole of the dietary intake is also zealously supervised treatment is incomplete Whether or not choline proves to be of permanent value in the treatment of liver disease. I am impressed with its of fect on the appetite Choline may bring about improved appetite directly or indirectly may correct vitamin B deficiency, or influence gastric motility through an acetylcholine mecha-Regardless of the mechanism the pa tient receiving choline is better able to cooperate with the enforced feeding program because anorexia is less marked. Thus, given for its lipotropic activity choline may prove to be of therapeutic value in a different manner

Recently, a paper by Barker, Capps, and Allen appeared in the Journal of the American Medical Association describing a new syndrome in which patients with hepatitis suffered a relapse when they were permitted to leave their beds and en gage in activities prematurely This publication rendered a great service not so much in the development of the theme of a so-called new clinical syndrome, but more in vividly emphasizing the need for continued bed rest in hepatitis despite the fact that the clinical impression is one of arrest of the disease. It is wise to continue bed rest for four to six weeks after liver function tests return to normal or become stabilized The natient is at first permitted bathroom privileges and sitting at the bedside. The first venture out doors is attempted four to six weeks later provided liver function tests remain stabilized

I would like to comment on the currently im proved results in patients with ascites. The first set of data presented indicated that control cases treated with intravenous saline infusions fared as well as the experimental group receiving choline and methionine. The deduction seems obvious yet another interpretation is admissible. In addition to intravenous saline the control group was receiving the optimum basic regimen.

high-protein, high-carbohydrate diet, etc therapeutic value of choline and methionine per se in the experimental group may be lost in a statistical survey of this type of material more satisfactory evaluation of these agents might be made in a group of patients with cirrhosis of long standing with innumerable paracenteses and marked protein depletion studies to date are of limited value in ascertaining the specific value of choline, methionine, or liver extracts, in obtaining the improved clinical re-The value of bed rest, vitamin K therapy, and ample diet must also be reckoned with There is a definite advantage in any method which reduces the number of paracenteses required, in the reduction of protein loss as well as of the risk of peritoneal infection

I would like to inquire about the cases receiving the salt-poor albumin. How much albumin was given to bring about the impressive results? Was the quantity of albumin insignificant compared to the remarkable diuresis established, or was the albumin given in such quantities as to change the plasma protein pattern and protein reserves in the tissues?

DR BUNN Dr Labby, would you care to comment?

DR LABBY As I have indicated, we have treated only 6 cases The procedure is as fol-In the morning patients were given 25 Gm of albumin dissolved in 100 cc which is given rather rapidly They can be given an additional 25 Gm in the afternoon so that the total intake for the day would be 50 Gm of albumin We discovered later that as much as 200 Gm of albumin could be given in one day with perfect In one case, the initial plasma albumin was about 19 Gm per cent Following two days of 200 Gm of albumin daily, the plasma albumin rose to approximately 28 Gm per cent Is that correct, Dr Shank?

Dr. Robert E Shank It finally reached 4 Gm

DR LABBY After how much total therapy?

DR SHANK After 500 Gm of albumin

DR SIDNEY GREENBERG One of the remarkable things following the use of albumin, in some cases, is the immediate tendency toward reversal of the albumin-globulin ratio, as though the patient were better able to utilize globulin. In such cases the globulin level may drop while the total protein remains the same. Do you find that is true?

Dr. Labby Yes, with supplements of albumin, because the total plasma albumin can be so materially enhanced, the total protein may even rise despite falling globulin values. There is also an increase in plasma volume so that at least

part of the effect on the globulin is due to dilu-

DR GREENBERG I would like to ask two questions How much salt is in your diet? In these patients with cirrhosis of the liver, was it thought that the ascites developed because of increased portal pressure?

DR CHARLES L HOAGLAND * We know that in some cases of cirrhosis there is portal hypertension and that can account for the fluid. However, the experiments performed on the surgical service of Presbyterian Hospital indicated that the portal pressures as measured from the splenic vein did not always correlate. Consequently, the tendency to ascites may have more to it than that

DR LABBY About the salt, Dr Greenberg, at the present time we have patients on what we call a low-salt diet. The food is cooked with salt but the patient gets none on the tray. As a substitute, a salting agent which does not contain sodium chloride is used.

DR GREENBERG Would you comment on the use of the mercurial diuretics in patients with edema due to cirrhosis?

DR LABBY I can give my own impression It may work temporarily but it does not strike at the basis of the mechanism of edema formation, the hypoproteinemia It is certainly the uncommon case of hepatic decompensation which is appreciably benefited by mercurial diuretics

DR HOAGLAND Often they are completely ineffective

DR LABBY Most cases appear to be relatively refractory to mecurial diuretics

DR WALTER MODELL I have just reread the conference on mercurial diuretics in the first published volume of these conferences, in which there is considerable discussion which fails to arrive at an explanation for the difference between the action of the mercurial diuretics in cardiac and cirrhotic ascites. Perhaps you can give us the answer. Why is it that usually there is a dramatic result in cardiac failure and so frequently none at all in the case of the ascites and edema of cirrhosis?

DR LABBY If the mercurial diuretics act in part by increasing salt excretion, one would expect a greater effect in cardiac failure with ascites than in cirrhosis with its associated hypoproteinemia.

DR HOAGLAND Some of us feel that there may be a hormonal influence which contributes to the picture of cirrhotic ascites. It is becoming increasingly evident that there are large amounts of estrogenic substances which appear in the urine

^{*} Dr Hoagland died August 2, 1946

Certainly, the estrogenic substances can modify water balance, as we know in the premenstrual, and similar states, where the estrogenic output may reach great heights. In the male, the 17-ketosteroids which indicate the course of androgenic metabolism are greatly diminished in the urne. We know, moreover, that in most cases with ascites, there is a phenomenal increase in antidiuretic substances in the urne. I think all these things have to be taken into account for the final explanation of the phenomenon of ascites. Certainly these factors are of less importance in the ascites of nephrosis and of cardiac failure.

Vistron Dr Lichtman mentioned the importance of the early detection of unfavorable signs in liver disease. I would like to know what the signs are and what can be done when they are detected.

Dr. Licetman Patients who are under active treatment whether jaundiced or not, and who show signs of liver damage, must have a battery of liver function tests performed at least at weekly intervals, to observe the various aspects of the course of the disease. These indicate whether the patient is improving or not, even though the degree of visible jaundice appears unchanged The tests include the albumin-globulin ratio A ree in albumin and/or total protein is a very favorable sign. A normal albuminemia which dropped, say 50 per cent, in spite of therapy, would be an ominous sign The cholesterol ester fraction is also significant. A decline in the total cholesterol and the ester fraction simultaneously indicates progressive liver damage. The galac tose tolerance test often helps to differentiate liver damage from biliary obstruction. When routine facilities are not available for the estimation of amino acids in the blood, the urea nonprotein nitrogen ratio is most helpful in advanced hepatic failure A rise in the blood nonprotein nitrogen and a fall in the blood urea are found under these circumstances. Additional routine tests performed are the icterus index, the bromsulfalein test, the cephalin-cholesterol flocculation, and thymol turbidity reactions. Guided by the results of these tests, the attending physician is in a better position to determine the severity of the illness and treat the patient more intelligently

DR. THOMAS P ALMY The use of parenteral amino acids has been suggested when the oral intake is not adequate in acute hepatitis. I wonder if we need fear the failure of deamination of these substances in the liver?

Dr. Hoagland I can site some experimental work. We have studied not only the ammonia nitrogen but the total nitrogen. The exerction of homologous keto acid appearing after various

amino acids provides important information These can now be measured with considerable case "We have not encountered much difficulty on the part of the decompensated liver to deaminate amino acids. This is evident from the extraordinary amounts of keto-acid and keto derivatives excreted, which show that the deaminating mechanism is intact although the metabolism of amino acids is incomplete. Only in very advanced states of hepatic insufficiency is there failure to deaminate. In none of our cases of hepatitis, and over 100 were studied with that in mind, was there any evidence of impaired deamination in so far as it was reflected in ammonia excretion and in the excretion of homologous acids of keto hydrates.

DR. LABBY I think it might be mentioned in that respect too, Dr Hoagland, that a patient may die from liver insufficiency with a normal blood urea nitrogen.

DR. HOAGLAND That happens very frequently

Dr. Bunn I would like to ask one question You suggested all patients with acute hepatitis should refrain from alcohol Is that restriction permanent?

DR. LABBY We happen to be working with a group of men who are in the Navy, and we appreciate, therefore, that we have two strikes against us. The usual procedure in warning the patient about alcohol is certainly not to drink at all during the ten-day leave period that follows convalencence. The patient on final discharge from the hospital is warned that at least a sixmonths' period should elapse before hard liquor They always ask, "How about an occasional beer?" Since one beer usually leads to another, complete restriction is probably advisable. How completely they will accept that is an individual matter The restriction, however. extends at least six months in a case which has gone on to measurable recovery

Dr. Alary As I recall Dr Hoagland sug gested that some of these cases of hepatitis go on to actual cirrhosis. What proportion of patents with cirrhosis have it because of a preceding hepatits?

DR. HOAGLAND In our series, at least, that is undecided at the moment, because they have not been observed for a long enough period. Some of these cases have been discharged with all the criteria of recovery, but some of them may develop cirrhosis eventually

Dr. LICHTMAN We have some information on that in Dr Patek's monograph on the records of over 400 cases in the files of several large hopitals in New York City Six per cent of the patients with portal cirrhosis gave a history of previous attacks of jaundice. On this basis it was

,

presumed that the cirrhosis was a posthepatitic complication

DR HOAGLAND If hepatitis were an important cause of cirrhosis we should expect to see more cirrhosis than we do among the numerous cases of hepatitis

Dr Labby The figures for the incidence of hepatitis vary, in the literature, from 3 to as much as 22 per cent. We are only now recognizing cases of acute infectious hepatitis without jaundice, they may have liver enlargement with tenderness, and the entire syndrome, but may never become icteric. A patient with cirrhosis, therefore, may have had hepatitis and the diagnosis never suspected because of the absence of icterius.

Summary

DR HARRY GOLD The conference this afternoon dealt with the treatment of hepatic insufficiency, commonly caused by infectious hepatitis and hepatic cirrhosis

Infectious hepatitis is a common disease afflicting about six million people in the United States. It is rarely fatal. Recovery is the rule after a protracted period of disability. The suggestion has been made that some of these cases may be the precursors of hepatic cirrhosis, although it seems to be clear that most cases of hepatic cirrhosis represent an independent disease which runs an insidious course and usually comes under treatment in the advanced stage in which the disability is largely the result of hepatic insufficiency.

The specific thereapeutic needs in any particular case, for the most part, are inferred from metabolic studies, the nature of the disturbances in blood chemistry, and from the results of a variety of liver function tests, which may show such disorders as an abnormal nitrogen balance, low blood proteins with disturbance in the normal blood protein pattern, diminished prothrombin. and diminished storage and utilization of various vitamins The same tests provide useful guides to the course of recovery While it does not necessarrly follow that abnormalities such as low blood proteins or low blood prothrombin, or the like, can be corrected by the administration of the corresponding agents, experience has shown that the feeding, or the parenteral administration of those materials which are abnormal in hepatic insufficiency, has a beneficial influence on the course of the disease

Opinion appears to be unanimous that bed rest is of paramount importance in the recovery from infectious hepatitis. The disease shows a very limited tendency to subside while the patient is up and about, it lasts on the average about a month if the patient is put to bed shortly after the onset, and if the patient is up and about for a

period of, let us say, a month after the onset, he may still require a period of about a month of bed rest to insure recovery

The literature contains reports of special benefits derived from various specialized diets In the conference today, we have heard from those with a large experience in the treatment of these cases, to the effect that no special diet does any better than one that is well-balanced and high in calories This one was suggested as optimal 400 Gm of carbohydrate, 125 Gm of protein, and from 80 to 90 Gm of fat not only adds to the calories but makes the food more palatable This helps to solve the problem of an adequate caloric intake since these patients suffer with anorexia and their nutritional state is apt to deteriorate unless an intake of sufficient If there is appreciable calories can be insured lowering of the blood prothrombin level, vitamin K by parenteral administration is added the blood proteins are significantly lowered, parenteral preparations are tried, such as protein hydrolysate, whole blood, human plasma, or Specific measures directed in part albumin toward reversing the process in the liver itself, such as choline, methionine, and the Cohn fraction G of liver have been tried, but there is as yet no satisfactory proof that they alter the course of the disease

In the management of hepatic cirrhosis, essentially the same principles are utilized similar to the one prescribed for infectious hepatitis may be used Since the disease is one of long duration, depletion of vitamin stores may become a matter of considerable importance, especially vitamin A which is stored largely in the Vitamin D and K may be absorbed poorly Large doses of all of these are often desirable There is some indication that the Cohn fraction The edema G of liver may prove to be useful and ascites due to hepatic cirrhosis are somewhat. resistant to treatment The mercurial diuretics are of some value The salt-poor albumin introduced by Thorn has proved useful in some cases for the control of the disturbance in water metabolism of the cirrhotic patient

In hepatic insufficiency, fried fats should be withheld, and alcohol, because of its damaging action upon the liver, is contraindicated. In the use of such medications as morphine and the barbiturates, attention needs to be paid to the matter of doses and intervals between them, since these agents depend largely on liver function for their elimination.

Patients with hepatic insufficiency are poor surgical risks, a factor which requires special attention in relation to elective surgery

As matters stand in the treatment of infectious hepatitis and hepatic currhosis, measures are di-

rected chiefly toward the maintenance of general nutrition. Although observations in animals provide interesting possibilities there are as yet no specific agents which are known to roverse the abnormal process in the human liver However, it may well be that the maintenance of a satisfac-

tory metabolic balance may protect the liver and help to restore its structure and function. The fact remains that with such measures as have been outlined in the conference today patients with infectious hepatitis recover more quickly and patients with hepatic cirrhosis live longer.

MORE PROTEIN FOR PREMATURE INFANTS

The care of the premature infant constitutes in pediatric practice a particular problem by itself, with fatthful attention to detail as the usual price of success. Three cardinal principles with their ramifications have long been recognized. These are maintenance of a suitable external environment with special reference to temperature and oxygen content protection against infection and suitable rourishment.

The necessity for the first two is in every case in mediate the third cannot be long delayed, and its problems are receiving renoved attention with recognition of the possibility that human milk is not necessarily the ideal food for the premature in fant, regardless of the value it may have for the full term infant.

Three Swedish investigators Jorpes, Magnusson and Wretlind, recognizing that the infant born several weeks before term has different nutritional requirements from the full term newborn infant, have devised a supplementary food consisting of all the essential amino acids. The mixture used, made by the enzymatic hydrolysis of casein with pancreatic ferments, was added to human milk and in every case was followed by considerably greater gains in weight than those that were obtained with human milk alone or when supplemented by unhy drolysed casein.

Although these reports are among the first on the direct use of the amino acids to improve weight gain of premature infants other writers have recognized the unusual needs of these patients for extra protein calcium and phosphorus. Thus Gordon and Levine, in 1944, stressed the wide variability in the nutritional needs of individual infants, whether breast or artificially fed, and pointed out the relative inability of premature infants to absorb fat, as evidenced by their frequent excessive loss of calories in the form of fecal fat. Not only are they apparently unable to utilize much fat in which human milk is rich, but also they especially need protein, calcium, and phosphorus, in which human milk is relatively low.

The implication is obvious human milk, designed by Nature as a suitable food for the average full term infant, must not be dogmatically and doggedly urged as the ideal food for all infants. Otherwise its employment needs no such unusual defense or apology as was offered by the medical student who, when required in an examination to state three particulars in which human milk is superior to cow's milk, wrote that it is cleaner that it is more directive comigestible and that it comes in more attractive com

HENRY'S WORM LOZENGES

Like our modern singing radio commercials is this choice bit taken from a late 10th century leaflet published in Burlington, Vermont.

The shades of night were falling fast,

As through a Down East city passed A boy who hastened straight ahead, And ever as he ran he said, Henry's Worm Losanges. When people asked him why so quick? He said, the baby's very sick, And I was told in laste to come
And with all speed to got him some
'Henry's Worm Lozenges.
The neighbors all have tred them well,
And they most wond rous stories tell
Of children cured of many illa,
By giving them, instead of pills
'Henry's Worm Lozenges.'

-Army Medical Library News Nov., 1946

GIANT CELL TUMOR OF THE PATELLA TREATED BY RESECTION

LEONIDAS A LANTZOUNIS, MD, FACS, New York City

(From the New York Orthopedic Dispensary and Hospital)

A CASE is herewith reported of benigh giant cell tumor of the patella with a pathologic fracture, in which the bone changes from the tumor preceded the injury and fracture. In a recent publication, F J Roemer (Am J Surg 67 563 (March) 1945) reviewed the literature of the existing case reports of giant cell tumor of the patella. There are now 22 cases, including the present case.

L J, a white man, 32 years of age, weighing 220 pounds, on May 9, 1944, while lifting a heavy plow with his knees in a flexed position, experienced acute pain in his right knee and inability to extend the knee. Within a few hours x-rays were taken, which revealed a transverse linear fracture of the patella at the junction of the middle and lower thirds with no displacement, no evidence of bone destruction or cavity, but considerable decalcification of the distal two thirds (Fig. 1). The existing decalcification and the patient's statement that for the past three months he had suffered moderate pain and

Presented at the Annual Meeting of the Medical Society of the State of New York Section on Orthopedic Surgery May 3 1946

Fig 1

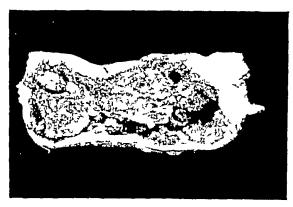

stiffness in the patella region, which were worse in inclement weather, caused a suspicion of bone tumor He was treated first with rest

On June 17, 1944, x-rays revealed the patella to be elongated, moderately broadened, and with its distal two-thirds considerably more decalcified than in the preceding x-ray picture. Clinically, the knee joint was swollen with increase of joint fluid, tenderness over the distal half of the patella, with passive motion normal, but no active extension. At this time, a plaster cast was applied from toes to groin and upon its removal on July 28, x-rays revealed further enlargement and decalcification of the patella. X-rays taken on September 14, 1944, revealed moderate improvement in the density of the patella (Fig. 2)

the patella (Fig 2)
On January 6, 1945, \-rays revealed marked decrease in density with considerable increase in the size of the patella Chinically, the right knee was swollen, with thickening of the tissues over the patella The patella was very much enlarged, moderately tender to pressure, with motion in the knee from 180 to 80 degrees and no active extension

Fig 2

F10 3

On January 13 1945, complete excision of the patella was done. It appeared to be a rounded tumor like partially irreturnerized mass of tissue measuring in greatest dimensions 8 cm. in length 8.3 cm. in width, and 4 cm. in thickness. ticular surface was slightly rough and croded and the inferior margin exhibited some nodular lipping by semitranslucent rounded masses of cartilage several millimeters in diameter Below the inferior border of the articular surface of the patella, there was a 1 5 to 2 cm wide zone of hyperemic, almost smooth surfaced tissue of alightly firm consistency other surfaces were convex and presented grayah-white tissue of rather firm consistency, exhibiting longitudinal markings characteristic of ligamentous Whan incised there was revealed a large central irregular surfaced cavity measuring 7.5 cm. in length, about 7.5 cm. in width and I to 8 cm. in dopth (Fig 3) It contained turbid, watery fluid One of its surfaces exhibited a membrane-like surface, mottled pinkish-red, and orange. Projecting into the cavity from all sides were many rounded or polypoid motiled-brown, yellowish brown, and red dish or orange-brown, partly spongy very soft, and partly friable masses of material resembling old blood clots. The outer wall of this cavity varied from 1 to 2 cm. in thickness was grayish-white and tough and imparted a gritty resistance to the cutting knife in places suggesting bone formation in peri

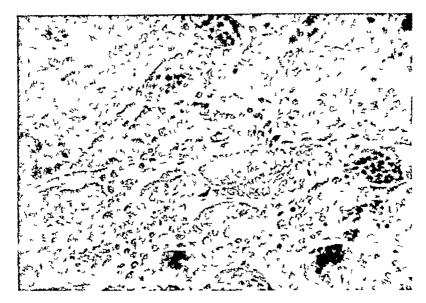

Operative Procedure —Through a 6-inch longitudinal inclaion centering over the patella, skin and subcutaneous tissues were inclised. The deep fascia and the quadriceps tendon expansion were gently and slowly dissected from the tumor mass and the patella tumor mass was removed in toto. A defect of about one and one-half inch between the quadriceps tendon and petella tendon was bridged over by splitting the quadriceps tendon and reflecting the antenor portion distally, which was then sutured to the patella tendon. The remnants of the tendinous expansion of the quadriceps were also satured to the tendon. A pleater cast was applied from toes to

groin for six weeks ment, motion in the knee has been restored from 180 to 110 degrees with normal active extension and normal stability in the joint. The patient does his regular work, has no pain and walks without a limp X rays taken April 18 1940 revealed the patella to be absent with no bone regeneration or evidence of tumor recurrence.

Pathologic Report.—The microscopic examination by Dr G Z. Garber was as follows

Socions through the central part of the tumor show many giant cells containing irregularly distributed nuclei varying in number from a few to 109 and averaging about 15 each (Fig. 4) Nuclei are round or irregularly rounded rather small, and vesicular Chromatin is commonly distributed in finely granular form and one nucleolus is present. Cytoplasm is acid-ophilic very finely granular and not infrequently exhibits vacuoles or foam-like areas Granules of yellowish brown pigment rarely occur in the cytoplasm. Small mononuclear poorly outlined stellate or polygonal cells make up the greater part of the tumor. Their nuclei are similar to those of the guant cells. Their pale-staining acidophilic cytoplasm varies from finely granular to coarsely granular and from finely reticular to rarely foam-like.

Some of the cells are phagecytic and contain ir regular sized brownish yellow iron-positive granules of old blood pigment and a few located in areas of extensive old hemorrhage, contain red blood cells. A very few rounded more sharply outlined forms of these cells show mitotic figures. Some larger rounded forms contain two or three nuclei and their cytoplasm stains like that of the giant cells. The appears that the giant cells are formed by growth of such cells. A few clongate forms are industinguishable from cells forming collagen fibers in some areas. The Laidlaw stain of tissue fixed in Bouns affuld reveals an abundance of roticulum fibers around and extending into some of the mononuclear cells. In the Bouln's fixed material the mononuclear cells are fiver positive cytoplasm and silver

F10 4

negative nuclei Cytoplasm of the giant cells is strongly silver-positive

Hemorrhage is very strking in some sections. Where red blood cells are most numerous, the giant cells are in the most active state of early formation. Rarely are fragments of red blood cells found in giant cells.

Although red blood cells are moderately well preserved in some places, there are large and small accumulations of red blood cells with barely recognizable outlines and almost complete loss of hemoglobin Several sections show one natural margin bordered by several layers of elongate cells Blood capillaries and small blood vessels are few in number In a section stained by Mac-Callum's method, no fibrin is demonstrated

Sections taken from the region of the periosteum and remaining cortical bone show dense ligamentous tissue, containing a moderate number of small blood vessels and infiltrated somewhat by lymphocytes and plasma cells Cortical bone is extensively eroded and mostly replaced by cells characteristic of giant cell tumor. Slight repair is seen in the presence of a small amount of osteoid tissue adjacent. Some tumor cells are found in large, endothelium-lined spaces in the periosteum.

A section, through articular hyaline cartilage remaining on the patella, exhibits fibrillar markings in a pale-staining matrix characteristic of degenerative arthritis. Subchondral bone and adjacent cartilage are eroded and partly replaced by giant cell tumor cells and poorly preserved red blood cells. Some slight repair of bone and cartilage is evident. The synovial membrane of the knee joint in section is edematous, hyperemic, and diffusely infiltrated by a few plasma cells and a considerable number of large, mononuclear wandering cells, containing brown pigment of disintegrated blood.

The pathologic diagnosis was that of a giant cell

tumor of the patella

NOTE OF CAUTION TO PHYSICIANS FROM THE FEDERAL BUREAU OF NARCOTICS

Under the provisions of the Narcotic Drugs Import and Export Act, it is unlawful for a physician to carry narcotic drugs in his medical bag back and forth between the United States and Mexico and between the United States and Canada Narcotic drugs found in the possession of a physician upon returning to the United States are seized and for-

feited Because of lack of knowledge of the law many physicians are caused embarrassment and inconvenience when traveling between this country and Mexico or Canada. This information is published in order that physicians may be correctly informed with reference to this provision of the Federal law.

EARLY LOCALIZATION WITH THE USE OF PANTOPAQUE OF AN ACUTE EPIDURAL SPINAL ABSCESS

ABRAHAM KAPLAN, M.D., and ARTHUR LAUTKIN, M.D. New York City

ACUTE epidural spinal abscess is a surgical emergency. It can and should be recognized before the onset of neurologic signs. Although this disease is reasonably rare, its characteristics are sufficiently distinctive to arouse early suspicions of an infection in the epidural spinal space. Studies of the spinal fluid dynamics will then establish readily the presence of a partial or complete subarachnoid block. When this is followed by myelography with the use of pantopaque the level of the lesion can be accurately determined

Clinically an acute epidural spinal abscess should be suspected when one obtains the history of an antecedent local infection such as a furuncle, par onychia, acute sore throat or osteomyelitis, fol lowed several days or weeks later by an acute onset of fever, chills, and excruciating back pain. On very rare occasions a history of an antecedent infection may not be ascertained. The patient appears acutely ill with some stiffness of the neck. The most sig nificant sign however is extreme localized spinal tenderness. With these findings spinal fluid studies are promptly indicated which invariably will show complete subarachnoid block, xanthochromic fluid and increased total protein. Myelography with pantopaque abould follow immediately The level at which the opaque media is arrested will accurately establish the site of the pathology

Prompt surgical treatment must follow not only to save life but perhaps more so to prevent the tragic complications of paralysis, bladder, and rectal dysfunction, decubitis, ascending urmary infection and a drawn-out death from renal failure

Whether the infection reaches the epidural spinal space by direct extension or as a septic embolus from a remote focus the pathology that follows, so well described by Hassin's chiefly that of vascular occlusion of the rich venous piexus surrounding the cord with extension of soptic thrombosis of the veins within the cord and secondary myelomalacia. This process unless halted by surgical intervention will frequently advance with hourly rapidity and with irreversible damage to the spinal cord. In the recent publications of Campbell's Cohen's Echols's Prowder and Meyers, Buckstein's Cann's and others, one finds repeatedly the tragic evidences that patients with acute epidural spinal abscess are rarely recognized before serious damage to the

In a collected study of 103 cases of acute epidural spinal abscess by Boharas and Kaskoff the condition was first recognized at autopsy in 33 cases 1 case was diagnosed after the onset of meningits and subsequently died. The diagnosis was delayed and operation deferred until the onset of paralysis in 64 petients. Of these, 37 died 12 recovered with residual puralyses and 15 recovered completely. In only 5 cases was the diagnosis made relatively early and these patients all recovered completely. On must therefore conclude that to wait for a sensory

spinal cord has already taken place

level in a patient suspected of an epidural abscess is to invite progressive myelomalacia of the spinal cord with resulting paresis, sphincter disturbance, and not infrequently a delayed fatal outcome

A careful search of individual case reports shows only 4 cases in which the diagnoses of epidural spinal abscess was made before the onset of neu rologic signs. In each case laminoctomy was per formed promptly and all recovered quickly and com-Slaughter, Fremont-Smith, and Munro* should be credited as the first to recognize and treat a metastatic spinal epidural abscess before the appear ance of neurologic signs suggesting spinal cord com-In Cohen st series, case 4 which had a metastatic epidural spinal abscess secondary to osteomyelitis of the long bones, was the only one operated before the appearance of neurologic signs Stanley s11 case I and Van Den Berg's12 case I were both recognized before the onset of neurologic signs. Laminectomy in all these patients was performed within several hours after the diagnosis was suspected and all recovered completely

To the above small group we wish to add another case report of a prompt and complete recovery of an acute opidural spinal abscess that was operated upon before the appearance of neurologic signs. As far as can be ascertained after a thorough search of various case reports, this is the first case of an acute epidural spinal abscess in which pantopaque was used to localize accurately the site of the spinal block.

Case Report

M B S agod 23 years was admitted to the hospital on February 14 1946 complaining of severe back pain. He had been recently discharged from the Army, and though he spent many months in the Pacific area he was never troubled with malaria. He had been on atabrine routine until shortly before his return to the mainland. One week before admission he had rhinitis and a sore throat which were not severe enough to restrict him to hed Two days later he was awakened at night with a sudden chill and fever Three days before admission he began to complain of increasing severe back pain over the lower thoracie region which was accompanied by headache and stiff neck.

At the time of admission the patient appeared acutely ill. There was a yellow tint to the skin caused by atabrine. His temperature was 1014 F, pulse 80 per minute respirations, 16, blood pressure 108/65 There was definite stiffness of the neck, which, when flexed intennified the back pain Straight teg raising was painful and kernig sign was positive on both sides. Tenderness was exquisite over the eleventh thoracic spine. General physical and neurologic examination were otherwise completely negative.

Laboratory studies showed a leukocytoms of 22, 600 per cubic millimeter with 70 per cent segmented forms 14 per cent lymphocytos, 4 per cent monocytos, and 3 per cent band forms. Blood smear for malaria was negative. Urine analysis was normal Hemoglobin was 91 per cent and rod cells 4,850 000

Fig 1 Fluoroscopic "spot" film showing delay and deformity of pantopaque column at the eleventh thoracic with table tilted 60 degrees cephalad

per cubic millimeter Kahn test was negative, non-protein nitrogen, 24 mg per cent, chlorides, 490 mg per cent, creatinine, 10 mg per cent Sedimentation rate was 26 Total protein of the blood was 24 with albumin 33 and globulin, 172 Studies of the spinal fluid showed complete subarachnoid block with vanthochromia, total protein 205 mg per cent, sugar 403 mg per cent, chlorides 725 mg per cent, 8 red cells, and 9 leukocytes per cubic millimeter Smears of the spinal fluid failed to show any organisms and culture showed no growth

On the following day the patient still had fever and the back pain was so intense the patient could hardly stir. Neurologic examination still showed stiffness of the neck, bilateral Kernig, but no sensory, motor, or reflex abnormality. Temperature was 102 F. and pulse 100 per minute. During this period of observation the patient received 250,000 units of penicillin without any appreciable alteration.

of the clinical picture

Preliminary to roentgen examination, a lumbar
puncture was done, removing the stylet of the needle
at frequent intervals to detect any extradural pus if

present. None was encountered The spinal fit was clear and showed a total protein of 95 mg r cent. No organism was found on smear or culty and no pedicle formation was observed

Five cc of pantopaque were injected into t subarachnoid space and the flow of the opaque in terral was observed under fluoroscopy on the table. There was no evidence of delay in the flow deformation of the column of pantopaque until reached the upper portion of the eleventh thorax vertebra. At this level with 60 degrees cephalad to of the table there was a marked lag in the flow of t pantopaque and the column appeared narrowed as constricted at the level of the interspace between t tenth thoracic and eleventh vertebra. The was some pooling of the pantopaque along the lateral margins of the subarachnoid space distal the level of partial obstruction (Fig. 1)

Laminectomy in the lateral position was performed promptly. The spines and laminae from t eleventh thoracic to the eighth thoracic were is moved Bleeding from the skin, subcutaneous t sue, and overlying muscles was more profuse the usually encountered in a laminectomy at this lev-Upon the removal of the eleventh thoracic spine at iaminae, extradural granulations were observed catheter was directed cephalad which yield several drops of thick pus. Smear of this materi was immediately reported as showing gram-positi No acid-fast organisms were foun The laminectomy was extended up to and includit the eighth thoracic spines and laminae The extr dural granulations could be peeled off the dura emulsion of penicillin and sulfadiazine was sprayi into the wound, a catheter for irrigation was placin the depth of the cavity and the wound clos The wound was irrigated dai tightly in layers with the emulsion which contained 10,000 units

pencillin and 15 Gm of sulfadiazine per 10 cc
Culture of the pus obtained at the time of the operation showed pneumococcus type 1. The patient continued to receive pencillin and sulfadiazine for twelve days, a total of 4,800,000 units of pencillin and 62 Gm of sulfadiazine.

The postoperative course was remarkably useventful. During this period the highest temper ture was 99 2 F and pulse 100 per minute. Cathet irrigation with the emulsion was discontinued aftithe sixth operative day. The wound healed the primary union. The patient was out of bed by the end of the first postoperative week and was read for discharge a week later.

The pathologic tissue removed at operatic showed dense vascular granulations contains polymorphonuclear cells, lymphocytes, histocyte fibroblasts, and red cells. There was evidence of a tensive diffuse hemorrhage and fibrin enmeshin polynuclear and red cells.

The diagnosis was acute inflammatory tissue

Discussion

Some may feel that large quantities of penicillishould be administered to a patient suspected of a acute epidural spinal abscess while waiting for localizing neurologic signs. It is therefore well to point out that the patient herein described receive 250,000 units of penicillin before the diagnosis we even suspected without the slightest influence on his general condition, the fever, or the pain. With prompt and adequate surgery and the combined administration of penicillin and sulfadiazine we were able to obtain a most gratifying result. Instead of

chronic discharging wound for weeks (the usual experionce before the days of sulfa drugs and penicil

lin), the wound healed by primary union In a patient suspected of an epidural spinal ab-

scess lumbar puncture must be done cautiously The stylet of the needle should be removed periodically in order to detect the presence of pus at the site of nuncture and to avoid the danger of introducing infection into the subarachnoid space. If pus is en countered in the extradural lumbar space, then drainage should be instituted at that point. But if xanthochromic fluid is obtained and subarachnoid block has been demonstrated then there should be no hesitation in introducing 3 to 5 cc of pantopaque to establish accurately the level of obstruction Waiting for localizing neurologic signs under these conditions is no longer justifiable

Summery

A case of an acute emdural spinal abscess has been

reported in detail, stressing the points of early diagnosis and accurate localization with the use of pantopaque.

WHAT DOES THE MEDICAL SOCIETY OF THE STATE OF NEW YORK DO FOR ITS MEMBERS?

Malpractice Insurance

Members of the Medical Society of the State of New York as a body constitute a very large group of in surance buyers whose premiums for the six or eight most common forms of insurance amount to more than \$5 000,000 a year. With the exception of malpractice insurance and to some extent, accident and health protection members buy their insurance as individuals the same as all of their other personal requirements. They are able to do this in a sound and economic manner because competition among the large number of life, casualty, and fire insurance companies has brought about stabilized rates and generally uniform practices and policy contracts

Malpractice insurance, however, is the outstanding exception to this rule and, to appreciate why that is so it is necessary to understand that professional liability because of the limited volume of it, is only an unimportant sideline of a few companies in the country. This lack of competition has led to a wide variation in policy forms rates, and defense sorvice rendered which, coupled with a more ress take-to-releve-it attitude on the part of the companies has at times produced chaotic situations in various states.

In 1920 conditions in New York State became so unsatisfactory for medical men that the State Society in self-defense felt obliged to inject itself into the situation. After a long and thorough study of the entire inserf-decrees introduced to inject them into the situation. After a long and although study of the entire subject, the Society decided that the only way it could influence matters was to organize its members into a buyers' group which collectively, would be strong enough to make itself felt in the insurance market. This led to the formation and adoption by the Society in 1921 of an undertaking which became known as the Group Plan of Malpractica Insurance and Defense of the Medical Society of the State of New York, or the New York Group Plan, as it was referred to outside the State.

It is not the purpose of this article to summarize the details of the plan That has been admirably done in a booklet entitled The Group Plan of Malpractice Insurance and Defense published by the Society last Group Plan fully accomplished the purposes for which it was organized. It provided a policy contract drawn by medical men to meet their own needs. For the first time in the history of malpractice indemnity, it combined specialized and highly efficient legal defense service with insurance And it controlled and stabilized rates at the lowest level consistent with the high quality of indemnity and defense furnished.

Supervision of the Group Plan has grown during the twenty-six years since its organization to be one of the major activities of the Society This supervisory function is exercised by a special committee of the House of Delegates known as the Malpractice Insurance and Defense Board composed of five members only one of whom is changed each year In addition the Board is assisted by four ex officio advisors, consisting

one of whom is changed each year. In addition the Board is assisted by four extensions advisors, consisting of the secretary treasurer legal counsel and indemnity representative of the Society. Without the Group Plan and its domination by the Society, control of malpractice insurance in New York would revert to the companies who, as in the past, would issue such policy contracts as they saw fit to publish, furnish such legal defense as could be supplied by their general attorneys and charge such rates as they considered necessary to insure a profit for themselves. In 1920 the company writing about 80 per cent of the malpractice insurance in New York raised its rates to \$45 and there is nothing in subsequent experience to indicate that that rate would ever have been lowered. Under the Group Plan of the Society the average rate over the last twenty-six years has been only \$27.76. Thus in this activity alone the Society. saves for its insured members each year a sum considerably in excess of their annual dues.

PUBLIC MEDICAL CARE

THIS is an interim report on the cooperative efforts of the Medical Society of the State of New York, the New York State Association of Public Welfare Officials, and the New York State Department of Social Welfare in developing Public Medical Care Programs under the Social Welfare Law (December 1, 1946)

Introduction

the local plans

Public medical care as administered under the New York State Social Welfare Law has progressed substantially since 1941, when the State Medical Society and the New York State Department of Social Welfare adopted seven cardinal principles* as the basis for development of such programs

The wisdom of these principles is reflected in the present status of these programs, which have reached their highest development in history, and which now include local approved medical care plans that cover 90 per cent of the State total assistance caseload

While substantial progress has been made, a number of problems have remained unsolved Physicians, welfare administrators, and public medical care consultants or directors were anxious to consider these problems in the light of the experience of past years. Furthermore, all groups were interested in further implementing the seven basic principles, clarifying and strengthening medical-welfare relationships, extending improvement and progress through other means, including a more adequate schedule of fees, and reviewing the vast strides made in the last five years in development of

To bring to bear upon these problems and deliberations all available experience, the New York State Association of Public Welfare Officials was requested to appoint a committee to work with the State Department of Social Welfare and the State Medical Society. A committee appointed by the President of the Association met with representatives of the State Department of Social Welfare in November, 1945, and later with the State Medical Society. As a result of these meetings, recommendations were made by all groups for the appointment of a subcommittee to consist of representatives of the State Medical Society and local welfare medical consultants or directors. Six of the latter were chosen, representing different types of public welfare districts and different kinds of programs.

districts and different kinds of programs

Thus, again, representatives of local public welfare administrators physicians who direct local medical programs, representatives of the State Medical Society, and members of the State Department of Social Welfare were brought together to consider ways and means of developing and improving public medical programs of the State Frank and fruitful discussion brought about agreement that a continuing working committee was needed to review in detail all medical care policies, practices, fees, and allied factors involved in medical programs. The Public Medical Care Committee of the State Medical Society decided itself to serve on this joint working committee rather than appoint a new group of physicians for this purpose.

* Attached to end of report (revised February 3, 1947)

1946, the Joint Committee met monthly In June and late in 1946 the Joint Committee met with the Advisory Committee of the Association of Public Welfare Officials At these meetings full data regarding problems and practices, assembled by the State Department of Social Welfare, were available for review, analysis, and discussion With the over-all facts before it, the Joint Committee addressed itself to the basic problem of how the best medical care could be provided for the medically indigent

Accomplishments

A summary of the major achievements of the joint committee follows It was unanimously agreed that the most important result was the Joint Committee's approach to the problem of public medical care The Committee functioned as a total unit, rather than a collection of different groups, each seeking to promote its own interest and each playing its own group role At many of these meetings representatives of the State Association of Public Welfare Officials showed interest in, and concern for, the medical point of view, and representatives of the State Medical Society expressed similar interest and concern about the welfare viewpoint Above all clse, the physicians were interested in the provision of the best quality of medical care possible. In other words, the Joint Committee saw that the objective of providing public medical care involved a common understanding of all aspects of the problem, a common approach in dealing with those problems, and, most important of all, a common concern for the health and welfare of the patient

Local public welfare administrators demonstrated their recognition of the importance of medical considerations and professional guidance of medical programs when they recommended that a group of their local medical consultants or directors be appointed to work with the Joint Committee. The experience over the last five years in developing and operating medical programs pointed up and clarified the primary, important role of professional medical direction of such programs. Public welfare administrators appreciate the progress possible under

such competent professional guidance

The third significant development involves protection and promotion of local autonomy, through which local welfare agencies and county medical societies may establish their own medical fee schedules, within the broad framework of a total program set up by the State Department of Social Welfare and within the Department's schedule of Statereimbursable fees. The localities are free to negotiate, against their own local background, relationships and fees best suited to fulfill the individual public medical care needs of the community. Local medical care consultants, or directors, are thus able to set the necessary detailed standards for all kinds of medical care and utilize all available facilities and methods to improve such standards in their own communities.

Another principal achievement of the Joint Committee was the total review and revision of all existing fee schedules and policies relating to fees, a task that involved considerable discussion, time, and

ffort This tremendous undertaking was not nerely a matter of increasing fees in line with ad ancing costs, but involved consideration of prin-ples and policies as well. It also embraced the evelopment of fee schedules for items not pro-fously covered. More than this it involved con ideration of a subject that for a number of reasons ad not been officially included in the discussion in 941 when the State Department of Social Welfare nd the State Medical Society first got together to ormulate basic principles for guiding public medical At that time it was decided that are programs undamental policies had to be set, that structure of ervices had to be built, and that a body of experi-nce had to be developed first. The Joint Com alttee this year agreed that there should now be stablished a new schedule of State reimbursement ates. The State Medical Society recognized the xistence of different fee schedules among the various tate departments but did not approve of this conhtion. Furthermore, the Chairman of the Public Medical Care Committee recommended that the state Department of Social Welfare reimburse at he rate of the Workmen s Compensation Fee Sched de. When the point was made that an insurance oregram schedule was not adaptable to a welfare rogram, and after all other factors were discussed he Joint Committee agreed that the State Depart nent of Social Welfare should establish a schedule t the highest rates possible, and that it should no onger maintain two schedules—one for approved ocal medical plans and one for medical care services ot given through an approved local plan. All roups agreed that the new schedule of reimbursenent should not be revised before December 31

The council of the State Medical Society recomnended that it be made clear to all persons conerned that the fees do not represent the full value of he medical services given and that the State Medial Society would undertake to seek any necessary ovisions in such schedule after December 31 1947 The need for advice from certain specialists, both n setting up standards and determining fees within certain specialties was recognized. The State Medical Society appointed active subcommittees to dvise on such matters.

Unanimous agreement was effected regarding a letailed surgical fee schedule, with its basic prin uples to be published in addition to the fees already sublished by the State Department of Social Wel are

The Chairman of the Public Medical Care Com nittee promised the cooperation of the State Medical society in interpreting to New York State local physicians the background of the new fee schedule and the basis for its determination. The Com nittee also agreed to continue to encourage the deelopment and improvement of medical care prorams through urging local medical societies to copurate as fully as possible with local public welfare sencies in further strengthening such programs. Similarly the State Department of Social Welfare ugreed to encourage local welfare agencies to work cooperatively with the local medical societies in building the best possible local medical care protrams.

The Future

947

The Joint Committee will continue, and its mom burs believe fruitfully its efforts to obtain the bost quality of medical care possible for needy personsat few that protect the interests of both the medical profession and the taxpayers in localities throughout

the State-and to build effective working relation ships of all who participate in such programs.

Further discussion of general principles and broad policies relating to the provision of medical care is also an objective of the Joint Committee Through such cooperative discussions, the Joint Committee can advise and aid the State Department of Social Welfare in preparing a manual of medical care, a comprehensive document that will embrace the total program—philosophy, standards, and practices and will serve as a guide for its efficient administra-tion and as a schedule of State reimbursement. The New York State Association of Public Welfare Offi cials, the State Medical Society and the State Department of Social Welfare realize that the effective cooperation developed on the State level must also be promoted in the local communities. It is only through cooperative efforts of physicians and public welfare administrators State and local that the chief goal of a high standard of medical care service can be realized for the needy persons of the State All three groups are keenly aware of this situation and are highly desirous of doing everything possible to achieve this goal.

Seven Principles

The medical aspects of medical relief should be super-vised by the medical profession.
 All physicians should be ancouraged to participate in

All physicians anoted be encouraged to participate in the service of physician should be guaranteed subject to protective limitations.

5 Contract practices for medical relief should be dis-

approved
6 Chnics should not be exploited to avoid payment of
feee for service. They should be used when medically de-

resistable.

7 Provisions should be made to enable needed medical care to be furnished for indigent and near indigent families not otherwise sligible for relia!

MEDICAL NEWS

Research in Heart Disease Aided by Insurance Fund

MORE than a half-million dollars for research in heart disease will go out to United States and Canadian colleges, hospitals, and students from the Life Insurance Medical Research Fund in 1947, it has been announced by M. Albert Linton, chairman of the Fund. The 1947 allocations raise the total of all funds granted by the organization since 1945 to well over the million-dollar mark.

Forty-eight separate grants-in-aid, 13 postgraduate fellowships, and one student fellowship were listed in the Fund's announcement. All of the research and study being sponsored was confined to problems in diseases of the heart and arteries, which in the United States is now the most prevalent cause

of death

Supported by 148 legal reserve life insurance companies in the United States and Canada, representing 93 per cent of the life insurance in force in the U.S., the Medical Research Fund is administered through a board of directors comprised of leading life insurance executives and an advisory council of medical research experts. Scientific director of the

Fund is Dr Francis R Dieuaide, clinical professor of medicine on the staff of the College of Physicians and Surgeons of Columbia Hayaretty

and Surgeons of Columbia University
Grants-in-aid, ranging in value from several
thousand dollars to more than \$30,000 and covering
periods of research ranging from one to two and onequarter years, were announced for 32 medical colleges and eight hospitals located in 19 states, the
District of Columbia, and three Canadian provinces, the 14 fellows are from six states and two
Canadian provinces This year's allocations raise
the Fund's total research grants since 1945 to \$1,-

Two types of fellowships are granted by the Fund, the senior fellowships to graduates who have a doctor's degree and student fellowships to undergraduate students in medical schools who wish to take an extra year for training in scientific research. Both senior and junior awards are for work and study at approved institutions under specified supervisors,

and range in value from \$1,500 to approximately

\$4,000

Cancer Society to Finance Research Projects

THE American Cancer Society has allocated \$1,559,734 of 1945 to 1946 contributions to finance more than 130 projects of scientific research in effort to determine the cause and control of the disease

Including twenty-three fellowships to train promising scientists in advanced methods of research, the allocation increases the total projects financed by the Society to 240, and the total of fellowships to

forty-eight The Society's aggregate cost of research now amounts to almost \$3,000,000

Included in the recent allocation are two institutional awards a \$250,000 grant to the Sloan-Kettering Institute for Cancer Research, of New York, and a \$50,000 grant to the Barnard Free Skin and Cancer Hospital, of St Louis These are the first institutional grants ever made by the Society

New York City Will Receive New Blood Service

A CIVILIAN blood donor service was started in April by the New York City chapters of the American Red Cross in cooperation with the Coordinating Council of the Five Country Medical Societies of Greater New York

Patients in five municipal hospitals, Bellevue, Kings County, Morrisania, Queens General, and Sea View, will be the first to benefit by the new program, which is similar to those in other cities, including Los Angeles, Cleveland, and Detroit

Home Care Urged for Blind Babies

PROLONGED institutional care for very young children makes them impossible to educate or train for full, normal life, Dr. Laurette Bender, assistant professor of psychiatry at New York University declared March 13 at the opening session of the National Conference on the Blind Preschool Child

Sponsored by the American Foundation for the Blind, the conference was called because of the marked increase in the number of blind babies, many of them premature infants who, a decade ago would not have hved Many surviving incubator babies develop blindness or defective sight for which no prevention or cure has been found

Personalities

Dr Eva J Weddigen, formerly of Memorial Hospital City Cancer Clinic in New York City has established a medical practice in Newfield

Dr Weddigen received her medical training at the universities of Berlin and Hamburg in Germany and at the University of Birmingham, England She worked as a medical missionary for six years in Ado Ekiti, Nigeria British West Africa.*

Dr Frank D Allen, a practicing physician in Richville for the past fifty-seven years observed his eighty-seven the birthday anniversary in March at a quiet family dinner held at his home. He has been an active practitioner since 1888 Dr Allen was a coroner in St. Lawrence County for more than twenty-seven years. He held the post of health officer of the town of Dekalb for several years and carries out the duties of health officer *

Dr. John Frederick Erdmann of New York City who has been practicing in New York since 1887 observed his eighty third birthday anniversary

March 27

Dr Erdmann was chief of surgery at Post Graduate Hospital until 1934 when he resigned to He has been devote himself to private practice. He has been associated with many of the leading hospitals in the metropolitan area since his graduation from the old Bellevuo Medical College in 1887 *

Dr Hartley Zwahlen, of Utica, who has comploted terminal leave and a subsequent three months postgraduate course at the New York Poly clinic Hospital, has opened an office in Utica for the general practice of medicine He received his medical degree from Albany

Medical College in 1941

Dr Zwahlen interned for a year in the United States Marine Hospital Norfolk, and then was com-missioned and spent four and a half years with the United States Public Health Service.

Dr Ernest Hermann has opened offices in Canandaigua. His practice will be limited to his spe-

cally of eye our nose and threat diseases.

A native of Vienna, Austria Dr. Hermann was graduated from the Medical School of the Univer sity of Vienna in 1930 and came to this country in 1938 when the Germans occupied Austria. After several years of general practice Dr Hermann received a fellowship in the ear, nose, and throat department of the Flower and Fifth Arenue Hes-pitals in New York in 1944 in 1945 to 1946 he was a realdent physician at Green's Eye Hospital San Francisco

Dr J A. DeBlase of Schenoctady has resumed his practice after completing postgraduate courses in cardiovascular diseases and diseases of me-tabolism at the George Washington University School of Medicine and at Gallinger Memorial Hospital Washington D C

Dr DoBlase is a graduate of Union College and St Louis University School of Medicine He previously has taken postgraduate studies in internal medicine surgical diagnosis and roentgenologic studies in gastrointestinal and cardiovascular dis-

cares Prior to his discharge from the Army Dr Do-Blase was for three years chief of the department of cardiology at Camp Forrest, Tennesece and for two years chief of cardiovascular diseases in the 141st General Hospital In 1942 he was appointed consultant in cardiovascular diseases for prisoner of war camps in Tennessee

Dr Charles E Pierce of Watertown, one of the outy's oldest practicing physicians on February 18 quietly observed his seventy-fifth birthday and in March observed the fiftieth anniversary of his gradu ation from medical college

The doctor has followed his profession in Water

town continuously since 1809

Dr Pierce was graduated from the Bellevue Hospital Medical College of New York City new the New York University Bellevue Medical College

on March 22, 1897

Following his graduation from medical college Dr Pierce was qualified by the Bellevue College for appointment to the house staff of physicians and surgeons of the college. He started on the staff in October 1897 as junior assistant surgeon, subsequently was senior assistant, and, finally was house surgeon completing twenty months of residence in

the hospital in 1809 Dr Pierce came to Watertown after completing his service as house surgeon of the medical college

and began private practice here in July 1899

Dr Pierce is a member of the Jefferson County Medical society and for years was its secretary He is a member also of the State Medical Society the American Medical Association, and the Alumni Association of Bellevue Hospital Medical College *

Dr Maurico L. Tainter of Rensselaer, vico-president of Sterling Drug Inc. and director of the Sterling Winthrop Rosearch Institute, has been elected an honorary member of the Society of Pharmacology and Thorapeutics of the Argentine Medical Association of Buenos Aires

Dr Paul C. Campbell Jr formerly of Buffalo, U.S. Public Health Service, has been appointed chief of the Office of Dermatology, Industrial Hygiene Division, U.S. Public Health Service Foderal Security Agency

Before taking a commission in the US. Public Health Service in June 1941 Dr Campbell spent three years as a resident and one year as chief resi dent in dermatology and syphilology at the Edward J Meyer Memorial Hospital in Buffalo He also

J Moyer atomoria mospital in buttato no also appent a year in private practice in association with Dr Earl D Osborne He is a graduate of the University of Buffalo, School of Medicine Dr Campbell is a member of the Eric County Medical Society the State Medical Society the Buffalo-Rochester Dermatological Society and the American Public Health Association He is an associate member of the American Academy of Der

^{*} Asteriak indicates that item is from a local newspaper

matology and Syphilology, a fellow of the American Medical Association, and is affiliated with the Baltimore-Washington Dermatological Society

The Committee on Fellowships and Awards of the American College of Surgeons has awarded five additional research fellowships in medicine for the year which begins July 1, 1947 In New York State a fellowship has been awarded to Dr Mary Ann Payne, of New York City

Dr Payne will undertake at the New York Hospital, where she presently holds appointment as assistant resident in medicine, studies of hepatorenal factors in regard to shock and hypertension Her supervisors will be Dr David P Barr, F A C P,

and Dr Ephraim Shorr Dr Payne is a native of Braddock Heights, Maryland Her undergraduate work was done at Hood College, she received the degrees of Master of Science (1941) and Doctor of Philosophy (1943) degree from the University of Wisconsin Dr Payne completed her medical course at the Cornell University Medical College in 1945, following which she served as intern in the New York Hospital

Dr Samuel Weiss, of New York City, had the degree of Doctor of Science conferred upon him at the one hundredth graduating exercises of Hahnemann Medical College, Philadelphia, on April 3

County News

Albany County

A panel discussion on syphilis was held during the March meeting of the Albany County Medical Society Dr Paul Padget, assistant professor of medicine, Johns Hopkins University School of Medicine, and chief of the Medical Service, Veterans Hospital, Fort Howard, Maryland, was moderator of the discussion The panel of local doctors who aided Dr Padget consisted of Drs Filippone, Von Storch, Berg, Russo, and Brumfield

Broome County

The Broome County Medical Society, during the recent session of the State Legislature, called on county residents to oppose the Seelye-Coville Bill to license and legalize the practice of chiropractic Handbills and pamphlets on the subject were distributed throughout the county

Chemung County

Dr Stuart L Vaughan, assistant professor of medicine, University of Buffalo, School of Medicine, addressed a joint meeting of the County medical and dental societies on March 5 Dr Vaughan's subject was the hemorrhagic disorders

Clinton County

"The Diagnosis and Treatment of Tropical Discases in the Returning Veteran" was the subject of a postgraduate lecture given to members of the Clinton County Medical Society on March 28 Dr Harry Most, assistant professor of -medicine and preventive medicine at the New York University, College of Medicine, was the lecturer

Erie County

A broad survey by the New York State Department of Health of all tuberculosis hospitalization, diagnostic, and control facilities in Eric County, as urged by the County Medical Society, has been pledged by Dr Robert E Plunkett, assistant State commissioner of health for tuberculosis control The study is to be conducted in conjunction with the State Health Department's investigation of the physical plant of the J N Adam Memorial Hospital at Perrysburg

Working closely with the State Medical Society, the Eric County Medical Society aided in the defeat to the recent bills presented to the State Legislature to legalize the practice of chiropractic The March Bulletin of the Society states that Dr Werner J Rose, chairman of the Society's Commuttee on Legislation, and Harold P Jarvis, the Society's executive officer, were sent to Albany during the Session The Society also distributed to its members 25,000 copies of a circular urging physicians and friends to write or wire their local legislators protesting against passage of the bills Similar circulars were mailed to 300-odd Buffalo area pharmacists, to officers of the Eighth District Dental Society, and the superintendents of all Buffalo area hospitals

The annual Spring Clinical Day of the University of Buffalo Medical Alumni Association was held April 19 in the Hotel Statler—Heading the list of speakers was Dr Andrew C Ivy, professor of medicine, and vice-president of the University of Illinois, who went to Germany as a representative of the Government and the A M A to investigate medical atrocities—He spoke on "Nazi War Crimes of a Medical Nature"

Morning and afternoon sessions were held and five-year class reunions in the evening. During the program a plaque was dedicated, commemorating those University of Buffalo Medical School gradutes who ded during World West II.

ates who died during World War II
Other speakers of the day included Dr Newton
D Smith, of the Mayo Clinic, Minnesota, Dr
Claude S Beek, of Cleveland, Dr Charles A Janeway, of Boston, Dr John H Talbott, and Dr
John R. Paine, of the University of Buffalo

Franklin County

At the regular meeting of the Saranac Lake Medical Society of Franklin County held March 5, Dr George W Thorn presented a paper entitled, "Recent Advances in Hormone Therapy" Dr Thorn is the Hersey professor of the theory and practice of physics at Harvard Medical School, and physician-in-chief, Peter Bent Brigham Hospital, Boston.

Jefferson County

The County Medical Society has invited the Medical and Surgical Care, Inc., to expand its territory to include Jefferson County

Dr William J Ort professor of pediatrics at the University of Buffalo School of Medicine spoke to members of the County Society on April 10 at the Hotal Woodruff His subject was 'Modern Methods in the Provention and Troatment of Infectious Discasca.' This locture was one in a series of postgraduate instructions arranged by the Council Committee on Public Health and Education of the State Medical Society in cooperation with the State Department of Health

Lewis County

The County Medical Society and the Hospital staff held a joint lunchoon meeting at the Hospital on February 10 Judge Miller B Moran, a momber of the Hospital Board spoke and outlined some of the plans for the proposed hospital addition scheduled for ordetion next year

Livingston County

Dr Hugh Pfluke, of Rochoster addressed the Livingston County Medical Society on diabetes at the meeting of March 26

Monroe County

Dr Clarence P Thomas, Rochester physician, has been selected by the Rochester Academy of Medicine as the Albert David Kairer medalist for 1947, according to Dr Paul W Beaven, chairman of the Committee on Award. The medal will be presented at the annual meeting of the Academy in May *

What do doctors do in their spare time? If they have any that is.

From the articles entered in the doctors hobby show at the Rochester Academy of Medicine March 4 they do everything from making ship models to oll paintings

Some of the hobbles exhibited were a chest and a pair of bellows carved by Dr. Stearns S. Bullen chairman of the Museum Committee. Articles wrought from copper and costumo jewelry with sottings of highly polished cannel coal made by Dr. Bullen were also shown

Among those with an artistle bent are Dr J Craig Potter president of the Academy who showed some of his pen drawings Dr George E Sanders, figurines carved from wood Dr Albert R. McFarland, oil paintings Dr Leonard Jones, photographs Dr P Frederick Metildi three pictures Dr Henry B Crawford paintings and Dr Joseph Roby pictures made on a trip around the world

In the collectors' section, Dr Joseph R. Mayor oxhibited a part of his collection of old pintols accompanied by articles he has written about their history. Dr Joseph Loder his stork glasses and violla he made. Dr John A. Benjamin, rare books Dr Victor W Logan, Chinese cramics and bronces and Dr Michael H Durante, a collection of fish spears and native cestumes acquired while he was in service in the South Pacific.

The making of ship models is a popular postime among the hobbvists with examples shown by Dr Lloyd Allen Dr George Deun, and Dr C P Thomas who also displayed a reproduction of a

early American tip-up table.
Guest speaker at the moeting of the Academy which followed the hobby show at 8.30 PM was Dr John Ralson Williams former chairman of the

Academy's Museum Committee its past-president and a past recipient of the Albert David Kaiser modal, the highest honor the Academy can bestow on a member.*

Montgomery County

The new slate of officers of the County Medical Society for 1947 are as follows president Dr R. J Juchli vice-president, Dr R. M Wytrwal sec rotary Dr David Childs, and treasurer Dr M J Kinin

Nassau County

Dr Herman O Mosenthal professor of clinical modicine at New York Post-Graduate Medical School and Columbia University addressed the Nessau County Medical Society at a meeting on March 4 in the auditorium of the Nassaul Hospital, Minsola. Dr Mosenthals subject was insulin in the treatment of disbettes

This postgraduate instruction is presented as a joint endeavor between the Medical Society of the State of New York and the New York State Department of Health *

New York County

A round-table discussion on the subject "Psychosomatic Medicine—The Relation of Mental Illness to Bodily Ill Health 'was held at the March meeting of the Medical Society of the County of New York. Dr. Carl Binger was the moderator with the following participating in the discussion Dr. George Daniels, Dr. Bidney G. Margolin Dr. Thomas A. C. Ronnie, Dr. Harold G. Wolff, Dr. Leon J. Saul and Dr. Edward Weiss. The latter two were from Philadelphia.

Niagara County

The editor of the Journal of the American Medical Association, Dr. Morris Fishbein spoke at the dinner culminating Clinic Day of the Niagara Falls. Academy of Moducine, March 8, in the Hotel Niagara, Niagara Falls. Dr. Fishbein spoke on "The Riso and Fall of Charlatanism."

At the morning sessions Dr Walter F Kvale of the Mayo Clinic, Rochester Minnesota, discussed The Prevention of Vanous Thombosis and Pul monary Embolism and Dr John Romano prosessor of psychiatry and psychiatrist in-chief at the University of Rochester School of Medicine and Strong Memorial Hospital, spoke on The Diagnosas of Neucosas.

The afternoon session featured talks by Dr Gabriel Tucker professor of bronchosophagology University of Pennsylvania Graduato Medical School, and Dr Newlin Passon, professor of obstotries Hahnemann Medical College, Philadelphia. Dr Tucker discussed 'Obstructive Dyspnea and P Passon Extraporitoosal Cesarean Section.*

Oneida County

Dr E. Henry Keutmann discussed "Some Practical Considerations of Pituriary Adrens, and Gonad Interrelationship at a meeting of the Onelda County Medical Society on April 8 at the Broad acres Sanatorium Utica. Dr Keutmann is assistant professor of medicine, University of Rochester School of Medicine and Dentistry

Onondaga County

The scientific program of the April 1 meeting of the County Medical Society consisted of two talks on the subject of the Rh factor Dr Raymond J Pieri discussed "The Mother and the Rh Factor," and Dr Robert C Schwartz spoke on "The Baby and the Rh Factor, Exsanguination Transfusion The discussion was opened by Dr Brewster C Doust

Studies of carcinomas of the female pelvis since 1930 by members of the gynecology department, Syracuse Memorial Hospital, were discussed at a meeting of the Syracuse Academy of Medicine on April 15, at the University Club

Orange County

Dr William J Hicks, president of Orange County Medical Society, was host to twenty-four commit-tee chairmen at a dinner served at Orange Inn,

Goshen, on February 24

There was a general discussion of the future program of the Society for the year with particular emphasis on learning more about recent proposals for a County Health Department and a State-aid laboratory for Orange County

Queens County

The Medical Society of the County of Queens is sponsoring a cancer teaching day on Friday, May 16 The program is as follows 1 00-2 30 PM — 16 The program is as follows 1 00-2 30 PM—Clinical session at Queens General Hospital by Leonard B Goldman, MD, chief of Tumor Service, Queens General Hospital, 3 00 PM—"Gastro-intestinal Cancer," by Albert Andresen, MD professor of clinical medicine, Long Island Medical College, discussion to be opened by A X. Rossein, MD, 4 00 PM—"Recognition and Treatment of Pelvic Cancer," by Howard Taylor, MD, professor of gynecology, College of Physicians and Surgeons, Columbia University, discussion to be opened by Edward C Veprovsky, M.D, 8 30 PM—"Cancer Control in Sweden," by Sture Osterlind, MD, director of Cancer Research of the Swedish Nadirector of Cancer Research of the Swedish National Cancer Institute, 9 00 pm - "New Methods of Treatment in Leukemia, Hodgkin's Disease, and Lymphomata," by Lloyd Craver, M.D., chief of medical service, Memorial Hospital, discusemer of medical service, Memorial Hospital, discussion opened by Arthur A Fischl, M D, 10 00 PM—"Roentgenotherapy in Treatment of Cancer," by Maruice Lenz, M D, professor of chemical radiology, College of Physicians and Surgeons, Columbia University, discussion opened by Leonard B. Columbia University, discussion opened by Leonard B Goldman, M D

Members of the County Society were presented two lectures during the month of March The first, entitled "Early Diagnosis and Treatment of Cancer" was given by Dr Leonard Goldman, chief of the tumor service, Queens General Hospital The second was a panel discussion on "Infectious Diseases of Childhood" Participants were Dr Walter Steffen, consulting pediatrician, Flushing and Queens General hospitals, Dr Harold T Vogel, director of pediatrics Flushing Hospitals and et director of pediatrics, Flushing Hospital, and attending pediatrician, Queens General Hospital, Dr Meyeron Coe, attending pediatrician, Queens

General Hospital, Dr Henry A. Reisman, director of pediatrics, Queens General Hospital, clinical professor of pediatrics, New York Medical College, and attending pediatrician, Jamaica Hospital

Rensselaer County

Dr Konrad Birkhaug described the use of BCG in vaccination against tuberculosis at the March meeting of the County Medical Society He explained the operation of the vaccine and the means by which it sets up a resistance to the disease He emphasized that once tuberculosis has been established the vaccination is of no avail

Dr Francis Fagan presided over the business meeting which followed the address Resolutions of respect were passed in honor of Drs Miles A. Mc-Grane, James A Boland, and Michael DeLuca,

and Rubin Ryvkyn, who died recently

Dr Frederick N Marty, instructor in clinical medicine, Syracuse University, College of Medicine, presented a postgraduate lecture to members of the County Society at the Troy Club on April 8 His talk was entitled, "Plasma Therapy, Whole Blood Transfusion, and the Use of Blood Substitutes and Derivatives"

St Lawrence County

"Modern Mothods in the Prevention and Treat-ment of Infectious Diseases" was discussed on April 10 by Dr William J Orr when he spoke to members of the St Lawrence County Medical Society His talk was part of the postgraduate instruction arranged by the Council Committee on Public Health and Education of the State Medical Society with the cooperation of the State Department of Health Dr Orr is professor of pediatrics at the University of Buffalo, School of Medicine

Members of the St Lawrence County Medical Society are cooperating in Medical and Surgical Care Inc which has enjoyed more than 64 per cent increase in its enrollment in 1946, it was reported at its sixth annual meeting in Utica by Harold C Stephenson, managing director *

Schenectady County

A meeting of the County Medical Society was held at the Schenectady County Medical Society Library Room, Ellis Hospital, on April 1 Dr Maurice Bruger, associate clinical professor of medicine, chief of the Division of Pathological Chemistry of the New York Post-Graduate Medical School and Hospital, spoke on "Protein Metabolism and Its Relation to Surgical Risk."

Ulster County

"The Diagnosis and Treatment of Anemia" was the topic of a postgraduate lecture presented to the County Medical Society on April 17 by Dr Paul Reznikoff, of the New York Hospital Dr Reznikoff is also associate professor of clinical medicine at Cornell University Medical College

NECROLOGY

F Warner Bishop, M D 59 of New York City died on March 23 Since 1939 Dr Bushop had been senior attending physician and director of the medical division of the outpatient department at St Luke's Hospital, New York. In 1912 he received his medical degree from Columbia University College of Physicians and Surgeons. He joined the house staff of St Luke's Hospital in 1915 and was also in the house staff of Sloane Hospital for Women, New York City

Dr Bishop was president of the medical board at St. Luke s from 1936 to 1938. He also was an in structor in physiology and assistant in clinical medicane at the College of Physicians and Surgeons Columbia University He was a member of the American College of Physicians, a member of the American College of Physicians, a member of the American Board of Internal Medicine, the American Modical Association, the State and County medical Societies, the New York Cadomy of Medicine president of the New York Cilnical Society in 1942, president of the Hospital Graduates Club in 1941, a former president of the Society of the Alumni of St. Luke a Hospital and a member of the Alumni Association of Sloane Hospital Andre A Castaldi, M.D., of the Bronx, died on

March 27 He was 53 years old At the time of his death, he was a junior surgeon in the ear nose, and throat service department of the Bronx Eye and

Ear Infirmary

Dr Castaldi received his medical degree in 1922 from Eclectic Medical College and he was a member of the State and County medical

societies and the American Medical Association Frank Dildine M.D., of Port Jafferson, died on February 27 He was graduated from the University of Maryland School of Medicine in 1807 Dr. Dilding was a member of the American Medical Association, and the State and County medical

societies. He was 79 years old Charles B. Duffy, M.D., 76, of Parishville, died on February 17 He was graduated from the Uni versity of Vermont Medical School in 1896 Dr Duffy was a member of the State and County medical societies, and the American Medical Associ-

Burr E. Decker M.D., 80 of Bradford died on March 24 Dr Decker who was the health officer

of Bradford, was graduated from the University of Vermont Medical School in 1891 Jasper Lewett Garmany MD, 83 of New York City died on March 20 Dr. Garmany had been professor of clinical surgery at the New York University College of Medicine for twenty years He was graduated from Bellevue Medical College in 1882, and was a member of the Academy of Med icine and the Royal College of Surgeons

Frank Bert Rasbach, M.D., 80 of Buffalo died on February 23 Dr Rasbach was one of the ex amining physicians at the induction center in World War II. Graduated from Bellevue Hospital Medical School in 1891 he was a member of the State and County medical societies the American Medical Association, the Medical Union and was a former member of the Buffalo Academy of Medicane.

Guy Beckley Steams, M.D., 76 of New York City died on March 25

He received his medical degree in 1900 from the New York Homeopathic College Dr Steams was a

CORRESPONDENCE

To the Editor

On behalf of the Board of the Children's Welfare Federation of New York City, and especially the Committee on Mother's Milk, I want to express grateful appreciation for the fine editorial in the New York State Journal of Medicine of February 1, 1947 I believe that this should give more physicians the idea of urging mothers not only to

nurse their babies but to come to the Bureau to help other babies to survive

Thank you again, and with every good wish to

you in your fine work,

Sincerely,
(Signed) JULIA E SUITH
Acting Director

March 24 1947

"The Importance of the General Practitioner"

To The Editor

After reading the editorial in your March 1 issue on the Country Doctor, I was very much interested and pleased, as I spent some thirty-five years in that work, and, I want to say, the happiest days of my life Yet, I must also say, I had some very trying experiences, but during those trying experiences I learned something that gave me more courage and confidence in myself, for, as you all know, there is a first time to everything I was compelled to do things when I was not sure of the results, and I must say the results were very good The most important thing in the Country Doctor's training is to have a pretty good knowledge in all branches, for he never knows what he is going to run into the next day and it may make his heart beat faster if he doesn't know much about the case, with the family crying and looking on I am sure I didn't have any more training than required before I started out alone in a country village near the beautiful St Lawrence River There were no telephones, no telegraphs, only three mails a week, and no doctor within seven to fifteen miles, and one could not be sure they would help you much, for at that time there was a feeling of jealousy among them, and if one was called, you were not sure of a patient after he left. I know what I am talking about

Things have changed in the sixty years when I was

making up Seidlitz Powders, Condition Powders for horses, and Worm Powders for babies in a drug In six months I became quite familiar with all drugs and what they were used for I then took up a business college course Then I spent two summers with two of the best village doctors of the I also spent a summer in a women's hospital where I had a wonderful obstetric experience for which I was always very thankful, as my first two cases were serious complications which I was able to handle successfully Then, after two years in anatomy, two in surgery, two in materia medica therapeutics, and discuss of children with general medicine, I was given a diploma in medicine and one in surgery, and a permit to practice by Professor Austin Flint at Bellevue Hospital Medical College of New York City I then began to cope with everything that came along With a little reading and postgraduate work, I have tried to keep abreast of the times for nearly sixty years The young doctor of today who would follow my footsteps will know he has been places, and will do well in any country place, have many friends, and enjoy life

member of the American Homeopathic Society and the New York State Homeopathic Society

He was a lecturer on homeopathic materia medica and therapeutics from 1900 to 1915 at the New York Homeopathic College and Flower and Fifth Avenue Hospitals John H Trevaskis, M D, 34, of New York City, died on December 31 He received his medical degree from McGill University in 1939, and was a member of the State and County medical societies, the American Medical Association, and the American Psychiatric Association

HOSPITAL NEWS

Convalescent Care an Important Hospital Activity

DESCRIBING the convalescent patient of a few years ago as the "stepchild of medicine, the Hospital Council of Greater New York has outlined new concepts of convalescent care that are leading to quicker recovery from illness or injury and more continuous medical supervision. The Council dis-cussed, at its mosting on April first its Master Plan recommendations for the development of hospitals and related facilities in New York City The Council referred to military and civilian hospital experience that has tended to shorten the period of recovery

On the basis of a new concept of convalescent care. the Hospital Council recommends that facilities for the care of the convalescent patients be established

as units of general hospitals.

It pointed out that 'reports of surgical cases in civilian hospitals indicate that the incidence of postoperative pulmonary and circulatory complications is reduced that gastrointestinal function is more quickly restored and that wound healing is facili tated by getting patients out of bed within a day or so after operation.

Hodgkin's Disease Research Group Formed

FORMATION of a new medical research group The Hodgkin's Disease Research Foundation, was announced Varch 13 by Dr Antonio Rottino chief pathologist of New York's St. Vincent s Hos-pital and first vice-president of the Foundation

Dr Rottino stated that the organization has set itself a goal of two million dollars to be raised in 1947 This money will be used to carry on laboratory research and operate clinics for treat-ment of the disease.

Hospital Studies Needs of III Child

DESCRIBED as 'a long step forward in pediatric nursing, the first study of what makes good nursing care for children is now under way in the pediatric department of New York Hospital New York City

This six-month research project started December 2, 1946 is sponsored jointly by the United States Children's Bureau and the National League of Nursing Education, in cooperation with New York Hospital

A podiatrician with psychiatric training and a nursery school educator are among the consultants in this study to which Louise A. Flynn a specialist in pediatric nursing engaged by the Children's Bu roau has been assigned full time

Hospital staff members including pediatricians, nurses and an administrator also are assisting with the study, which is under the direction of Miss Blanche Pfefferkorn, director of studies, National League of Nursing Education

News Notes

Doctors and nurses are needed badly at the hospital for doubled votorans at Sampson it was revealed March 3 when the Veterans Administration, through its Symcuse regional office issued an urgent

appeal for personnel

"The hospital, recently acquired by the VA from the Navy needs 215 persons to care for war disabled patients, a publicity release stated.

Twenty-seven vacancies are open for doctors with malaries ranging from \$4 149 00 to \$9 975

Saturday March 1 the Chaffee Hospital, Spring ville opened after being closed for eight months. The hospital has been completely rebuilt using only the outside walls of the old Chaffee dwelling *

Patients in the enlarged North Country Community Hospital will have the advantage of a fine new library stocked with current and standard works through a subscription of \$5,000 to the build ing fund by the Glen Cove-Locust Valley unit of the American Women's Voluntary Service * The medical staff at St. Luke's Hospital, Utica has contributed enough to the St. Elizabeth Hos-

pital Building Fund to endow a single bedroom
The announcement was made by Dr. C. S. Dick
son president of the medical staff at St. Luke's, and Dr John F kelley in charge of staff solicitation for the building fund at St. Luke's Hospital The room will be known as the 'St Luke Room.

Although the amount contributed was not an nounced, officials previously had said \$4,200 was the approximate cost of endowing a single bedroom

On March 23 a dinner was tendered in honor of Dr William Klein on his twenty fifth anniversary as attending surgion at the Home and Hospital of the Daughters of Jacob

He was the organizer of the Surgical Division of the Hospital and has been at the head of it over since

With the staff back to a prewar level of 195 doctors, the outpatient department of the Long Island College Hospital has expanded its services by the addition of six new clinics, making a total of 3 clinics to which patients made 59,000 visits, according to the annual report of the department made public at the Hospital

The new clinics added to an already comprehensive program include special units for the treatment of arthritis, anemia, and other blood disease, adult endorme disturbances, nephritis, vascular disturbances, and chest diseases *

Herman Ringe, president of Wyckoff Heights Hospital, Long Island, revealed in March that with \$500,000 of the \$600,000 required by its building program raised, construction will begin soon on the new extension

The six-story, 150-bed wing in Stockholm Street will be used largely for maternity care, ringe said, adding that last year a record of 1,055 babies were born in the hospital *

To enable it to overcome the tremendous deficit caused by its patients who are unable to pay their bills, the Children's Hospital, Buffalo, has embarked on a drive for sustaining funds The hospital, its endowments depleted, takes care of all children, regardless of their ability to pay, but has reached the point where, for the first time in its history, it must appeal for assistance from the community

At the Helm

Dr Samuel Eli Reiter is the latest member to join the Sunmount Veterans Hospital medical staff

A native of Poland, Dr Reiter became an American citizen in 1930 He took his premedical courses at Columbia University and the College of the City of New York. He received his medical degree from Creighton University Medical School in Omaha, Nebraska, and served his internship in Harlem Hospital, New York City

During the war he served at Billings General Hospital and at Camp Carson, Colorado, before going overseas in May, 1944 Dr Reiter served in the CBI theater, spending much of his time in Burma He was later transferred to the Philippines and was en route there when the war ended *

Dr Alec Nicol Thomson, of Nassau Point, Peconic, has been appointed superintendent of the Eastern Long Island Hospital

Dr Thomson, a graduate of Long Island College Hospital, interned at the Bushwick Hospital, and was on the staff of the Swedish Hospital, specializing in surgery He was director of the Venercal Disease Clinic at the Brooklyn Hospital, served as director of medical work of the American Social Hygiene Association, director medical services, Committee for Dispensary Development, New York City, director medical activities, County of Kings, Brooklyn, and is a member of the County and State Medical Societies *

Dr Horace M Miller, of Utica, has been nominated by Governor Devey as a member of the Board of Visitors of Utica State Hospital for a full seven-year term to succeed Dr William M Martin, of Utica Dr Miller, a native of Willes-Barre, Pennsylvania, has been an osteopath in New York State since 1917 *

Improvements

The health and hospital board approved payment of \$570 for a new oxygen tent for Jamestown General Hospital at the February meeting. This is the This is the fifth oxygen tent purchased by the Hospital, but it is the first of a new iceless type, developed about three years ago, to be acquired *

The Masters and Past Masters Association of Richmond Masonic District have purchased equipment for Staten Island's three voluntary hospitals with funds gained from a \$10-a-plate dinner held by the association in January

The association has presented three heated bassinets and two incubator hoods each to Staten Island and Ruchmond Memorial hospitals, and a delivery table to St Vincent's Hospital for use in the maternity department *

Closed since the fall of 1944 because of a shortage of nurses, Pavilion F at Memorial Hospital, Ithaca, has been opened for the use of patients

This provides 11 private rooms and baths While that section of the hospital was closed, it underwent extensive improvements. New insulation was placed under the roof, new asphalt and tile floors were installed, the walls repainted, and new draperies have. draperies hung *

The United Societies of Mary Immaculate Hospital recently presented five wheelchairs to the hospital in Jamaica *

A second Rehabilitation Clinic for victims of infantile paralysis financed by the March of Dimes and the Buffalo and Eric County Chapter for Infantile Paralysis is now in operation at the Day School for Crippled Children at E J Meyer Memorial Hospital, Buffalo

When fully equipped, the new clinic will cost more than \$5,000 The Buffalo Chapter is also pay-

ing the salary of a physical therapist

Another rehabilitation clinic financed by the Buffalo and Eric County Chapter at a cost of approximately \$10,000 is located at the Children's Hospital

In the clinic at the Day School for Crippled Children, the chapter has already supplied a diathermy machine, infrared heat lamp, parallel bars, walking bars, large mirror, four treatment tables with pads to fit, six large walkers, six small walkers, bicycles, and treadways to aid in strengthening leg muscles of the young polio victims, stairs to train them to enter and depart from busses and street

cars, two gymnasium pads, doll carriage, educator type toys, and treatment table with arm abduction splints

More than 25 infantile paralysis victims attended the day school and are aided by the clime, it was pointed out by Miss Elizabeth I Leary, principal Other crippled children at the school also receive treatment at the climic There are 172 physically handicapped children enrolled in the school

The school has five Hubbard tanks and a swimming pool in which the polio victims and the other physically handicapped children receive treatment *

NEW LABORATORY ESTABLISHED FOR ROUTINE RH BLOOD TESTS

A new laboratory, the first of its kind, has been established in Baltimore to act as a clearing house for the widespread testing of the Rh factor in the blood, according to three investigators, writing in the December 21 issue of the Journal of the American Medical Association

The authors of the report are Milton S Sacks M D, director of the Baltimore Rh Typing Laboratory, Elsa F Jahn, and William J Kuhns, M S, from the Department of Clinical Pathology, the University of Maryland School of Medicine

The idea for the laboratory is credited to a number of obstetricians in Baltimore who deemed it essential to establish facilities for routine Rh studies at a minimal cost for any clinic or private patient in the city

The laboratory, which began to function on August 1, 1945, is under the jurisdiction of a committee of six members of the Obstetrical and Gynecological Section of the Baltimore City Medical Society. It is a privately sponsored, cooperative community venture. The services of the laboratory are offered free of charge to the dispensary patients of any hospital within the city and to patients of the City Health Department Obstetrical Clinics. Private patients pay \$3 or \$5, depending on the extent of services desired. "The initial charge is the only one," state the authors. "All subsequent studies throughout pregnancy are made without further cost.

to the patient. Similar arrangements have been made available to physicians in the counties of Maryland "

The authors state that "during the first eight months of its existence, the laboratory performed tests on approximately 7,000 pregnant women. There were approximately 12,000 births in Baltimore during a similar period."

Women patients who come to this laboratory are tested for sensitization to the Rh factor. That is, a test is made to determine whether there are antibodies in the blood against Rh positive blood cells. If there are, the patient might become ill from jaundice, Bright's disease, or anemia after transfusion of Rh positive blood. If the patient has not been sensitized, sensitization can be prevented.

"Of a group of 904 Rh-negative pregnant women, 46, or 5 08 per cent, displayed evidences of sensitization," according to the authors

Among the by-products of the operation of the laboratory the authors mention

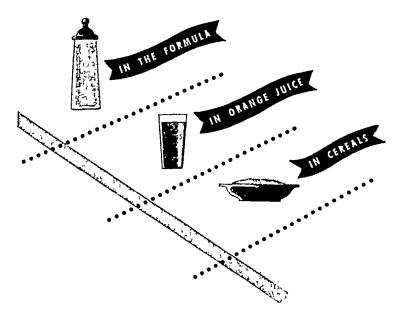

(1) the maintenance of a supply of blood serum from Rh-sensitized patients, (2) the accumulation of a large list, available to all hospitals in the city, of Rh-negative men of all blood groups who are willing to serve as volunteer or professional donors in an emergency, and (3) the application of Rh tests in medicolegal problems which involve disputed paternity

MEASLES EFFECTIVE IN COMBATING KIDNEY DISEASE IN CHILDREN

Measles may prove to be effective in combating nephrosis, a kidney disease sometimes found in children, according to Drs Richard W Blumberg and Harold A. Cassady, of Cincinnati

and Harold A. Cassady, of Cincinnati
Of five patients with kidney disease who
became infected with measles, they state,
the symptoms subsided in two while the
other three experienced temporary improvement of their nephrosis. The physicians,
who are from the Children's Hospital Research

Foundation and the Department of Pediatrics, University of Cincinnati College of Medicine, point out that infection with measles was more effective in causing abatement of the kidney disease than any other curative agent they used Writing in the American Journal of Diseases of Children, published by the American Medical Association, the authors also cite reports by other investigators which list four or five complete cures of the kidney ailment after infection with measles

6 Vitamins in easy-to-take form

When you prescribe Vi-Penta Drops, your patients receive a dependable source of generous amounts of vitamins A, B₁, B₂, C, D and niacinamide in a form that is easy to give and pleasant to take These clear non-alcoholic drops are freely miscible with milk formula, fruit juice soup, cereal, dessert and other foods. 15 and 30-cc vials and 60-cc packages HOFFMANN LA ROCHE INC ROCHE PARK NUTLEY 10 NEW JERSEY T M—VI Pents—Reg U S, Pat. Plans were announced for an essay contest on "Why Private Practice of Medicine Furnishes This Country with the Finest Medical Care," to be sponsored by the Medical Society and its Auxiliary Members of the contest committee are Dr Walter S McClellan, chairman, Dr Claire King Amyot, Dr Robert Hayden, Mrs John Esposito, and Mrs Robert Rockwell

St Lawrence County Committees were formed for setting up a constitution and bylaws at a recent meeting of the newly formed Auxiliary of the St Lawrence County Medical Society at the Crescent Hotel in Ogdensburg Mrs John J Free, president, presided, and twenty-four members attended

"This is the maiden all forlorn"

Far too often in the past, the secondary anemia case improved to a point below normal then stopped—
or showed very slow progress. Today thanks to the efforts of research workers at the University of
Wisconsin physicians are better prepared to treat such cases. The answer lies in the discovery by the
University group that maximum hemoglobin regeneration requires the presence of copper to act
as a catalyst for the iron. Cofron Elixir is based upon this discovery. It is a palatable liquid
containing one part copper to 25 parts iron, the ratio found most effective by the Wisconsin
investigators. In addition. Cofron Elixir contains liver concentrate as a source of vitamin B
complex factors. Cofron Elixir is offered for the treatment of nutritional and other
secondary anemias, and for general use as an iron tonic and hematinic in the treatment of
anemias accompanying prolonged illness. It is especially suitable for children and others
who prefer liquid to capsules. Cofron with Liver Concentrate in Capsules is designed
for the treatment of more severe secondary anemia. Cofron Elixir is available
for your prescribing convenience in 12-fluidounce and 1 gallon bottles. Cofron
with Liver Concentrate in Capsules is stocked at pharmacies in bottles. Office
with Liver Concentrate in Capsules. Stocked at pharmacies in bottles.

REVIEWED

The Physiological Basis of Medical Practice A University of Toronto Text in Applied Physiology By Charles Herbert Best, M D, and Norman Burke Taylor, M D Fourth edition Quarto of 1169 pages, illustrated Baltimore, Williams & Wilkins Company, 1945 Cloth, \$10

The fourth edition of "Best and Taylor" continues the encyclopedic tradition of its predecessors It is a one volume compilation of basic science (physiology, pharmacology and biochemistry) organized in relation to its application to clinical medicine. The format has been changed so as to economize on utilization of space, but other than this and the revisions necessary to bring it up to date,

there is little change from previous editions. The bibliographies are well chosen and the indexing is adequate

ARTHUR SHAPIRO

Aviation Neuro-Psychiatry By R. N Ironside, M.B (Aberd), and I R C Batchelor, M.B (Edin) Octavo of 167 pages Baltimore, Williams & Wilkins Company, 1945 Cloth, \$300

[Continued from page 1044]

Group Psychotherapy A Symposium Edited by Jacob L Moreno, M D Octavo of 305 pages Beacon, N Y, Beacon House, 1945 Cloth, \$500 Edited

This volume reveals the pioneer spade-work in the field of group psychotherapy, a term comed by Moreno in 1931 Herein one may taste the virgin interest experienced in 1932 at the round-table conference at the Philadelphia meeting of the American Psychiatric Association, presided over by the late Dr William A White The papers presented at this conference and also those at the 1944 conference indicate a definite growth in the need, interest, and development of various technics which group psychotherapy has utilized since the early days of Moreno, of Beacon, New York, and Pratt, of Boston, who spear-headed this significant trend to psycotherapy This method of treatment has unique contributions to make to the group, as well as to the ındıvıdual patient

Realizing the dearth of psychiatric personnel and inherent advantages of group psychotherapy per se, the critical and progressive worker in the field of psychiatry will become well versed with this stepping-stone in the development of what promises to be a growing and accepted component of psychiatric

methodology

FREDRICK L PATRY

How a Baby Grows Arnold Gesell, M D A Story in Pictures Arnold Gesell, M.D. Quarto of 81 pages, illustrated New York, Harper & Brothers, 1945 Cloth, \$2 00

This book, with its total of some 800 photographs, is most revealing in context. The pictures reiterate constantly that growth can be guided most successfully if the inborn characteristics and the maturity of the child are taken into account Parents are reminded that the growing child is a distinct individual with a personality all his own This book will be of extreme value as a guide to parents as well as medical men

MARK J WALLFIELD

Neurosyphilis By H Houston Merritt, M D, Raymond D Adams, M D, and Harry C Solomon, M D Octavo of 443 pages, illustrated New York, Oxford University Press, 1946 Cloth, \$11

The clinical and pathologic material presented in this book has been obtained mainly from the Neuro-syphilis Clinic and Neurological Unit of the Boston City Hospital, and from the Neurosyphilis Clinic and wards of the Boston Psychopathic Hospital

It is an orderly and systematic presentation of the subject, covering every aspect of neurosyphilis Well-organized, carefully outlined, and clearly presented, it offers a thorough exposition of the neuropathology, clinical symptomatology, and methods of treatment

A monumental work that will rank high among the best textbooks of its day, it is highly recommended to all medical men, and is an indispensable book for the neurologist, psychiatrist, and syphilolo-

gist

Glaster, M.D. Eighth edition Octavo of 691 pages, illustrated Baltimore. Williams & W. Company 1977 Cloth, \$8 00 Company, 1945

The eighth edition of this excellent book surpasses earlier editions by its inclusion of a considerable amount of new material, and for the first time stresses natural color illustrations

Included in the new matter are such subjects as the proposed social insurance system, M and N

factors, and the Rh factor in the blood

The general practitioner will find in this book a valuable aid when confronted with medicolegal problems

S INGRAM HYRKIN

Topley and Wilson's Principles of Bacteriology and Immunity, Revised by G S Wilson, M D, and A A. Miles, M A (Eng.) Third edition In Two Volumes Octavo of 2,054 pages, illustrated Baltanary more, Williams & Wilkins Company, 1946 Cloth,

Professor A A Miles, professor of bacteriology of the University of London, collaborated with Professor Wilson in writing the third edition of this worldfamous text Professor Topley died in 1944 and Dr Miles replaced him

The book is an encyclopedia of bacteriology New chapters on chemotherapy and the bacteriology of

air have been added

No other text dealing with bacteriology remotely approaches this one for completeness and the excellence of presentation All who are interested in bacteriology should have access to this admirable edition

MORRIS L RAKIETEN

Clinical Neurology By Bernard J Alpers, M D Quarto of 797 pages, illustrated F A Davis Co, 1945 Cloth, \$8 00 Philadelphia,

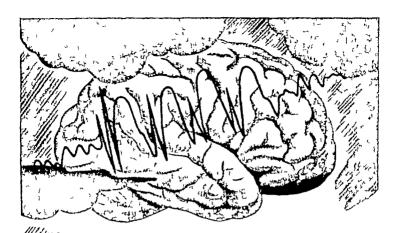

An inviting format and a clear style of conversational quality make this richly informative text good reading for medical students and general practi-tioners, as well as for neurologists. The sections dealing with pathology, differential diagnosis, and treatment are unusually full and helpful Many diagnosis. grams are new, more illustrations are warranted. The author's style, plan, and experience encourage concrete thinking in the construction of neurologic diagnoses

ALICE B CAMPBELL

Principles of Roentgenological Interpretation By L R Sante, M D Sixth edition Quarto of Sixth edition Quarto of Ann Arbor, Edwards 356 pages, illustrated Brothers, 1945 Cloth, \$3 50

Because of the ever-widening field of roentgen diagnosis medical schools pay increasing attention to the teaching of this specialty Instructors and students alike will find Sante's book a most useful text

Concerning the amount of space to be allotted to the different subjects, no two teachers will agree in every detail The author attempts to overcome this difficulty by having unusual subjects printed in smaller type If the reviewer may utter a word of constructive criticism for future editions The most frequent bone tumor and metastatic malignant new growth of the bone might be dealt with a little more

BRAIN STORM

The encephalographic tracing of a typical epileptic seizure with its large widely spaced waves resembles a gale swept sea. By calming the cortical storm without producing noticeable drowsiness, Mebaral makes the lot of the epileptic much more tolerable. The average dose for adults is from 3 to 6 grains daily for children from ½ to 3 grains daily. Tablets 0.03 Gm (½ grain) 0.1 Gm (1½ grains) and 0.2 Gm. (3 grains).

Mebaral may also be administered in combination with Luminal or diphenylhydantoin sodium

Write for detailed information

THOP CHEMICAL GOMPANY, IN

[Continued from page 1046]

broadly Pregnancy roentgenography certainly deserves more space than two thirds of one page out of 337

The information contained in the book is critical, authentic, and-it should be emphasized-up to It is presented in a language easily understandable to the novice Many drawings and diagrams and a fair number of good halftone illustrations enrich the text

S W Westing

Peptic Ulcer Its Diagnosis and Treatment. By I W Held, M D, and A. Allen Goldbloom, M D Octavo of 382 pages, illustrated Springfield, Illinois, Charles C Thomas, 1946 Cloth, \$6 50

The object of the authors of this volume has been admirably achieved, namely, "to stress the diagnostic and therapeutic aspects of this disease (peptic ulcer) in order to meet the demands of the busy practitioner, the doctor in military service, and the medical student" The monograph is divided into two sections Part 1 Simple Peptic Ulcer, Part 2 Peptic Ulcer with Complications The wealth of experience of the authors is evident in the rich descriptions of the differential diagnosis of ulcer and its complications in all the variety presented at the bedside There is of necessity some repetition, both of differential diagnosis and of therapy, in the two parts of the monograph On the whole, the volume is a very readable reference for diagnosis and treatment of peptic ulcer

MAURICE TULIN

Synopsis of Obstetrics and Gynecology Aleck W Bourne, MB, (Eng) Ninth edition Duodecimo of 500 pages, illustrated Baltimore, Williams & Wilkins Company, 1945 Cloth, \$5 00

That this little book is now in the ninth edition is proof of its popularity The basal facts of obstetrics and gynecology are concisely presented in synopsis form In no sense a textbook, it does answer questions quickly, as it is primarily designed to prepare students for examinations

CHARLES A. GORDON

War Neuroses By Roy R Grinker, Lt Col, (MC), and John P Spiegel, Maj, (MC), Army Air Forces Octavo of 145 pages Philadelphia, Blakiston Co, 1945 Cloth, \$2.75

This book by two of America's foremost neuropsychiatrists is the account of personal experiences with hundreds of patients suffering from acute war neuroses. It is the record of trained, experienced, and progressive leaders in the field. They divide the cases into nine groups, and classify them according to the chief symptoms in the following manner Free-floating anxiety states, severe and mild, 2 Somatic regressions, 3 Psychosomatic visceral disturbances, 4 Conversion states, 5 Depressed states, 6 Concussion states, 7 Exhaustion states, 8 Psychotic states, and 9 Malingering They give illustrates trations of each group, and describe the method of The book is an excellent presentation of treatment the subject, and contains most precious information regarding its various aspects. It is a fundamental and most valuable work that deserves all the praise that may be given it. It is highly recommended as an authoritative, accurate, and scientific presentation of war neuroses

Through the Stratosphere The Human Factor in Aviation By Maxine Davis Octavo of 253 pages New York, Macmillan Co, 1946 Cloth, \$2 75

Miss Davis' aim is to visualize the typical air crew member and his experiences from the time of his enlistment until his separation from the Army Air Forces and his rehabilitation to private life To use her own words, it is "a medical narrative—a story of aviation medicine"

This book is obviously the work of a lively writer as it has the freshness and vigor which come from enthusiasm and the intellectual mastery of the sub-In describing the Army Air Forces medical service, she has briefly and in an entertaining manner covered such subjects as the psychologic and physical methods by which the various crew members are selected for their particular assignments and their medical supervision thereafter by the flight surgeon, also, the effects of anovia and cold at high altitudes, and the means used to combat their effects, and, the care of the fighter pilot and the methods used to overcome the effects of centripedal acceleration upon the pilot, thus making him more efficient than his enemy

The book is an interesting picture of aviation medicine and is written in a style that will make it interesting to the lay person as well as to medical

FRANCIS N KIMBALL

Suggestion and Hypnosis Made Practical How to Get What You Want By Samuel Kahn, M D Duodecimo of 200 pages Boston, Meador Publishıng Co, 1945 Cloth, \$3 00

This small volume contains a considerable amount of material tracing the history and use of

suggestion from ancient to modern times

The varieties of suggestion and their importance in influencing human conduct are clearly and in-terestingly presented. The practice of hypnotism is dealt with at length

However, on account of a lack of clinical data the book will be of greater benefit to the layman than to

the specialist

ARTHUR J LAPOVSKY

Men Without Guns By DoWitt Mackenzie Descriptive captions by Maj Clarence Worden (Medical Department of the United States Army) Folio of 152 pages Illustrated with 137 plates from the Abbott Collection of Paintings Philadelphia, Blakiston Company, 1945 Cloth, \$500

Truly a magnificient accomplishment! It is a type of publication physicians who served in the armed forces would like to possess as genuine living history To all those not active participants in the war no more grim reminder of the horrors of total war could possibly be found than depicted in this collection of remarkably realistic puntings

The reviewer has read no better descriptive writing of the war than that found in the 47 written pages of the actual experiences of these artists equally skillful

with pen and brush

To the historically minded physician this unusual volume is a valuable commentary on medical progress and the contributions made by physicians and their coworkers in World War II

GOLD PHARMACAL CO., NEW YORK CITY

[Continued from page 1048]

The Chemical Formulary A Collection of Valuable, Timely, Practical Commercial Formulae and Recipes for Making Thousands of Products in Many Fields of Industry Edited by H Bennett Volume VII Octavo of 474 pages Brooklyn, Chemical Publishing Co., 1945 Cloth, \$6.00

The Chemical Formulary consists of formulae for cosmetics, pharmaceuticals, polishes, cleaners, lubricants, adhesives, inks, and scores of other products More than 2,000 formulae for mixing and making thousands of products are included. These are of no value or interest to the physician. The book was written especially for experienced chemists and technicians.

CHARLES SOLOMON

Our Inner Conflicts A Constructive Theory of Neurosis By Karen Horney, M D Duodecimo of 250 pages New York, W W Norton & Co, 1945 Cloth, \$3 00

This is the latest of a series of books by the author which further elucidates her concept of the neuroses. Her own divergence from the Freudian concept of the neuroses is reiterated and again stressed. However, the book gains rather than loses by the ensuing discussion.

The author's manner of presenting her material is clear and readable. The book is primarily intended for those who already have some knowledge of the neuroses and, as such, it is a welcome addition to psychiatric literature.

JOSEPH L ABRAMSON

Clinical Laboratory Diagnosis By Samuel A Levinson, M D, and Robert P MacFate, Ph D Third edition Octavo of 971 pages, illustrated Philadelphia, Lea & Febiger, 1946 Cloth, \$10

This edition of a standard text on clinical pathology is to be recommended because of the clarity and brevity in presenting the technical procedures, all of which have been brought up to date. Of particular value is a complete list of diseases and tests appropriate for their diagnosis. Page references are given to simplify such investigations. This makes the book of value not only to clinical pathologists and technicians but also to practicing physicians as a reference book.

LEO M MEYER

A Textbook of Pharmacognosy By George Edward Trease, Ph C Fourth edition, revised with the assistance of H E Street, Ph C, and E O'F Walsh, Ph C With contributions by R Bienfang, MS, et al Octavo of 799 pages, illustrated Baltimore, Williams & Wilkins Company, 1945 Cloth, \$7 50

Pharmacognosy deals with the physical and chemical characteristics of crude drugs. It treats also of their source and preparations. Physicians have no special interest in the cultivation of medicinal plants, the collection, drying and storage of drugs, extraction of drugs, etc. This book was written for students preparing for pharmaceutic examinations. It can be used, however, as a reference by those desiring some information on the origin and structure of drugs.

CHARLES SOLOMON

The Biology of Schizophrenia By R G Hoskins, M D Large Duodecimo of 191 pages New York, W W Norton & Co, 1946 Cloth, \$2.75 The book is a slightly enlarged version of the three lectures given at the New York Academy of Medicine in 1945, as the annual Salmon Memorial lectures. Dr. Hoskins approaches the subject from the biologic viewpoint, and regards schizophrenia as a manifestation of disordered biology. The approach is indeed quite new as far as the psychiatrist and general medical practitioner are concerned. It, therefore, affords a new approach to the understanding of the nature of this most dreaded disease.

ing of the nature of this most dreaded disease

The average physician, and the psychiatrist as well, will find the book a rather unusual and somewhat difficult, yet interesting, exposition of the subject. It will prove rather hard reading, though profitable in the long run. The book is a highly scientific and biologic presentation of a subject that has occupied the attention of psychiatrists since time immemorial. It is an interesting book, that will find a wide circle of readers.

IRVING J SANDS

IN Y State J M

Human Embryology By Bradley M Patten, Ph D Quarto of 776 pages, illustrated Philadelphia, Blakiston Company, 1946 Cloth, \$7.00

This current, authoritative volume is truly a work of art in many respects. More than 1,000 illustrations (53 in color) clarify the text to a degree where the subjects of embryology "and the correlated changes in the reproductive organs of the mother," become truly fascinating. The author has reached his objective of presenting developmental processes "not as a sories of still pictures of selected stages but as a story of dynamic events with the emphasis on their sequence and significance."

Invaluable features in the book are the lucid descriptions of functional correlations, the high excellence of the illustrations and their reproduction on "coated stock," and the complete index. It is a work which belongs in the library of every medical student and physician

ALFRED H IASON

The Management of Fractures, Dislocations, and Sprains By John Albert Key, M D, and H Earle Conwell Fourth edition Quarto of 1,322 pages, illustrated St Louis, C V Mosby Co, 1946 Cloth, \$12.50

This excellent work is now in its fourth edition All phases of the subject are comprehensively considered. The changes include revisions of the sections on the spine, the hip, and on compound fractures. Lessons learned from the treatment of the wounded during the war are incorporated. The illustrations are profuse and well selected. Many new ones have been added.

The volume is strongly recommended to anyone who treats fractures

MAYER E Ross

Ophthalmology in the War Years Edited by Meyer Wiener, M D V I (1940-1943) Octavo of 1,166 pages Chicago, Year Book Publishers, 1946 Cloth, \$13.50

This book is a descriptive index medicus of numerous articles on ophthalmology between 1940 and 1943. When one considers that most of the articles were conceived and prepared well before the war, the title War Ophthalmology might mislead the practitioner who would prefer to think of this subject as past history. As a reference book it should prove indispensable because the reader has at his command a sequential résumé of all articles published in available journals. More of this series published in regular sequence over five-year periods should prove valuable.

SUGGESTIONS FOR CONTRIBUTORS TO THE NEW YORK STATE IOURNAL OF MEDICINE

The New York State Journal of Medicine asks its contributors to follow the suggestions listed below in the preparation of their articles way they will greatly facilitate the expeditious publication of the JOURNAL These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles —It is earnestly desired that scientific articles shall not exceed 6 JOURNAL pages at the outside Longer articles tend to lower reader interest An average of five or six seems to be the most desirable from this point of view culation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e g, twelve manuscript pages will make five Journal pages

Manuscripts —Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins They should be prepared with great care so as to be typographically correct All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin This is imperative for rapid and accurate composition by the printers

Titles —The title should be brief and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives Directly under his name should be the hospital or institution with which he is affiliated

Subheadings —Subheadings serted by the author at appropriate intervals

References -It is the unfailing practice of the NEW YORK STATE JOURNAL OF MEDICINE to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text) The arrangement should be as follows and should include all items

Books—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed., Philadelphia, Lea & Febiger, 1927, vol 5, p 57

Periodicals—author's surname followed by

initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

Note The JOURNAL does not include titles of articles

Case Reports -Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables —While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page. For that reason it is urged that they be reduced as much as possible to descriptive language

Illustrations —These should be kept to the minimum necessary to make clear the points to be registered by the author. In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space and the not inconsiderable cost

When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India ink on white paper Do not use typewriter for lettering The smallest lettering on 8 × 10 inch copy should be no less than 1/4 inch high Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable after reduction Mail rolled or flat, never fold Photographs should be very distinct and show clear black and white contrasts They must be on glossy white paper Avoid round and oval photographs Whenever possible "crop" photographs, 1e, mark portion that can be excluded when reproduced Crop marks should be on margin of photographs.

Do not run pencil lines through photographs graphs

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

STUBBORN CASES CALL FOR...

Phosphaljel

Phosphaljel is unexcelled in the treatment of marginal ulcer. It provides quick relief from pain

lays a protective coating over the inflamed mucosa safely buffers gastric acidity with no danger of alkalosis or "acid rebound" Phosphaljel permits a liberal bland diet—patients are more contented during treatment, gain strength and weight more quickly

Phosphaljel provides excellent prophylaxis against seasonal recurrences, as well as protection against marginal ulcer following surgery It is highly valuable in cases complicated by diarrhea, pancreatic insufficiency or phos phorus deficiency, and is well adapted for continuous buffering by intragastric drip

4 4 4

A new Wyeth motion picture, in full color, entitled "Intragastric Drip Therapy for Peptic Ulcer," illustrating the use and advantages of the intragastric drip apparatus, is now available to medical groups Request a showing for your medical society Address Professional Service Department

Experience is the Best Teacher

Claude Bernard (1813-1878)

proved it in glycogen research

Bernard believed in planned experimentation. He showed this in his study of the pancreas and in his experiments proving the manu facture and secretion of gly cogen by the liver This hasic work paved the way for hormone research. Later he established the funda mental facts of vasomotor physiology Bernard knew the value of experience—yes, experience is the best teacher!

THAT wartume cigarette shortage was a real experience to smokers Millions of people smoked more different brands than they would normally try in a lifetime. And out of the comparisons of that experience so many more smokers came to prefer Camels that today more people are smoking Camels than ever before.

We don t tamper with Camel quality Only choice tobaccos, properly aged, and blended in the time-honored Camel way, are used in Camels.

According to a recent Nationwide survey

More Doctors smoke Camels

R. I. Reynalds Tobarco Ca., Winston-Salem, N. C.

than any other cigarette

pH VALUE The normal vaginal pH lies between 40 and 50 Both Lactikol Jelly (pH 415) and Lactikol Creme (pH 49) are within this normal range and so tend to maintain the proper pH value of the vaginal tissues

SPERMICIDAL POWER Both Lactikol Jelly and Lactikol Creme immobilize sperm instantly on contact

VISCOSITY The viscosity of Lactikol Jelly and Lactikol Creme is carefully controlled so as to maintain a suitable barrier action and avoid unaesthetic leakage in use

LUBRICITY Lactikal Jelly with a vegetable gum base,

provides a highly lubricating medium Lactikol Creme with a cream base, is less lubricating The choice be tween these lies with the preference of the patient

STABILITY Both Lactikal Jelly and Lactikal Creme re main stable for several years and can withstand extreme variations in atmospheric temperature

ACTIVE INGREDIENTS Lactical Jelly: Lactic Acid, 1.5%; Glyceryl Monoricinoleate, 1 0%; Sodium Lauryl Sulfate, 0 2%; Oxyquinoline Sulfate, 0 05%

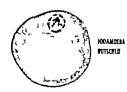

Lactikal Creme: Lactic Acid, 0.5%; Glyceryl Mono ricinoleate, 1.5%; Sodium Lauryl Sulfate, 0.6%

ENDAMOTEA COLF

"' most of the patients with amoebic infection of the large bowel present a picture which resembles any ohronic low-grade infectious colitis ''

> ---Lopex Portes, J. P.; Am. J. Digest. Dis. 12 137 (April) 1945.

The difficulty of diagnosing amebiasis and the importance of stool examination on several successive days have been stressed by many clinicians

When amebiasis is suspected, either in its acute or latent form, Diodoquin may be employed as an effective amebicide

Diodoquin is tasteless, relatively nontoxic of high protozoacidal potency does not produce unpleasant purgation and may be administered in large doses over prolonged periods

Diodoquin is the registered trodemark of G. D. Soarie & Co. Chicago 80, Illinois

DIODOQUIN (5,7-dliodo-8-hydroxyquinoline)

now council accepted!

The action of Mesopin is especially directed toward the gastrointestinal tract. This selective action provides prompt relief in many commonly encountered digestive disturbances and mini x3 mizes unwanted effects on widely separated and unrelated parts of the body Mesopin permits specific management of hyperactivity and spar ticity in the stomach and intestines without caus ing the undestrable effects of atropine

Mesopin is available on prescription in both of 100 tablets each tablet containing 2.5 mg (1/24 gr) homatropine methyl bromide

ENDO PRODUCTS INC . RICHMOND HILL 18

If you can picture in your minds eye a two-mile column of R-39 Units, placed end to end, you'll have a good idea of the popularity of this particular model, and the vast amount of diagnostic service it is rendering daily in the offices of specialists, and in clinics and hospitals everywhere

Why the R 39 s great popularity?

- I it is an all round diagnostic unit, yet is so compactly designed that it can be accommodated in a small floor space
- 2 Has ample power (100 ma and 85 kvp) for general radiographic and fluoroscopic diag nosis
- 3 Its unusual flexibility facilitates positioning of the patient vertically, angularly, or hori zontally
- 4 Its double focus genuine Coolidge tube serves both over and under the table
- 5 The simple to-operate refined control system assures a consistently fine quality of work

You, too may find the Model R 39 ideally adapt able to your particular needs. Why not investigate, by writing today for complete information. Address Dept. 2616. General Electric X Ray Corporation, 175. W. Jackson Blvd., Chicago 4, Ill.

GENERAL ELECTRIC X-RAY CORPORATION

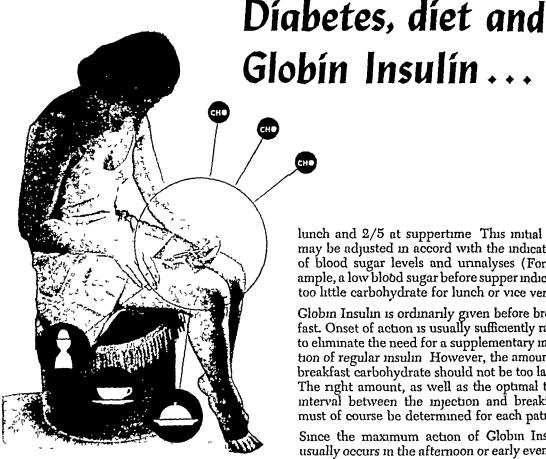

Modern estrogenic therapy takes a leaf from Nature's book. The gauge is simple, physiologic replacement. Unnaturally large doses are avoided. "The object is to use the minimum dosage at the long est possible intervals compatible with control of symptoms." Because Amniotin is available in a wide range of forms and

potencies, it is admirably suited—and widely used—for carrying out this rational therapeutic program. A natural estrogenic complex with a background of over seven teen years of clinical use. Amniotin offers the additional advantages of known safety and known effectiveness. It is highly purified, standardized in International Units.

SQUIBB

Aminiotin

lunch and 2/5 at suppertime This initial diet may be adjusted in accord with the indications of blood sugar levels and unnalyses (For example, a low blood sugar before supper indicates too little carbohydrate for lunch or vice versa)

Globin Insulin is ordinarily given before breakfast. Onset of action is usually sufficiently rapid to eliminate the need for a supplementary injection of regular insulin However, the amount of breakfast carbohydrate should not be too large The right amount, as well as the optimal time interval between the injection and breakfast, must of course be determined for each patient

Since the maximum action of Globin Insulin usually occurs in the afternoon or early evening, hypoglycemia is sometimes noted at this time As a guard against it, the carbohydrate content of the noon meal may be increased, or a midafternoon lunch provided Thus the original distribution of 1/5, 2/5 and 2/5 might, for example, require adjustment to 2/10, 5/10 and 3/10 or to 2/10, 4/10, 1/10 and 3/10 Once the balance of carbohydrate intake and insulin timing has been established, the patient must be impressed with the importance of adhering to the regimen

'Wellcome' Globin Insulin with Zinc is a clear solution, comparable to regular insulin in its freedom from allergenic properties Available in 40 and 80 units per cc, vials of 10 cc Accepted by the Council on Pharmacy and Chemistry, American Medical Association Developed in The Wellcome Research Laboratories, Tuckahoe, New York US Patent No 2,161,198 LITERATURE ON REQUEST

'Wellcome' Trademark Registered

THE ADVANTAGES of one-injection control of diabetes can, through adjustment of diet and dosage, be made available to the majority of patients requiring insulin In view of the convenience and freedom afforded by the unique intermediate action of Wellcome' Globin Insulin with Zinc, the necessary adjustment is well worth while Though not a complicated procedure, the regulation of carbohydrate balance warrants reiteration because of its importance

some facts about dietary adjustment: The distribution of carbohydrate in the meals must be adjusted in accord with the type of action exhibited by Globin Insulin, which is intermediate between regular and protamine zinc insulin Proper carbohydrate distribution with proper insulin timing is essential, lack of balance may lead to poor control or to an erroneous impression of the characteristics of Globin Insulin

A good carbohydrate distribution for the patient on Globin Insulin is to divide the total carbohydrate per day into 1/5 at breakfast, 2/5 at

BURROUGHS WELLCOME & CO (USA) INC, 9 & II EAST 41ST STREET, NEW YORK 17, N &

ADOLF KUSSMAUL, 1822-1902

Pioneer Investigator in Castroscopy

THE HISTORY of gastroscopy began with Adolf Kussmaul's rigid gastroscopes inspired by the sword swallowers seen at fairs throughout Europe and led the way to the first successful gastroscope of Mikulez in 1881 and to the development of such modern practical instruments as the

Schindler and the Hardt gastroscopes. Educated at Heidelberg, Kussmaul developed much apparatus in internal therapeutics and contributed vastly to the direct diagnosis of organic gastric disease. The use of the stomach pump was introduced by this brilliant and industrious investigator in 1867.

THE TACILITIES and effort of the Horro or Loboratory. Inc. are pledged to service of the ailied professions of medicine and pharmacy and the best interests of public health

PENDARVON

(a source of Amino Acids and Vita mins of the B Complex) answers the question of palatability with a zesty, heartening bouillon taste that is very appetizing

Pendarvon is NEW Let us send you a trial supply for tastetesting

8-oz bottles Granule-form, dissolves readily

SYSTEMIC REHABILITATION

Renewed pleasure in routine activities

The abolition of pain and restoration of function, the primary goal in all antiarthritic therapy is now possible even in advanced stages of chronic arthritis with the new therapeutic approach—a complete systemic rehabilitation program

Darthronol has been shown to be an integral part of such a program Through the combined pharmacodynamic and nutritional effects of nine active constituents, Darthronol exerts a beneficial ef fect in arthritis not only because of its high potency vitamin D but also because of the important role it plays in restoring optimal nutritional states and general well being Such a program of general rehabilitation tends to abolish pain and makes for renewed pleasure in performing daily activities

EACH CAPSULE CONTAINS:

Vitamin D (Irradiated 50,000 U 5 P Units Ergosterol) 5 000 U.S P Units Vitamin A (Fish-Liver Oil) 75 ma. Ascorbic Acid 3 mg Thiamine Hydrochloride Riboflavin 2 ma 0.3 mg Pyridoxine Hydrochloride I mg Calcium Pantothenate 15 mg Niacinamide 4 mg Mixed Tocopherols (Equivalent to 3 mg of synthetic Alpha Tocopherols)

DARTHRONOL

For the Arthritic

FIGURE 1 — Patient — thin type of build with beginning faulty body mechanics. The Camp adjustment provides a more stable polvis, allowing patient to "draw in" the abdominal muscles thus gradually acquiring a gentle lumbar curve.

FIGURE 2—Patient—intermediate type of build Strain of lumbos acral joint predisposes to other strains. For protection of the joints in the lumbar region from recurrent strain and also as an aid in relieving the pale of acute conditions, Camp lumbos acral supports have proved effective.

In the Conservative Treatment of The Lumbosacral and Lower Lumbar Regions

CAMP SUPPORTS offer advantages

- •••Give firm support to the low back, the support is easily intensified by re-inforcement with phable steels or the Camp Spinal Brace
- ••••Afford a more stable pelvis to receive the superincumbent load.
- ••••Allow freedom for contraction of abdominal muscles under the support in instances of increased lumbar curve (fig 1)
- ••••Are removed easily for prescribed exercises and other physical procedures prescribed by physiatrist or physician

S H CAMP AND COMPANY • JACKSON, MICHIGAN

World's Largest Manufacturers of Scientific Supports
Offices in New York • Chicago • Windsor, Ontario • London, England

The very state of nervous ten sion, litters and sleepless ness, which calls for safe, symptom free sedation, 1s also apt to make the patient captious, rebellious to medication

Elixir Buttsol Sodium proves gratifyingly useful at such times Its fresh green color, palatability and appealing fla vor help to convince the patient that something different is being done for him.

ADVANTAGES

- Intermediate derutión—5 to 6 hours
- Therapeutically effective in small dosage
- Low toxicity—wide margin of safety
- Inactivated in body independent of renal excretion.
- Onset of initial effects prempt and smooth.
- Provides refreshing sleep—no lethorgy or duliness on awakening.

INDICATIONS

Day-time sedation Menopausal hysteria Insomnia Neuroses

Preoperative tension and apprehension

Obstetrical hypnosis

8 OUT OF 9 MIGRAINE PATIENTS COMPLETELY RELIEVED BY NAOTIN

(75% success in all lypes of headache treated)

A recent report! on the treatment of 100 cases of severe headache, including migraine, emphasizes the clinical value of NAOTIN* Closely following the characteristic flush and heat sensation due to the peripheral dilatation produced by a 100 mg dose, given intravenously, complete relief of headache was achieved in 75 cases, and partial relief in all but three of the remaining 25 cases

In other types of headache, as well, the authors obtained "excellent results" with NAOTIN All 13 patients with post-spinal-tap headaches were completely relieved, as were 42 out of a

group of 57 idiopathic cephalalgias Side effects were minimal and infrequent, and recurrences were noted in only 22 patients

A clinical trial will prove the value of NAOTIN in your own practice For further detailed information, write to the Medical Service Department, The Drug Products Co, Inc, Passaic, New Jersey 1 Goldzieher and Pookin, J.A.M.A. 131 103 1946

This drying oven at Carnation's central laboratory checks the solids in Carnation Evaporated Milk—for uniformity Every Carnation evaporating plant has its own laboratory, but the central laboratory tests samples regularly submitted by all plants—not only for total solids, but also for butterfat, curd tension, and viscosity There is a national quality standard for Carnation Milk—a standard strictly upheld from state to state, from season to season That assurance of uniform composition further reinforces the medical profession's unqualified acceptance of this respected brand

HEAT-REFINED—torning hine soft flocculent low tension curds

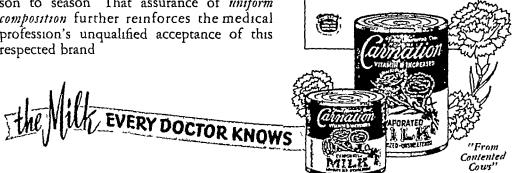

HOMOGENIZED—with butterfat minutely subdivided for easy assimilation

FORTIFIED—containing pure vitamin D₃ 400 U S.P units per pint.

STANDARDIZED—for uniformity in fat and total solids content

STERILIZED—after hermetic sealing

STERILIZED—after hermetic sealing insuring bacteria free safety and markedly diminished allergenic properties

Take time by the forelock.

That's the advice of those who save many valuable minutes each day with this eminently practical unit Nor is time-saving the only consideration; the technique of injection is simpler and easier with the BD* Disposable Cartridge Syringe and Bristol Cartridges of Penicillin in Oil and Wax.

PENICILLIN
IN OIL AND WAX

(Romansky Fermula)

The combination comes to you in a sterile package, ready for use Warm the cartridge, test for venipuncture by means of the special aspirating device, and proceed with the injection Then the entire unit is discarded

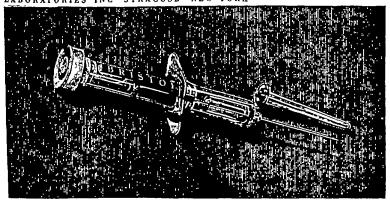

Each Bristol Cartridge of Romansky's original formula contains 300,000 units of calcium penicillin, which is adequate to maintain blood levels for as much as 24 hours Available through your regular source of supply

The B-D* Disposable Cartridge Syringe is sterilepacked, one to a box, with one Bristol Cartridge of Penicillin in Oil and Wax. Bristol also provides the B-D* Metal Cartridge Syringe, a permanent instrument for repeated use.

Intraderm Sulfur's Action in Acne Vulgaris

1

HE INTRADERM PRINCIPLE. Intraderm Sulfur Solution penetrates intact human skin through hair follicles and schaecous glands and to a lesser degree through sweat glands. Sulfur is in all parts of the lesions to exert its oxido-reduction effect.

HUMAN SKIN INUNCTED with Intraderm Sulfur vehicle containing tracer substance. Material (yellow stain) impregnating follicle, cutis and epidermis. Below upper horny layers is a color free band along stratum lucidum, indicating aits of barrier to peneration. Photo from Kodachrome transparency

NEW SKIN PENETRANT ACTS INSIDE THE LESIONS

A new effective treatment for acne vulgaris is now available to every physician

This treatment combines the new principle of skin penetration' with the old well-established beneficial action of sulfur in acne

The site of acne lesions is below the skin surface, in the follicles Intraderm Sulfur Solution penetrates to these areas to exert its heal ing effect.

Extensive clinical atudies, have proved the efficacy and safety of Introderm Sulfur

Intraderm Sulfur Solution consists of 0.75% polysulfides in a fundamentally new skin penetrating vehicle designed to allow preferential action of sulfur at the sites involved in acne vulgaria. It penetrates the normal and diseased follicles. The well known actions of sulfides occur within this apparatus

Joint action of the chemical and physical properties of Intraderm Sulfur produces these results

Increased hyperemia, enhancing the natural defense mechanisms.

Keratolytic action, stimulating surface desquamation and softening beratin blockage in follicles.

The solvent action of the vehicle softens the foreign matter (dirt and oxidized sebum) in the follidle, while the effective wetting agents aid in its removal.

Intraderm Sulfur is well tolerated, and, above all, easy to use.

It leaves no unsightly areas no white, disfiguring mask—no greasy surface—after application.

It can be used day and night, thus assuring continuous sulfur ef fects. It is an excellent skin cleanser

Each application takes only a few minutes.

I VOREDUCKTS: Bullur (as suifides and polysulfides) 0.75% triethanolumine 10.0% modium mired alby benzene suifonate 11.0% anti-pyrine 11.0% propylene glycol water

Editorials

A National Secretary of Health

As long ago as 1884 the House of Delegates of the American Medical Association urged that a separate Department of Health be established in the Federal government under a Cabinet officer From 1891 to 1902 references¹ appear in the minutes of the annual sessions of the American Medical Association to the advisability of such action, and reappear annually from 1906 to 1913, again in 1917 to 1930, also in 1935, and 1938

Actually, in 1879 Congress passed legislation authorizing a National Board of Health, appropriated no money therefor, and repealed the legislation in 1893. It has been through no lack of prodding by the A.M.A. that such a national department has yet to be established by Congress. At the present time opinion on this subject in the A.M.A. seems to favor such a department as an agency separated from other activities of government.

Three bills bearing on this subject have been introduced into the Senate in the cur-

¹ Bulletin No 6 March 5 1947 Council on Medical Service, American Medical Association.

rent session S 140 Taft—Fulbright, S 712—Aiken, and S 545—Taft, Smith, Fulbright. Briefly, S 712 would create a Department of Health, Education, and Security to be administered by a secretary, an undersecretary, and two assistant secretaries. S 140 would create an Executive Department of Health, Education, and Security with an administrator of Cabinet rank, and each of the three divisions to be headed by a specially trained person. These two bills are in the Senate Committee on Expenditures in the Executive Department

S 545 would create a single Federal agency thus avoiding the combination of health education, and welfare proposed in S 140 Says the *Bulletin*¹

While the American Vedical As ocustion is still of the opinion that the health of the nation warrants a separate Department of Health with a Cabinet officer at its head it réalizes that it may be impractical to develop this at the present time Furthermore, it is its opinion that if a separate department of health is not feamble it is possible to group health activities in a separate bureau. The Associa

tion is opposed to having health activities grouped with other activities in a department with Cabinet status

S 545 defines the policy of Federal grantsin-aid to states "to make available medical, hospital, dental, and public health services to every individual regardless of race or economic status", makes provision for "voluntary deductions from the salary of Federal employees of premiums directed by them to be paid to voluntary nonprofit health insurance funds" It makes the Public Health Service subordinate to the National Health Agency, whose administrative head, appointed by the President, must be "a doctor of medicine licensed to practice in one or more of the States and ing in the field of medicine" It makes voluntary the participation of the several states and removes the Children's Bureau from the Federal Security Agency It gives any participating state the right, if dissatisfied with the Director's actions, to appeal to the United States Court of Appeals It thus secures on a voluntary basis most of the objectives long sought by organized medicine

The bill is admittedly not perfect we feel that it could be supported by our membership and should be on the ground that its principle is correct Controversial matters could be and should be settled by The important features of S 545 are that it creates a single National Health agency to administer the activities of the Federal Government relating to health, eliminating confusion, waste, duplication of effort, that it maintains the principle of voluntary, not compulsory, participation in the Federal program by the several states, that it maintains the right of appeal to the courts from the actions of the administrative head of the agency, and that it makes available to every individual who needs it medical, dental, hospital, and public health service minus the contemptible yoke of compulsion

The Woman's Auxiliary

The doctors of the State would indeed be remiss if they did not acknowledge the splendid work which the Woman's Auxiliary of the Medical Society of the State of New York has done to assist the numerous educational and informational activities of the Society Under capable and enthusiastic leadership, membership in the auxiliary has been increased by about 30 per cent in this year alone

Ten additional county medical societies now have Woman's Auxiliaries organized this year, which brings to thirty-six the total for the State's sixty-one counties. Recognizing the increasing help given to the doctors of the State by the Auxiliary, the Medical Society of the State of New York this year encouraged the expansion of its activities by extending financial assistance. This action, among other things, has resulted in the foundation of a new publication

The Journal welcomes the new publication The Distaff, to be printed quarterly by the Woman's Auxiliary to the State Medical Society The first issue appeared in April, and carried news of Auxiliary activity to the homes of 2,400 members

The editor of the first number is Mrs Bradford F Golly, of Rome, New York, the press and publicity chairman of the State Auxiliary Plans for the future include the setting up of an editorial staff to handle the quarterly

The Auxiliary hopes through this medium to increase its membership, to stimulate interest in the organization, and to build and maintain a spirit of friendship throughout the State Auxiliary

Through the Advisory Council to the Woman's Auxiliary has come the recommendation that closer cooperation be encouraged between the Legislative Committee of each county society and the Auxiliary, and the Public Relations Committee of the county society and the same committee of the Auxiliary

What will be accomplished by this collaboration? First of all, the Auxiliary is per-

mitted to act only with the permission of the county medical society If the Legislative Committee of the county society is going to direct the legislative action of the Auxiliary at its disposal, it behooves the doctors to find out with just what kind of a group they are working The Legislative Committee of the Auxiliary is best qualified to inform them of the capabilities of their organization in that field and the legislative activities of other local women's organizations. Since the province of legislation is new to many Auxiliary committee members, the county society would do well to help apprise them of local political background and the history of much of the legislation that lies before them building an informed group and encouraging interest in legislation, the Society will reap the reward of having groomed an active, intelligent committee at the county level capable of responding ably to direction Besides, did you ever notice that nothing teaches a teacher as much as teaching?

Circumstances have forced the doctor to take an active part in public relations. It is no longer enough for the patient-physician relationship to exist as indication of public relations.

The people have come to demand evidence of concerted effort on the part of what they term "organized medicine" against the evils of a socialized program for medicine. The answer is the Ten-Point

Plan of the American Medical Association But this plan will sink to the indiculous level of the usual political platform if it is not backed up by results locally brought about through the efforts of the county medical society. This makes the work of public relations assume mountainous proportions. But, if it is broken down year by year, and project by project, much good may be accomplished.

Here again the Auxiliary can be of help The purpose of the Ten Point Plan is to bring about improvements in local health. If the Auxiliary can interest the women's groups in school health programs, adequate recreational facilities, and health education, definite progress will be made

Let the county society prepare plans for action in preventive medicine and show the Auxiliary where work can be done to produce the desired results.

Eleven years of Auxiliary work has shown that Auxiliary projects have taken their place in community activity. They have served as the liaison between the public and the doctor, and carried the responsibility commendably. The Auxiliary has gladly passed out informative legislative material, written letters to legislators, compiled mailing lists, and carried out other projects of the odd job variety.

We cannot commend too strongly the work of this group of interested women

Year of Celebration

It will be of interest to antiquarians to note that this year the Medical Society of the County of Westchester will celebrate its esquicentennial year Founded in 1797, it antedates the Medical Society of the State of New York by ten years This for the record.

The American Medical Association and the New York Academy of Medicane celebrate their centenary years of profoundly useful service to the public and the medical profession also in 1947

Those who have followed the recent publication in the Journal of the American Medical Association of the history of the American Medical Association, by its versatile editor,

Dr Morris Fishbein, will have a profound appreciation of the service rendered by the national association to medical education and practice in the United States.

Not the least important adjunct to this distinguished service has been the Journal of the American Medical Association, one of the best edited medical publications in existence

We extend our heartiest felicitations to the American Medical Association on its one hundredth anniversary of consistent battle to uphold the best traditions of American medicine.

We sincerely hope that the Atlantic City Session will do justice to the event.

Smallpox Is With Us Again

The dreaded scourge of smallpox has manifested itself in two places in the State of New York and in one area of New Jersey recently and its occurrence has produced the expected queries as to the whys and wherefores

The news items are well known but it may be natural to ask how did an unvaccinated individual cross the Mexican border? Apparently a diagnosis was not made in time after his arrival in New York before he had spread the disease among others Perhaps this can be excused, or rather explained, because the features of the disease, especially if accompanied by unusual symptoms as in this instance, proved a puzzle to physicians unfamiliar with such a rarely witnessed ailment But unfortunate as all this was, we can draw a lesson from it, namely, that universal vaccination is essential

The Health Department of New York City has done a good job, the Commissioner and his associates did instill into the community, by well handled publicity, the need for the protection of the inhabitants of the crowded city of New York The vaccination campaign was well organized, the response most satisfactory, but it is hoped that the "scare" will impress everyone with the continuing need of the well-proved methods of prevention There should be no objectors, but for the information of those who are unfamiliar with the Public Health Law, Section 310, entitled "Vaccination of School Children," prohibits a child from attending school unless vaccinated, in a city having a population of 50,000 or more inhabitants Also Subdivision 2 provides that whenever smallpox exists in any other city or school district, the State Commissioner of Health shall certify in writing to the school authorities in charge of any school, and it shall become the duty of such school authorities to exclude from such schools every child or person who does not furnish a certificate from a duly licensed physician to the effect that he has successfully vaccinated such child or person

Section 311, entitled "Vaccination, how made, reports" etc, states that no person shall perform vaccination for the prevention of smallpox who is not a regularly licensed physician, and states the vaccine virus that shall be used, the reports that shall be made, etc

The good results of vaccination in smallpox, diphtheria, and typhoid are too well known to admit of any doubt in the matter Let it be a warning

Shortage of Medical Personnel

Dr Raymond B Fosdick, president of the Rockefeller Foundation, raises the point¹ that very serious shortages are now being encountered in adequately trained medical personnel 2 Dr Fosdick should know foundation assists education and research on the basis of need "in every country that boasts of a respectable university, a hospital, or a research institute

The need apparently is for free funds, those not earmarked by donors for specific Medical schools, operating under higher costs and greater demands upon them, find their revenues from endowments dwindling, new sources of support curtained by heavy taxation, while governmental and foundation funds though generously provided are earmarked for specific causes Some forty-three of the nation's medical schools are supported solely from endowments, gifts, and tuition fees, others supplement public support from private sources Several schools estimate that they need twice their current income merely to maintain present programs

This problem apparently is one of improper balance, too much money for research, too little to teach the personnel who The war is must accomplish the research responsible to a certain extent for senselessly dissipating our resources of partly

⁻FAnnual Report of the President 1946 ² N Y Herald Tribune March 21 1947, p 24 ³ N Y Times, March 22, 1947, p 12

trained scientific personnel, men who should have been kept in the research laboratory and in the universities But that is what war does.

Faculty salaries must be increased or the schools cannot hold their best teachers. How then can the schools graduate competent research scientists and physicians? The picture, as Dr Fosdick describes it, begins to resemble some of the fragmented absurdates which as "abstractions" pass as modern art, depicting everything but common sense which seems to be so abstract that it escapes notice

Good teachers are few enough under the best of circumstances War, by upsetting the continuous flow of promising student and instructor personnel, diverting it into mili tary channels, cuts deeply into the usual processes of continuity by which high levels of teaching efficiency are maintained. To add further difficulties by restriction of available free funds seems indeed, as Dr Fosdick says, like trying to "grow orchids in a greenhouse that lacks coal"

The current sad plight of our system of public education, with respect to its teachers at the lower school levels, is bad enough To repeat the same fundamental errors at the university and postgraduate school levels does not seem to make sense to us at least, nor, apparently, to Dr Fosdick.

Current Editorial Comment

Health Problems of the Old If it isn't one thing in this life, likely as not it's two others. When the experts get out the abacus and pencil, look alive, brothers! Now it appears! that important and progressive changes have been taking place in the structure of the population. Old people are piling up on us

First, the birth rate dropped about a third between the beginning of the century and the war years. This has been coupled with an almost complete cessation of immigration which formerly brought into the country large numbers of relatively young persons. As a result of these two factors and the increasing proportions surviving into middle and later life there has been a marked shift in the age distribution of the population.

Seems that health agencies, both the official and the voluntary kind have been on the warpath against

such conditions as the communicable discases of childhood, the infections and other disorders incidental to childbearing and on sanitation with special emphasis on control of typhoid fever the diarrheal diseases and tuber culosis. This was a natural development since the discoveries of bacteriology and their application to medicine and surgery provided the soil for a rich harvest in the prevention and control of disease. The beneficial effects of the campaigns thus initiated were mainly concentrated on the younger people

And because of this, by 1940 the people

of 45 years or more had increased to more than one quarter of the total population In 1900 they were only one fifth of the total It is evident that the public health program will have to change its emphasis to cope with the problems of such a shifty demos More and more, says the Bulletin,

Activities must be concentrated on the diseases and conditions which affect the older ages. Even now, of the five leading causes of death in our country, four—heart disease cancer, cerebral hemorrhage and nophritis—are diseases characteristic of middle life and old age. In the same category are diabetes and arteriosclerosis, which rank among the first ten causes of death. Altogether, these six causes account for more than three fifths of all deaths registered in the United States in 1944.

Well, the statisticians, the abacus jugglers, seem to have the right of the matter and it's up to the doctors and the public health authorities to pay attention. It is likely that right now about 70 per cent of people permanently disabled are at ages 45 or higher, by the end of the century, says the Bulletin, "80 per cent of the invalids in the United States will be in this age range"

Irradiation Sickness Irradiation sickness is an annoying and sometimes a seriously interfering factor in the x ray treatment of malignant disease. It is capricious in its appearance as many patients never experience it, others as only an occasional faint

¹ Statistical Bulletin Metropolitan Life Insurance Co Dec 1946, page 6.

nausea or anorevia It occurs rarely in treatment over the extremities, somewhat more often in those over the thorax, and commonly over the abdomen, most particularly over the upper abdomen, where the fields of exposure include the liver, stomach, and the region of the celiac axis The employment of pyridoxine hydrochloride (vitamin B₆) for this condition was first reported by Maxfield in 1943 ¹ In the October, 1946 issue of Radiology are three articles on the subject by H L Van Haltern² of the Henry Ford Hospital, Detroit, by A Oppenheim and Bjorn Lih³ from Memorial Hospital, New York, and by Lawrence D Scott and Gadston J Tarleton, of the George W Hubbard Hospital, Nashville, Tennessee The first author used intravenous injections of 25 to 50 mg of the drug, in the form of hexabetalin, at intervals of two to four days, depending on symptoms, in a series of 81 patients, excellent results were obtained in 44, good results in 28, little or no benefit in 9 Oppenheim and Lih prefer the peroral route, using 75 to 100 mg doses three to four times Scott and Tarleton use the hypodermic method All agree that the drug is useful and, in the main, successful for this purpose, with no unpleasant concomitant or after-effects to be expected

A different attack on the problem was presented in the same issue of Radiology by John C Glenn, Jr and Robert Reeves,⁵ from Duke Hospital, Durham, North Caro-The antispasmodic drug, trasentine (75 mg per tablet), was used initially on 26 patients, with a dosage range of 225 to 1,000 mg per day in divided doses Thirty-two patients were then treated with trasentinephenobarbital in doses of 1 or 2 tablets three times a day (20 mg trasentine, 20 mg phenobarbital per tablet) Variations of Variations of these doses were later tried Of a group of 65 patients, only 6 failed to gain relief patients who had taken pyridoxine hydrochloride without benefit responded well to trasentine

This timely symposium also includes a discussion of the correlation, not always consistent, between size and location of the treated field and amount of daily dose, and the development and degree of sickness Notwithstanding the appealing theories and considerable experimental work, the com-

¹ Maxfield J R Jr McIlwain A J, and Robertson, J E

plete chain of events in the body between application of x-ray and irradiation sickness is not known as yet and demands further investigation

Parking Space for the Doctor seeking to strike the optimistic note, we can think of one good thing that came out of the recently terminated war

A hospital in New York was built in The architect evidently had in mind the fact that its patients were to be composed largely of cripples, who might be expected to arrive in vehicles rather than on the hoof He therefore designed an imposing semicircular driveway leading to a special door opening directly into the waiting room

Twenty-nine years were to pass and The hospital was desthen came the war ignated as an emergency station ambulance tried to drive in one night with an ordinary accident case and got The utilitarian charstuck on the curve acter of the driveway had never been Tearing it down and building it up again so that a sufferer might be brought to the door of the healing institution was quite an expensive job

Some years ago, a friend of ours was outraged by being given a ticket for parking outside of a city hospital in the Bronx to which he, a resident of Manhattan, had been giving his services for many years The magistrate who fined him had the grace to apologize but he had to pay the He told the story to a friend of his, a Justice of the Supreme Court, and some weeks later a membership ticket in the Patrolmen's Benefit Association appeared ın hıs maıl This protected him for a year, but when our friend declined to contribute to the funds of the organization his ticket was not renewed

What does it profit a conscientious doctor if when he arrives at his destination, he can find no place within ten blocks in which to And if he can and does park, he gets a ticket for obstructing traffic while he is taking out the appendix or delivering the baby

Boston is proposing to undermine the Common to provide parking space 1 We do not expect New York readers to comprehend the prodigious significance of such a statement, but it throws an interesting light on the importance of the parking problem and gives an example we should do well to emulate

PROTAMINE INSULIN MIXTURES IN THE TREATMENT OF DIABETES MELLITUS

ARTHUR R COLWELL, M D Evanston Illinois

(From the Department of Medicine Northwestern University Medical School and Evansion Hospital)

THIS report presupposes that there is ment in keeping diabetics sugar free if possible without other more important penalties. Along with the minimum objectives of treatment namely, maintenance of strength and weight, freedom from symptoms, prevention of acidosis and avoidance of insulin shock it also is generally agreed to be desirable to avoid glycosuma in the interests of future health.

By the use of improved methods of using insulin, it is possible to do this in many cases difficult to adjust by orthodox methods. In the discussion which follows, 'good control" means as nearly sugar free as possible throughout each day and night on a maintenance diet and the smallest possible number of injections without undue risk from insulin shock.

From the standpoint of clinical usefulness in severe diabetes, neither of the two standard insulins, soluble and protamine sinc insulin, is ideal for routine day by day use Because it is in solu tion, ordinary insulin is absorbed rapidly and within a short time exerts a strong effect which fades quickly Hence it must be given frequently and in excess it tends to cause violent hypoglycemic symptoms. With soluble insulin alone, it is impossible to control severe diabetes unless multiple daily injections are given, in cluding one during the normal sleeping hours. The same is true of crystalline insulin, which has an action practically identical with that of or dinary maulin

The introduction of protamine insulin into the therapy of diabetes mellitus in 1936 by Hagedorn and Jensen¹ certainly produced many ad vantages. By its use multiple injections are reduced, glycosuria is better controlled on the average violent insulin shock is less frequent, acidosis is less likely to occur and general health and nutrition in severe diabetes are improved Yet experience reveals certain well-defined disadvantages inherent in a preparation of such in solubility all due to slow or uncertain absorption

Because of its slow weak, and prolonged effect extending over a period of several days, daily depots yield a continuous supply of insulin at

undulating basic levels characteristic of the indi-

vidual and dosage. Two difficulties arise from this source

First, the continuous supply fails to allow for intermittent feeding and fasting habits, so that glycosuma tends to follow meals and hypoglycemia tends to occur during fasting, particularly at night or if the morning meal is delayed

Supplementary injections of soluble insulin partially correct these faults, but multiple injections again are involved, the very thing that protamine maulin was designed to avoid Small supplementary doses of soluble insulin are ineffective if mixed with larger amounts of protamine insulin because the excess of protamine in the latter immediately precipitates insulin added to it, thus mcreasing the dose of protamine insulin by the amount of insulin added.2

Second even though the dosage is constant, the action is often unpredictably variable. Probably because of variations in rates of absorption from different depots unexpected waves of glycosuria or hypoglycemia tend to appear, causing an irregular type of control in spite of constant conditions of therapy Because these ir regularities are unpredictable, they are not manageable by supplementary injections of soluble insulin. Too often they magnify the characteristic action of protamine insulin i.e., nocturnal fasting hypoglycemia or postprandial glycosuria

A fairly large proportion of all diabetes mellitus cases, perhaps as much as one fourth of all as of such severe grade that adjustment by diet and ordinary or protamine sinc insulin alone is difficult. It is these patients who reflect the disad vantages of the standard insulin preparations and are difficult to adjust by ordinary therapeutic methods. On the average, these patients are either young or their diabetes has existed for years, or both. Most juvenile diabetics fall into this category within a year or two and the longer the diabetes exists the more difficult is good con trol, as a rule. Among older adults the severe form is not infrequent, although it is by no means as common as when the disorder begins within the first two decades of life

Protamine Insulin Mixtures

It is possible to modify the action of commercial protomine sine insulin by the addition to it of excesses of soluble insulin. Its action is thereby

Condensed version of a paper presented to the New York Diabetss Association at the New York Academy of Micdicine March 29 1946.

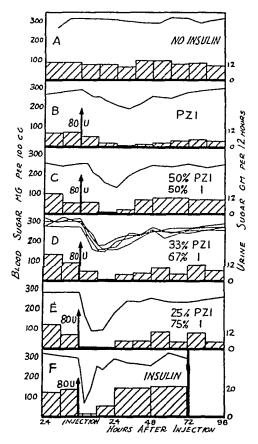

Fig 1 Typical responses of stabilized blood and urinary sugar (A) to single 80-unit doses of protamine zinc insulin (B), insulin (F), and 1 1 (C), 2 1 (D), and 3 1 (E) mixtures of the two insulins

accelerated to the extent that daily morning injections yield more insulin when needed during the feeding period of the day, and less at night during fasting 3 Typical blood and urinary sugar curves in stabilized diabetic patients illustrating the action of single doses of protamine zinc insulin, soluble insulin, and various simple mixtures of the two are shown in Fig 1 The blood and urine sugar curves following the arrow show in each case the timing and intensity characteristics of each of the insulins studied B, in Fig 1. shows the slow, weak, prolonged action of a single 80-unit dose of protamine zinc insulin and F contrasts the rapid, intense, and brief effect of ordinary insulin in solution The peak values are about twenty-four and four hours, respectively, and the duration of action about three days for protamine zinc insulin, and twelve hours for insulm C, D, and E show the comparative actions of 1 1, 2 1, and 3 1 mixtures of insulin with protamine zinc insulin These are simple unbuffered mixtures of the two commercial preparations in the U-80 concentration

Such mixtures are clearly intermediate in effect between protamine zinc insulin and insulin

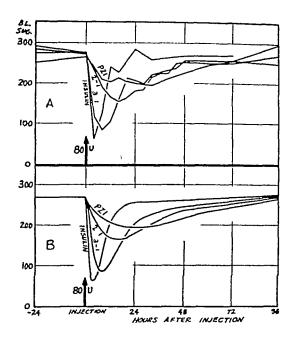

Fig 2 A—Average blood sugar curves for all identical doses of similar insulins or insulin mixtures in all patients B—Diagrammatic representation of the average curves shown in A, arbitrarily smoothed to discount minor irregularities considered not to be due to insulin

Any desired intermediate effect may be obtained by the use of suitable proportions In this connection, it is of the utmost importance to recognize that the difference between protamine zinc insulin (B) and a 1 1 mixture (C) is relatively insignificant compared with the difference between a 2 1 mixture (D) and a 3 1 mixture (E) Even though the mixture contains as much insulin as protamine insulin (as in C), the peak action from a large dose still occurs at about twentyfour hours and little effect is evident during the first twelve hours after injection, in contrast with the 2 1 mixture (D), and especially the 3 1 mix-These comparisons conform to comture (E) mon clinical experience

Fig 2 shows composite curves (above) obtained by averaging all comparable data so obtained on twelve subjects and the same curves (below) arbitrarily smoothed for diagrammatic purposes, all superimposed to show the characteristic features of each of the standard insulins and 2 1 and 3 1 mixtures of them

It may be of interest to consider the reasons for the obviously peculiar fact that the action of protamine zinc insulin is not altered much until excesses of insulin are added to it

We have reported in detail careful studies of this phenomenon, here it is possible to present some of the findings only in summary form

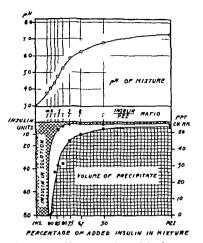

Fig. 3 Soluble and precipitated insulin components and pH of unbuffered simple mixtures of crystalline insulin and protamine sine insulin. The two commercial insulins used in the mixtures are shown at the extremes for comparison

Soluble and Insoluble Components of Simple Mixtures

All investigators agree that simple mixtures contain most of their insulin in precipitated form even when excesses are added which alter the action of protamine zinc insulin.

The fact that almost all of the insulin in simple mixtures joins the precipitate is illustrated by Fig 3. The characteristics of commercial protamine mic insulin are shown at the right and of solution of sine insulin crystals at the left of the graph. Various simple mixtures of the two are shown between these extremes.

Thorough centrifuging of the various suspen tions separates them into soluble and insoluble fractions, the insulin content of each of which can be measured approximately by appropriate methods' which cannot be described here uble and insoluble fractions present in 80-unit quantities of each mixture are shown in the lower half of Fig 3 The insoluble fraction remains fairly constant in preparations varying from protomine sine insulin on the right, through 3 1 proportions at the elbow of the curve, it then decreases rapidly until it disappears in 8 or 10 1 proportions at pH about 40 The soluble fraction likewise varies little until 4 1 proportions are exceeded, when it increases rapidly as the precipi tate decreases, eventually comprising all of the Together the two fractions account mixture

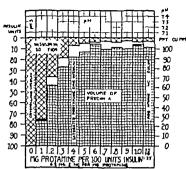

Fig 4 Soluble and precipitated components of maulin resulting from increasing additions of preos mine and sine to 100 units of insulin at pH about 7.2 Crystalline and protentine zinc insulin are shown at the extremes for comparison

fairly well for the insulin known to be present, if each cu. mm of precipitate is assumed to represent about 11/2 units of insulin plus protamine and

Soluble and Insoluble Components of Buffered Mixtures

The possibility that insulin is precipitated as such in mixtures with intermediate pH at which insulin itself is meduble was investigated by studies of buffered preparations. Fig 4 shows the results of fractional analysis of preparations in which the pH and insulin are constant but the protamine and sinc content vary from no protamine, as in solution of zine insulin crystals (on the left) to about 10 mg protamine and 0.2 mg zine per 100 units of insulin, as in commercial protamine mac insulin (on the right) from right to left, precipitated and soluble insulin fractions remain fairly constant at levels com parable to those of standard protamine rine insulm until the amount of protamine falls below about 0.4 mg per 100 units of maulin These are the approximate proportions of a 2 1 mixture, the chief difference here being that the pH is 7.2 whereas the pH of the simple mix ture is about 60 With less protamine and sine, the soluble fractions increase and the precipitates decrease rapidly, as with the simple mix The sums of the fractions again account for practically all of the insulin known to be present better agreement possibly being due to the fact that the pH and, therefore, presumably, the physical characteristics of the precipitates are more constant.

Two conclusions appear to be justified by these data. First, excess insulin added to protamine

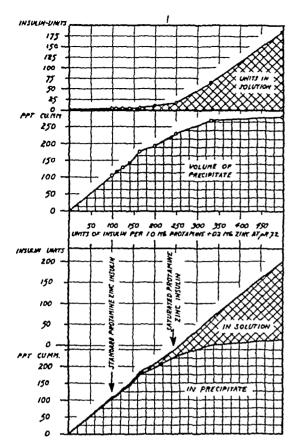

Fig 5 Effect of increasing additions of insulin to 1 mg of protamine with 0 2 mg of zinc at pH 7 2. These data were obtained by recalculation in terms of 1 mg of protamine of the data shown in Fig 4.

zinc insulin must be precipitated in firm combination with protamine and zinc, at least up to the proportions present in 2 1 mixtures it would appear in soluble form in the supernatant fluid of preparations such as these, since it is known to be freely soluble at pH 72 protamine with zinc must be capable of precipitating fully three times as much insulin as that contained in protamine zinc insulin as now marketed. since almost all insulin is in precipitated form with only about one-third that amount of protamine and zinc, even when the preparation is buffered to the same pH This preparation we have designated "saturated protamine zinc insulin," since further excesses of insulin remain in solution This insulin saturated protamine zinc compound corresponds to the 2 1 mixture in composition, except that it is buffered. As shown previously. unbuffered mixtures may precipitate even more

Recalculation of the data just presented gives a convincing picture of what happens at pH 72, when increasing amounts of insulin are added to fixed amounts of protamine and zinc. This is the reverse of the sequence described previously. It is plotted in Fig. 5, above, which shows the pre-

cipitated and soluble fractions as increasing amounts of insulin are added to 10 mg protamine and 02 mg zinc at pH 72

Here the relation between insulin and protamine with zinc is evident. At ordinary temperatures and pH 7 2, practically all insulin up to 250 to 300 units added to 1 mg of protamine with zinc is precipitated in an insoluble compound. Above this level all added insulin is recovered in the supernatant and the precipitate increases no more. In the preparations containing less than 250 units per mg of protamine, the excess protamine in the precipitate is proved by its absence from the supernatant and by the fact that it can precipitate additional insulin

In the simplest possible terms, these findings indicate that 250 to 300 units (10 to 12 mg) of insulin can be precipitated by 1 mg of protamine with 0.2 mg of zinc at pH 7.2 and at ordinary temperatures. Above this "saturation level" all added insulin remains in solution. It is of interest to note that this saturation level corresponds closely to the statement by Hagedorn and his associates that "the amount of various protamines which combine with the insulin is about one tenth of the weight of the latter"

Action of Precipitates Which Have Been Washed

A most conclusive demonstration of the fact that these intermediate preparations are new compounds of insulin with protamine and zinc rather than simple mixtures of insulin and standard protamine zinc insulin is seen in the action of their washed precipitates (Fig. 6). The precipitates from the preparations containing 0.1, 0.4, 0.7, and 1.0 mg protamine per 100 units insulin were separated from their supernatants and washed five times with a solvent buffered to pH 7.2. The washings were discarded and the washed precipitates resuspended in the buffer solution.

Injection of these washed compounds into stabilized diabetic patients in estimated 80-unit doses gave the curves shown When compared with insulin (above) and protamine zinc insulin (below) in comparable doses, they were intermediate in action between the two standard insulins, and their degree of prolongation of action was proportional to the amount of protamine present The two patients used for testing responded differently to the same preparations, patient B showing a greater sensitivity toward insulin than Yet the comparative effects were the same in both, less protamine resulted in greater promptness and intensity and less prolongation of action and vice versa

When averages are calculated for the curves obtained with all saturated precipitates (those containing more than 250 units insulin per mg prota-

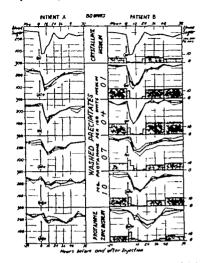

Fig. 6 Time action of saturated (0 1 and 0 4 mg protamine per 100 units) and unasturated (0 7 and 10 mg protamine per 100 units) precipitates compared with crystalline and protamine sinculuin The observations were made on 2 diabetic patients with blood and urine sugar stabilized by lour hour feedings. The cross-hatched blacks represent urine sugar the curves, blood sugar

mine) and those obtained with all unsaturated precipitates (those containing less than 150 unit per mg protamine) the composite curves shown in Fig 7 are obtained. They resemble the simple mixture curves shown previously again demon strating the modified action of compounds containing less protamine which of course could not be due to insulin in solution.

To sum up, it seems fairly certain that the socalled mixtures of insulin and protamine sine insulm are more complex than they would seem at first glance. Their action cannot be visualised as simple summations of the effects of the two insu lins of which they are composed Rather they must be considered as new compounds with monophasic action none of which are typical of the two standard insulins By virtue of their greater insulin content in proportion to the protamine and sine present they are more saturated with insulin than standard protamine sine insulin, are probably more soluble in tissue fluids and, hence, while they still act as depot insulins, they possess pharmacologic effects of intermediate intensity Any desired intermediate effect and duration may be obtained if excesses of insulin are added, but prolongation of effect is lost as promptness

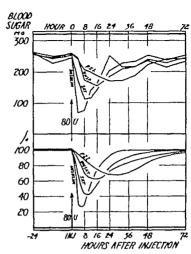

Fig. 7 Blood sugar curves from Fig. 6 averaged (above) and arbitrarily smoothed (below) to show intermediate time action of saturated (0.1 and 0.4 mg protamine per 100 units) and unsaturated (0.7 and 1.0 mg protamine per 100 units) washed precipitates, compared with standard insulin and protamine sinc insulin Note the similarity of action between these washed precipitates and the simple mixtures shown in Fig. 2.

and intensity are gained, and vice versa the purely pharmacologic standpoint, it is obvious that the modifications most likely to give good control of diabetes mellitus in a single morning dose are those which release insulin most rapidly during the first eight to sixteen hours after injection and yet retain sufficient sustained effect so that the sugar level is still depressed twentyfour hours after injection, thus permitting a significant degree of overlapping with the next morning a close. For practical purposes, this ideal effect is obtained with preparations con taining about 250 to 300 units of insulin per mg of protamine. In terms of simple mixtures, this corresponds to two to three parts of soluble in sulin thoroughly mixed with one part of commercial protamine and insulin. As a matter of fact it is these preparations which have proved to be the most useful in clinical practice "

Results of Treatment with Mixtures

During the last five years, 150 patients have been treated with mixtures. As stated previously these patients all have diabetees of sufficient seventy so that good balance with protamine insulin alone was unobtainable. All had shown

TABLE I -- Most Common Proportions of Insuling in Mixtures Crystalline Protamine Zinc Insulin

Ratio	Patients	
		Percentage
2 1	127	85
21/: 1	5	3
$\frac{2^{1}/*}{2^{1}/*} \frac{1}{1}$	11	7
3 1	3	2
Unsatisfactory	4	3
Total	150	100

postprandial glycosuma, often heavy, with protamine insulin alone. Many had experienced severe and unpredictable insulin shock, usually Some idea of the severity of the diabetes is gained by the fact that almost half are juvenile cases, i.e., less than twenty years of age at onset of diabetes About two thirds were under thirty when diabetes appeared The average daily insulin requirement for the group is about 50 units About one third require 60 or more units daily, 15 of them from 80 to 105 units

Of this group of 150 severe diabetics, four patients obtained poorer control with mixtures, two returning to regular insulin in two doses daily and two returning to protamine zinc insulin and insulin by separate injection Five of the remaining 146 patients were sufficiently difficult to adjust with a single dose of a mixture daily so that it was divided into two doses, morning and evening, with better control The other 141 patients were all satisfactorily balanced on a single injection of the mixture before breakfast each morning

Table I above shows the most effective mixtures (usually in one dose daily) used in routine control of severe diabetes in 150 patients ratios in the mixtures are expressed in terms of units of crystalline insulin units of protamine zinc insulin, both in the U-80 strength and thoroughly mixed Diets of moderate carbohydrate value were used, usually carbohydrate equal to fat in grams

The most significant fact about this group of patients is that 127 of the 146 using mixtures, or about 8 out of every 9 patients, were balanced satisfactorily on a 2 1 mixture, practically always in a single dose daily. In not one single instance has it been found desirable to use less than 2 1 proportions By 2 1 proportions is meant, of course, a thorough mixture of two parts regular or crystalline insulin with one part of protamine zinc insulin, both in the U-80 strength

About 12 per cent of all patients using mixtures obtained better control with slightly more insulin in the mixture than 2.1 proportions tients, $2^{1}/_{3}$ 1 mixtures, and in 11 patients $2^{1}/_{2}$ 1 mixtures were more efficient Three patients, all rapidly growing juveniles at about the age of puberty, obtained best control with 3 1 proportions In not one instance was it found de-

sirable to exceed 3 1 ratios Significant overlapping is a highly advantageous feature of any insulin designed for use once daily wide swings in sugar levels are inevitable, towards glycosuma after breakfast and towards insulin shock before the evening meal reason, it seems desirable to keep the glucose value of the diet at a moderate level and use mixtures of approximately 2 1 proportions It must not be forgotten that as promptness and intensity of any insulin are gained, sustained action is sac-With any depot insulin, it is the sustained action overlapping the next dose which tends to avoid heavy glycosuria and acidosis in the intervals between the crests of successive doses-after breakfast in the case of daily morning injections

The results of routine treatment of these patients with severe diabetes can be summarized briefly as follows First, the amount of insulin required for good control was about 10 per cent less, on the average, than with other insulins Second, glycosuma was easier to avoid insulin shock was less frequent and not so violent Fourth, unexpected irregularities of adjustment were less frequent Fifth, general health was better as a rule Finally, these advantages were gained in spite of the fact that only one injection daily was required by nearly all patients

Discussion*

Franklin B Peck, M D , Indianapolis, Indiana **-Although at first glance the data that Dr Colwell¹ has presented may appear widely divergent from my own,2 the differences are more apparent than real, and on points of major clinical importance we are in excellent agreement

General clinical agreement has been reached that suitable admixtures of unmodified insulin and protamine zinc insulin may be prepared which show any desirable intermediate action ranging between insulin and protamine zinc insulin in promptness, intensity, and total duration of effect Several years of study of these and other modifications which have been especially prepared for the purpose have resulted in agreement that the most widely useful

^{*} Presented at the meeting of the New York Diabetes Association March 29, 1946 as a supplemental discussion to Dr Colwell's paper ** From the Lilly Laboratories for Clinical Research and

the Diabetic Clinic, Indianapolis City Hospital

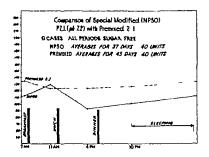

Fig. 8 Comparison of 2.1 premixed and (NP50)

preparations are those having the time-activity of the 2 1 (insulin to protamine sine insulin) mixture described by Dr Colwell and the buffered combina tion which has been reported on previously by Dr MacBryda. The former contains 0 42 mg of protamine per 100 units of insulm and has its pH value at about 50 whereas, the latter is made from 0.5 mg of protamine per 100 units and is buffered at the time of manufacture to pH 7 2 Direct comparisons of these two preparations in the same group of patients show only minor differences in their effects, and justify the conclusion that either one is capable of meeting the normal physiologic needs of the average diabetic patient Each provides sufficient insulm to meet daytime requirements and a long enough duration of action to maintain proper levels in the fasting state, on account of the fact that both preparations display overlapping effects (Fig. 8)

There is still some disagreement as to the mechanism by which these desirable effects are brought about. Much of this may be attributed to the dif ferent conditions under which various investigators worked For example, Ulrich measured centrifuged precipitates obtained from mixtures of standard products. Colwell has made detailed observations of similar washed precipitates, and employed chemical methods for determination of the excess maulin m the supernatants, while Peck* attempted to translate into clinical terms of units of quick and prolonged action the results obtained from animal assays of buffered combinations having the same ingredients as extemporaneous mixtures It should be reemphasized that the figures from these data were only approximate and that they do not necessarily imply that the time-activities of either the quick-acting component or the precipitated component are necessarily identical with those of standard insulin and protamine sinc insulm as marketed

There is another aspect of the problem which should be noted namely that all these different combinations are pharmacologically active not in the water solutions in which they have been studied but in the body fluids, and their effects, therefore, must be considered as being modified in vivo by their dispersion in the protein containing tissue fluids. Hagedorn' (1936) stated, 'It was found that

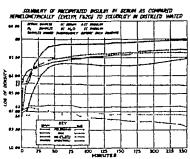

Fig 9 Solubility of precipitated insulin in serum as compared nephelometrically (Evelyn F620) to solubility in distilled water

the insulin-protamine compounds appeared to be more soluble in tissue fluid than in water' and his choice of a particular protamine was influenced by its low solubility in serum.

The effect of blood serum in altering the character istics of several different modifications is shown in Fig 9 This represents but part of one experiment and is cited only to emphasize the importance of the tusue fluids in modifying the rate at which the active principle is released. Four cc. of the insulin sample were added to 6 cc of water in one tube, and another 4 cc. of the insulin sample were added to 6 cc of serum in a second tube, and the resulting turbidities were compared nephelometrically (Evelyn F620) after appropriate shaking The ordinary solutions in water showed little change over the four hour period (or for longer periods) but there is a striking alteration in the tubes containing the samples in serum and in some instances, this occurs very rapidly. It may be attributed to the greater solubility of the compounds in serum, and by inference in tissue fluids with consequent more rapid release of the insulin from the insoluble compound

In still other publications of Hagedorn's (1938) some experiments by his colleague Krayenbühl are described to throw further light on the nature of the protamine insulin combinations Increasing quan tities of protamine were added to equal volumes of insulin solution and each of the clear centrifuzed supernatants then divided into two tubes. To the clear fluid in each series of tubes an equal quantity of insulin and of protamine were then added, respec-Turbidities were read in the nephelometer and the reciprocal values plotted as function of the amount of protamine. The curves intersect at a point which is termed isophane to signify the appear ance of an equivalent precipitate on addition of either the insulin or the protamine Compounds corresponding to this point are called isophane compounds. All other proportions of insulin and protamine insulin are called heterophane, and contain a surplus of insulin or of protamine If insulin or protamine is present in the supernatant, the addition of

protamine or insulin, respectively, will cause formation of a precipitate invisible macroscopically, but detectable by nephelometry The isophane compound, according to Hagedorn, has not the maximum prolongation effect, but, on the other hand, can be mixed with insulin to make heterophane compounds with surplus of insulin

The monograph by Krarup⁶ (1935) contains the following statement "The method makes possible the preparation of protamine insulinate compounds of variable solubility, and, furthermore, by precipitating only part of the insulin as protamine insulmate allows the making of preparations still containing free insulin" An example is given of a preparation made so as to contain in the same volume twice as many units of insulin as are ordinarily used with half the insulin precipitated as a protamine compound

Much has been accomplished in the last few years in the evaluation of the needs of the diabetic patient so that his requirements may ultimately be met by devising a particular pharmacologic action to fit his needs rather than readjusting the patient's life,

eating habits, and activities to suit the effect of some manufactured product It is most important for the welfare of the diabetic population at large that the value of any new insulin product be thoroughly proved before it is released on the market

On several occasions in the past I have called attention to the questionable stability of certain of these newer modifications Studies of this factor are being continued The data are still not complete. but I think they now justify the opinion that the problem of stability and of standardization of certain of these combinations will not be insurmountable

WHAT DOES THE MEDICAL SOCIETY OF THE STATE OF NEW YORK DO FOR ITS MEMBERS? Liaison Committee of the U.S Veterans Administration

The Committee on Liaison with the U.S. Veterans Administration was formed in order to investigate means of providing private medical care to the veteran, with Government and The Veterans Administration wished to have a contract or agreement with the medical profession of New York State in order to furnish this medical care

In some states the VA made the agreement with a state-wide voluntary medical care plan not seem feasible in New York State, so we formed a separate corporation representing the medical profes-This corporation really takes the place of the Medical Society of the State of New York, which apparently is not allowed to make such a contract under the present setup. This corpor Veterans Medical Care Plan of New York, Inc. It has charge of the entire program This corporation is known as the There are six directors, originally suggested by the president of the Medical Society of the State of New York, and these are the past-presidents, the president, and president-elect. The Veterans Plan appoints a physician, known as coordinator, in each of the so-called district branches of the V A. The branches are in Manhattan, Brooklyn, Syracuse, Albany, and Buffalo

The coordinator is appointed and paid for by the Veterans Medical Care Plan, Inc Our plan does receive funds from the V A to take care of the expenses of our work but we have complete change of the work of the coordinator Before any physician's claim is paid, the medical coordinator must approve it in each case The Veterans Medical Care Plan furnishes the list of physicians who are those licensed in New York State and it designates the qualifying specialists. It may remove a physician from the eligible list and it has the sole right to do so

We have a fee schedule for service charges paid under our agreement with the V A This fee schedule was adopted after study by the Committee on Liaison who called in representative physicians in groups from many parts of the State It took considerable work to get this fee schedule in order Two reports in the November 1 New York State Journal of Medicine contain a brief of the rules and regulations for the workings of the plan

The Veterans Medical Care Plan requires that physicians should know that a veteran must first have authorization from the VA in order to secure care under this program except in an emergency. Authorization is granted by the VA, not by our group. The veteran states his preference for a physician, and authorizing physicians and coordinators are not allowed to offer the names of physicians. This, of course, is to give free choice. The veteran receives his authorization papers and goes to the doctor. Authorization for examination or treatment usually extends over a period of from one to two months, although sometimes only one examination is authorized

If the veteran wants a specialist and does not know of one, the authorizing physician can show him a list of the specialists in his county. There is usually an additional fee for a specialist's services. For these reasons, county societies should keep their files of general men and specialists accurate and up to date, and should be sure that copies of these are at hand in the authorizing physicians' offices. To fail in this is to interfere with the full privileges of physician and patient. Of course, every county society secretary and president should be fully informed of the facts of the program. I would like to see more articles on the work in the various county society bulleting. in the various county society bulletins

CLINICAL USE OF PENICILLIN IN WATER IN OIL EMULSION

PHILIP K KAUTMAN, M D, Long Island City

EFFECTIVE therapy with penicillin requires that the drug be in contact with the in feeting organism in adequate concentration for a sufficiently long time. Since penicillin in aqueous solution is rapidly excreted from the body repeated injections day and night are necessary to maintain satisfactory antibiotic action. Fre quent injections are often painful for the patient and are an added burden for overworked hospital personnel. Furthermore the continuous treatment required with penicillin cannot be carried out at home without the services of a nurse since it is impossible for the physician to call every three or four hours to give the meetion.

During the fall and winter of 1945 I had occasion to treat a large number of respiratory in fections and it was extremely difficult and frequently impossible to hospitalize the patient. This made treatment at home mandatory. Since trained nurses were scarce the burden was left to the visiting physician. These circumstances led me to seek a means of administering penicillin that would prolong its effectiveness and allow a reduction in the number of daily injections required.

At first I used the so-called Romansky for mula, a solid mirture of penicillin in beswax and pennut oil which had to be melted before injection. This procedure was discontinued since the wax often hardened in the syringe before the in jection could be completed and it was difficult to clean out the residual material from the syringe following treatment. When a complete injection of ice was given the patient complained of pain and of hard painful lumps at the site of the injection

The water in-oil emulsion developed by Freund and Thomson2 was found to be more practical for prolonging the effects of peniculin These authors and their coworkers reported that the use of such an emulsion sustained the effects of penicillin for a longer time than was possible with aqueous solutions of the drug They suggested that prolonged effects resulted from the retarded absorption of the penicillin from the aqueous phase of the water-in-oil emulaion and delayed excretion of the penicillin from the body their study of the effects of such a repository injection they cured 50 of 52 cases (96 1 per cent) of acute gonorrhea with a single intramuscular injection of 150 000 units of penicillin in waterin-oil emulsion In a subsequent study, a single intramuscular injection of 150,000 units of pani

cillin in water in-oil emulsion cured 101 of 105 patients (96 2 per cent) with gonococcic infections. Single injections of 150,000 or 300,000 units of penicillin in aqueous solution resulted in an unsatisfactory cure rate.

These workers found measurable concentrations of penicillin in the serum for four to seven hours The prolonged retention of the penicillin in the body was evidenced by the duration of urmary excretion, which averaged about twenty four hours from the emulsion, and only eight hours from water alone. Although such inboratory determinations are of interest they are not easily carried out by the general practitioner Furthermore, in my experience the results of penicillin therapy can be followed more readily by clinical response than by blood-level determinations Segal and Ryder' expressed the opinion that clinical response is of more value than blood levels in determining the effectiveness of aerosol penicillin in serious respiratory infections field and Halpern state that regardless of theory a continuous blood level of penicillin is not al ways necessary in the treatment of subscute bacterial endocarditis This problem was dealt with experimentally by Jawetz' who atates "It can be shown definitely that the effects of penicilin on the bacterial population in the host lasted much longer than the measurable blood levels of penicillin The latter persisted for only about one hour after the injection of penicillin while the depression of the bacterial population continued for aux to eight hours or longer" Rammelkamp and Kirbys also presented evi dence indicating that some antibacterial effect per sists beyond the time when penicillin is no longer demonstrable in the serum by usual tests. Hav ing a bearing on the subject of peniculin effects is the suggestion that in certain infections in vitro activity may not be an adequate measure of in vivo activity. The problem is further complicated by the findings that the various penicillins differ in their antibacterial activity as well as in the duration of blood levels and rate of urinary excretion following their injection 100

Treatment

Results with the water in-oil emulsion of peni cillin were so satisfactory in the first cases treated

Recent unpublished data indicates that the addition of 2 per cent beseaver to the original formula of Freuda and Thomson gives measurable blood fevrels for sixteen hours siter injection of 200,000 or 300 000 units of penicillin in the water-in-oil emulsion.

that this method was subsequently used whenever penicillin was indicated. Over a period of a year (June 1, 1945, to June 1, 1946), 167 cases were treated (Table I)

At first, 200,000 units of penicillin were dissolved in 14 cc of normal saline solution and mixed with 31 cc of the cholesterol-peanut oil mixture previously liquefied by warming total volume of the emulsion injected was 4 5 cc Since some patients complained of irritation at the site of injection, the total volume was reduced to 3 cc of emulsion for 100,000 units of penicillin and 3.75 cc of emulsion for 200,000 The former emulsion was units of penicillin prepared from 09 cc of water and 21 cc of cholesterol-denvative-peanut oil emulsifier, the latter emulsion was prepared from 125 cc of water and 25 ce of the emulsifier For the occasional patient who complained of pain, even with the smaller volume of emulsion, 2 per cent procaine hydrochloride solution was used as the diluent instead of normal saline solution Honever, usually no untoward reactions such as sterile abscesses were observed. In no case, however, was it necessary to substitute an aqueous solution of penicillin for the emulsion

Water-in-oil emulsions prepared in advance were kept in the refrigerator and used as needed. There was no noticeable decrease of potency in these prepared emulsions after several weeks of refrigeration. It was only necessary to hold the vial under warm water for a short time immediately before using. The simplicity of preparing and administering the emulsion facilitated pencillin therapy at home or in the office. The low cost of the emulsifying agent permits its use whenever penicillin is indicated.

The following case drove home forcefully the need of administering penicillin in a medium that would require fewer injections, even in hospitalized patients

Miss W G, a 25-year-old diabetic, was admitted

for the treatment of a lung abscess When first. seen she had marked chills, sweats, and a tempera-She responded symptomatically ture of 105 F within a week to 30,000 units of aqueous penicilling administered every three hours Penicillin therapy was stopped because of her refusal to be injected further Her reasons were understandable since there was hardly any area of skin on her thin body that was not tender and inflamed from numerous injections of penicillin, the liver and insulin injections, and infusions that she required as a diabetic In forty-eight hours her temperature rose to 105 F. and she had a white blood count of 24,000 with 93 per cent polymorphonuclear leukocytes considerable persuasion the patient consented to the use of penicillin in water-in-oil emulsion. She was given 100,000 units every twelve hours for seven days with symptomatic return to normal

The response in 33 cases of pneumonia treated with penicillin in water-in-oil emulsion was comparable to that observed in cases of pneumonia previously treated with penicillin in aqueous solution given at more frequent intervals. Fever terminated usually by hass, occasionally by crisis, in thenty-four to forty-eight hours. The results indicate that most cases of bronchopneumonia or lobar pneumonia can be treated adequately with 200,000 units of penicillin in water-in-oil emulsions once daily for five days In elderly patients or in cases with complications, injections were given twice daily for the first two days, then once daily The penicillin was continued beyond the five-day period when symptoms were slow in responding As in all infections, the quantity and virulence of the organisms and the resistance of the patient call for individual judg-However, it was felt that penicilin should be given in more than minimal quantities in all cases in order to take care of special circumstances

The following case illustrates that there was no difference noted in the response to treatment once or twice in twenty-four hours with the water-in-oil emulsion of penicillin as compared to treatment six or eight times a day with penicillin in aqueous solutions

Mrs R C, aged 55, previously had two attacks of pneumonia of the right upper lobe. The first time she was treated at home with sulfadiazine, to which she became sensitive. Following a second attack a year later, she was hospitalized and treated with 30,000 units of aqueous pencilin every four hours. Subsequently she had a third attack, with pain in the right upper chest, cough, rusty sputum, chills, and a temperature of 104 F. Physical examination revealed consolidation in the right upper lobe. She was treated at home with an initial dose of 200,000 units of pencillin in water-in-oil emulsion, and 100,000 units twice daily for three days, then 100,000 units daily for an additional four days.

She showed a satisfactory response in no way differ ent from that observed when she had been given accross penicillin during the previous attack.

The following 2 cases are illustrative of the efficacy of penicillin in water in-oil emulsion administered in doses of 200 000 units

T C., a 75-year-old retired printer, developed acute asthmatic bronchitts. Congastive cardiac fallure resulted from the infection and he developed hypostatic pneumonia. The patient was placed in an oxygen tent at home and treated with digitalis and aminophylline. Because of the critical condition of the patient 200 000 units of penicillin in water inclined mulsion were given intramuscularly twice daily for five days—the patient recovered completely

Miss A. B , 22 years old had a history of asthma since childhood. Desensitizing injections had been moderately effective in curbing her asthma but she would get periodic attacks that did not respond to epinephrine aminophylline potassium iodide cal cium gluconate intravenous glucose, massive doces of vitamin C barbiturates, or oxygen. In December 1945 she had an attack of status asthmaticus and was treated with all the above-mentioned measures without relief She had a wheeze that could be heard across the room and physical examination revealed marked evanosis and orthopnea. Her tem perature suddenly rose to 102 F and she developed a cough with a blood tinged sputum. A diagnosis of bronehopneumonia around the congested con-Injections of peni stricted bronchioles was made cillin, 200 000 units in water-in-oil emulsion once daily for five days resulted in recovery similar attacks of bronchopneumonia following asthma had previously required two to three weeks without the use of penicillin

Thirty-nine cases diagnosed clinically as follic ular streptococcie tonsillitis showed excellent recovery following treatment once daily with 200,000 units of penicillin in water in-oil emul sion. The fever subsided after twenty four hours in a majority of the cases When the exudate was moderate, a second injection was given when the exudate was bilateral or unusually ex tensive and thick a third injection was given Patients with a rheumatic history or stubborn cases with a heavily plastered exudate were given five injections. Penicillin did not appear to basten the relief of throat pain in these cases Aspirin and sodium bicarbonate gargles were used for symptomatic relief and to wash away mucous secretions

Nine cases from the preceding group had a rheumatic history and a persistent systolic apical murmur. In view of the history penicillin was given until no inflammation persisted and the organisms were destroyed as thoroughly as possible in order to decrease the effect of sensitising streptococcus toxins which are considered important in rheumatic fever flare-ups

Seven cases of typical pyelitis and fever kidney pain and pyuris were treated once daily with 200. 000 units of penicillin in water-in-oil emulsion One of these patients was a 33-year-old woman who developed a temperature of 105 F chills pain in the kidney region, and pyuria. A diagnosis of acute pyelitis was made She was given one injection daily of 200 000 units of penicillin in water in-oil emulsion for three days at home and for three days in the office. Her symptoms cleared up at the end of this period when x rays and eystoscopy revealed moderate hydronephrosis and a sterile urine Another case from this group was a 42 year-old man with a congenital cystic kidney. He had frequent recurrences of hematuria and pyuria with hydroand pyonephrosis \ mys showed each kidney to be the size of a grapefruit. Daily injections of 200 000 units of ponicillin in water-in-oil emulsion were given for ten days. The hematuria stopped after twenty-four hours. Although the pyuria decreased considerably in forty-eight hours, there was no further decrease in the pus cells at the end of the ten-day treatment period. It was felt that this was a mixed infection and that penicillin was effective against certain bacteria while others survived to continue the infection The other cases only required treatment for three days for the condition to subside

Six cases of sinusitis were treated once daily with 200 000 units of penicillin in water in-oil circulation. Five cases were given three injections while the other one received five injections. The results were good in 3 cases and fair in the other 3

Ten cases of acute otitis media were treated once daily with 200,000 units of penicillin in water in-oil emulsion. The cases showed bulging ear drums elevated temperature, and were concomitant with an acute upper respiratory infection as a rule. In 2 cases the drum ruptured spon taneously in no case did the drum require puncturing. One chronic ear infection was of special interest.

A 60-year-old woman was diagnosed at an eye and ear hospital as having a chronic masteld infection and chronic otitis media of two years duration. She refused hospitalisation and operation. Examination of the ear showed a profuse foul purulent discharge. She came to the office daily after work for twenty days and received 100 000 units of penicillin in water in-oil emulsion each day. Her condition cleared up and she has remained without an otitio discharge for eight months.

Five cases of scarlatina complications in child ren of 3 to 9 years old were treated Bilateral adentis developed between the third and tenth day of illness The condition appeared to be controlled by ice collars and daily injections of 200,000 units of pencillin in water-in-oil emulsion for three days No case formed an abscess or required incision.

Twelve cases of streptococcic asthmatic bron

chitis were treated with penicillin in water-in-oil emulsion Two cases, T C and A B, that developed pneumonia were previously described Of the other 10 cases, 6 were the status asthmatic type and were treated with 200,000 units of penicillin emulsion once daily for five days, the other 4 cases received the same dose for three days The response was favorable in all cases

All patients in this series were scratch tested for peanut-oil sensitivity prior to treatment other patient was not treated with penicillin in water-in-oil emulsion because of sensitivity to peanut oil

Five cases of extensive furunculosis were treated with 200,000 units of penicillin in waterin-oil emulsion once daily for two to seven days Results were fair to good

The following cases indicate that penicillin therapy may be carried out efficiently at home by the use of a water-in-oil emulsion of penicillin

One case diagnosed as appendicitis was treated A 52-year-old man had an abdominal pain radiating to the right low quadrant, his temperature was 100 F and he had a white blood count of 12,000, nausea, and slight diarrhea The patient refused hospitalization and operation because he had rheumatic heart disease with mitral stenosis He also insisted upon working as he was in the midst of an important job

He came into the office twice daily for three days and received 100,000 units of penicillin in waterin-oil emulsion at each visit. His symptoms subsided completely

Mrs C, a 57-year-old nurse, developed a paronychia of the right index finger The finger was incised and drainage, pain, local redness, and swelling persisted for two weeks Tenderness developed on the entire palmar surface of the finger A five-day course of sulfadiazine orally was ineffective The symptoms persisted and the skin became soggy and angry around the drainage site An x-ray showed osteomyelitis of the two terminal phalanges The patient was given 100,000 units of penicillin in water-in-oil emulsions twice daily for five days, whereupon the drainage ceased and the skin healed over

Nine months later recovery of function was com-This is a typical case of osteomyelitis, which plete in the past had required months of active treatment and often hospitalization and surgical intervention. now responding to penicillin twice daily for a period of less than a week

A 3-month-old infant with pharyngitis, temperature 102 F, was given sulfadiazine for four days without signs of improvement Since an infant is not a good candidate for multiple daily injections, one intramuscular injection of 200,000 units of penicillin in water-in-oil emulsion was given at home at 2 00 PM At 6 00 PM the same day, the mother telephoned that the baby's temperature was normal and the child was able to finish her first bottle in a week No further injections were required

A 14-month-old baby girl developed a septic arthritis of the right knee There was a temperature of 103 F, acute pain, and absolute limitation of movement of the knee A splint was applied and the child was given 200,000 units of penicillin in waterin-oil emulsion once daily for seven days Complete recovery ensued At the present writing, one year later, the child walks properly

A 65-year-old man, hemiplegic and bedridden, developed cholecystitis with a white blood count of 22,000 and a markedly tender upper-right quadrant Recovery followed two injections of 200,000 units of penicillin in water-in-oil emulsion given on successive days

Summary

- A series of 167 cases, including various acute infections, was treated, mainly at home or in the office, with intramuscular injections of penicillin in water-in-oil emulsion
- The extemporaneously prepared water-inoil emulsions were less expensive and simpler to use than the beeswax-peanut oil mixtures of penicillin
- Usually one injection of 200,000 units in each twenty-four hour period was given few instances, two injections a day were given
- In the author's experience, clinical results were as effective as those obtained by the use of penicillin in aqueous solution, injected every three or four hours

A SUMMARY OF BRONCHOSCOPY IN DISEASES OF THE CHEST

JAMES M BLAKE, M D, Schenectady, New York

(From Scheneciady County Tuberculous Hospital, Glenridge Sanatorium)

THE progress of medicine is primarily centered in newer methods of diagnosis and treatment as well as in improvement in the application of those methods previously used. The alert physician and patient of today more or less demand confirmatory diagnostic procedures in the arrival at the final diagnosis of any specific illness. The developments which have occurred in medicine in recent years no longer allow for the incomplete study of the individual patient.

Such improvements in diagnostic procedures, the ever-alert physician and the information available to the patient through the lay press even though frequently inaccurate have not only called for the accurate diagnosis and treatment of the patient, but at the same time have acted as a two-edged sword, leading to the unfortunate use and abuse of new diagnostic and therapeutic procedures by the unqualified individual, often unfortunately, for financial gain alone.

The economics of current medicine, however demand the fullest in estigation of any diagnostic problem at a reasonable cost and with full guidance provided by the specialist to the family physician

Bronchoscopy as a Diagnostic Procedure

Bronchoscopic examination is still considered by some as a "horrible' procedure. This is due perhaps, to two primary reasons first, because of the technic of the past, and second, because many physicians, and, perhaps it might be said the majority, have never seen a bronchoscopic exam mation or, if so one that was performed by an incompetent operator, clinging to the forceful technic of the past.

Today the bronchoscopic examination can no longer be rightfully called a 'horrible' procedure Cut lips, broken teeth hoarseness, and edema of the larynx are no longer seen. Likewize by the use of Jess toxic surface anesthetics we seldom see a cyanotic patient. The forceful holding of a patient in a neck-breaking position is not seen in the modern bronchoscopic clinic of today. With the modern technic, skillfully applied, the patient breathes perfectly normally and coughs only on request as a result of this the procedure is essentially attuamatic

Accordingly, the pathology and physiology of the tracheobronchial tree can be evaluated carefully and completely, not only by the operator, but by other observers as well. The examination may be carried on for a longer period of time, in fact as long as necessary in order to evaluate the findings. It is not uncommon to spend as much as fifteen to thirty minutes in a careful bronchoscopie examination and without question this is less trying to the patient than the hurried examination in the past of three minutes and certainly provides for more complete evaluation of the changes which may be present

A bronchoscopic examination today, properly performed, does not necessarily require hospitalization. It can be done as an outpatient procedure, and it is not uncommon in our clinic for a patient to have a bronchoscopic examination and return shortly to his normal employment.

It is obvious that bronchoscopy like any other technical procedure requires skill and experience, not only in the technic itself, but also in the evaluation of the findings as well

The bronchoscope provides for a simple speculum examination of the tracheobronchial tree with an obviously limited field of vision. This field of vision, however, is enhanced by the use of auxiliary scopes which provide indirect inspection allowing for examination of the division bronch, especially those of the upper lobes which are usually unseen with the standard bronchoscope. Such auxiliary aids have been so helpful that now a bronchoscopic examination is considered incomplete unless such is provided

Application of the Bronchoscope in Disease

A bronchoscope is used not only in the diag nosis and treatment, but also in the full evalu ation of the tracheobronchial tree. It cannot and should not be considered as a specific single procedure but as an auxiliary method used in arriving at the correct evaluation of possible pathologic changes in order that correct therapy can be applied

There are certain specific conditions which, when present in themselves, indicate bronchoscopic examination. The use of the bronchoscope in these diseases proves beyond doubt the tremendous value of the bronchoscopic examination, not only in aiding in making the diagnosis, but more importantly in determining the treatment and, therefore, frequently being responsible for the recovery of the fistient.

Beyond those specific diseases which call for

Presented before the Herkimer County Medical Society June 18 1946.

bronchoscopy as part of either the diagnosis or treatment, there are ceitain symptoms or signs which indicate bronchoscopic examination and which are of extreme importance to the physician Oftentimes a suspected diagnosis must be made based on subjective or objective symptoms which in themselves are not conclusive and frequently not considered significant until it is too late for curative treatment

It can be stated that any unexplained symptom relating to or originating from the bronchial tree should have bronchoscopic examination for full Specifically, some of the symptoms evaluation which when present should indicate bronchoscopy are, first, pulmonary hemorrhage symptom usually sends the patient to the physician, and frequently because no other symptoms or physical signs are present, the physician may pass the hemoptysis off with a "pat on the back" and assurance to the patient that it is probably from a vessel in his throat The patient may then return later with a hopeless cancer, tuberculosis, or other disease of the lungs, which in themselves cause hemoptysis

Wheezing is a symptom or sign which frequently represents serious pathology in the chest. It must be remembered that all wheezing is not asthma. The presence of this symptom or sign, particularly if it is unilateral and persistent, calls for bronchoscopic examination. Quite often the first sign of early carcinoma of the bronchus is a wheeze detected only on forced expiration.

Evidence of bronchial obstruction which may be detected frequently on physical examination by diminished breath sounds, or perhaps by slight impairment of resonance, may indicate partial bronchial obstruction and in itself calls for more complete investigation as to the cause

The presence of so-called unresolved pneumonia is a frequent forerunner of chronic pathology in the lungs. There is some doubt in the minds of many as to whether or not the diagnosis of unresolved pneumonia is ever correct. Those who have had experience in bronchoscopic work feel that when a condition presents itself, suggesting the diagnosis of unresolved pneumonia, this should be most completely evaluated. Here again there may be involvement of the bronchus with atelectasis, which is considered to be pneumonia not completely resolved.

Beyond these specific symptoms there are others, particularly those of nonspecific infections of the lungs which do not clear within the reasonable period of time expected for any nonspecific infection. Frequently, so-called chronic bronchitis and other symptoms of persistent nonspecific infection in the lungs are simply the fore-runner of more serious disease, and from our

experience it seems that patients who present this train of symptoms should be investigated much more thoroughly

Foreign Bodies—The use of the bronchoscope in the removal of foreign bodies from the bronchial tree is familiar to everyone. However, it should be emphasized that contrary to general opinion this use of the bronchoscope constitutes less than 5 per cent of the indications for bronchoscopic examination and in reality plays a relatively minor role as compared to its general use Bronchoscopic examination obviously is indicated in the aspirated foreign body suspected from the history and confirmed by \ray examination, but, most important, it is indicated in the unsuspected case

Postoperative Atelectasis —Postoperative atelectasis is a fairly frequent pulmonary complication following surgical procedure, and in such instances bronchoscopy can often be a lifesaving procedure

Postoperative atelectasis is often diagnosed as pneumonia, but it is generally recognized that true primary pneumonia occurring postoperatively is comparatively rare. The primary symptoms of elevation of fever to 101 F or more, and shortness of breath and cough, coming on approximately twenty-four to forty-eight hours after operation in an otherwise so-called clean case, frequently are due to obstruction of the bronchus and subsequent atelectasis

The surgeon should be constantly on the alert for this possible complication and the early application of treatment results in early recovery Postoperative at lectasis can be prevented in many instances by frequent changing of the position of the patient and encouraging the patient to cough and expectorate when mucus is present

Lung Abscess —Bronchoscopic examination is indicated at least once in every case of lung abscess and should be done as early in the course of the disease as possible, primarily for diagnosis and evaluation. A possibility of a foreign body, a carcinoma of the bronchus, or some other bronchial obstruction must be determined as the possible causative factor behind the abscess

The localization of the abscess in the segment of the lung involved and the relation of the bronchus draining the abscess to the main bronchus, as well as the degree of obstruction of the segmental bronchus due to inflammatory change and edema, is imperative for proper application and success of treatment by postural drainage. From our experience, hospitalization, chemotherapy, and diligent, properly applied postural drainage will be successful in the majority of cases. Where this is not sufficient, external surgical drainage is indicated. It seems, therefore, from our ex-

Fig 1

Fig 2.

perience that it is only in the occasional case of lung abscess that repeated bronchoscopy is indicated

Bronchiectans —The treatment of unilateral bronchiectasis is surgical resection of the infected lobe or lobes, but as in lung abscess, all such cases should have at least one bronchoscopic examination for the evaluation of the bronchial tree especially since foreign bodies polyps and other beingn obstruction to the bronchi may be the causative factor.

Bilateral bronchectasis or bilateral cystic disease of the lung which is inoperable, is oftentimes benefited by periodic bronchescopic aspiration of the bronchial tree Although such a procedure is in no way curative, the relief of symptoms frequently is sufficient to cause the patient to return requesting periodic aspiration

Bronchogenic Tuniors — The use of the bronchoscope in the diagnosis of carcinoma of the bronchus has been emphasized widely during recent years so that it is non well recognized as an important adjunct in any patient suspected of having such a carcinoma. It has been stated that from 75 to 90 per cent of all the cases of bronchogenic carcinoma are positively diagnosed by bronchoscopic biopsy However it must be pointed out also that the majority of cases of carcinoma of the bronchus diagnosed by bronchoscopy are usually inoperable. What does this

mean? Simply that now that we have learned the value of positive bronchoscopy in making a diagnosis of caucer of the bronchus we must likewise learn that a negative bronchoscopy is valuable in the treatment of cancer of the bronchus

In other words, bronchoscopy is an adjunct in arriving at the diagnosis of bronchogenic carcinoma and must be done early and often repeatedly and the findings considered at their face value in arriving at the final diagnosis. Although bronchoscopy is important in cancer of the bronchus and indicated in every suspected case, we cannot wait for a positive biopsy and expect that the patient will still be operable

It should be emphasized that the masculine patient, forty years of age or over, with an atypical pneumonia unilateral wheezing, or a persistent cough deserves an x-ray examination and the presence of x-ray shadows which cannot be specifically interpreted should be studied thoroughly for the possibility of cancer of the bronchus

Figure 1 shows carcinoma of the left main stem bronchus, diagnosed by biopsy obtained at bronchoscopy but inoperable because of the extent of the process and the metastasis present Fig 2 shows carcinoma of the bronchus not seen at bronchoscopy but which proved to be cancer of the lung at operation and by pathologic examination of the lung after removal.

There is a second type of tumor of the bronchus seen fairly frequently but practically always in women. That is the so-called benign adenoma. Such tumors are diagnosed generally at bronchoscopy and sometimes may be treated by fulguration through the bronchoscope. It is preferable, however, if location of the tumor permits, that a lobectomy be done masmuch as these tumors most always extend through the wall of the involved bronchus and, therefore, tend to recur if not completely removed.

Pulmonary Tuberculosis—The bronchoscope undoubtedly has its widest indication, and perhaps its greatest value, in the modern concept of the diagnosis and treatment of tuberculosis of the lungs, and it will continue to play a most important role in this disease until a specific chemotherapeutic or antibiotic agent for tuberculosis is discovered. Undoubtedly, even then it will continue as an important phase in the correct evaluation of the disease

Tuberculosis of the major bronchi is a serious complication of pulmonary tuberculosis, and it affects gravely the prognosis of the case

The evaluation of a case of tuberculosis, especially as related to surgical treatment, calls for bronchoscopic study of the bronchial tree. This can give valuable information when tuberculosis of the bronchi is present. Such examination can determine whether or not the disease is active and, if so, whether it is hyperplastic, ulcerative, or inflammatory, whether it is inactive and the extent of fibrostenosis which may be present. It also can determine the probable change or eventual change in lung damage and function.

Bronchoscopic examination not only aids in the diagnosis and the location of the disease present, but also in the character of the disease Repeated bronchoscopic examination provides information so that one can determine accurately the probable outcome of the individual case. As an illustration, if the extent and course of the disease results in obstruction of the bronchus, we know that obstructive emphysema, atelectasis, and bronchiectasis eventually will result. Repeated bronchoscopies, therefore, are necessary in the therapeutic program of pulmonary tuberculosis

Bronchoscopic examination in tuberculosis also oftentimes aids in the treatment. It is well recognized that the outcome of endobronchial disease is in direct relation to the pulmonary disease

Repeated bronchoscopic examination and the application of silver intrate, where and when it seems indicated, has helped in determining the type of therapeutic program indicated as well as when such a program should be adopted. Fig 3 shows a patient with tuberculosis of the left lower lobe bronchus as determined by bronchoscopy. X-rays over a period of time show

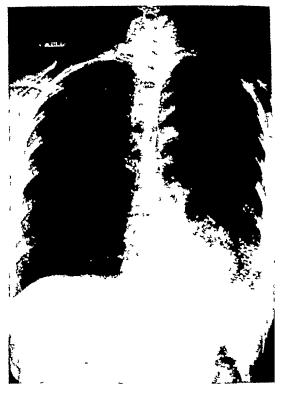

Fig 3

gradual developing atelectasis of the lobe. At the opportune time lobectomy was done with complete removal of this essentially destroyed lower lobe

Summary

In summation, it seems reasonable to state that bronchoscopic examination is an auxiliary method for more complete examination and evaluation of diseases of the lungs It is indicated in any case in which there is suspicion of pathology in the tracheobronchial tree Bronchoscopic examination should be considered where pulmonary symptoms show tendency to persist beyond the expected time, or where symptoms occur which cannot be explained definitely As it is now performed in the modern bronchoscopic clinic, the examination is essentially an atraumatic procedure which disturbs the patient to the minimum and which no longer can be looked upon as a "horrible" procedure

It is evident that the use of bronchoscopic examination is extremely important to the physician in aiding in the guidance of treatment of the specific patient. Although it may not be available in each small locality, the examination should be, and, in most instances, is available within a reasonable distance, so that the patient of today can receive this valuable adjunct as part of diagnostic procedure

BENADRYL*

A Synthetic Antihistamine Compound for the Symptomatic Treatment of Allergic Diseases Laurence Farmer, M D , and Henry Spickschen M D , New York City

(From the Allergy Clinic, Lenox Hill Hospital)

THE histamine theory of anaphylaxis and L allergy 1,2 presupposes that the symptoms of the anaphylactic and allergic reaction are the symptoms of histomine intoxication According to this theory the union of the anaphylactic or allergic antibody with the corresponding antigen or allergen leads to cell lesion and the consequent liberation of preformed histamine from the tissues, the liberated histamine in turn is responsible for the majority of the anaphylactic or allergic mani festations There has been considerable controversy concerning the validity of this theory Without reviewing the pros and cons. may it suffice to recall that it has been made the basis of attempts to further the understanding and treatment of allergic diseases.

If it is correct that the symptoms of these diseases are caused by the pharmacologic effects of histamine liberated from the tissues it should be possible to combat these diseases by offsetting the actions of histamine Conversely if measures aiming at counteracting the actions of histamine were successful in the treatment of anaphylactic and allergic phenomena this would constitute additional indirect evidence of the correctness of Dale's theory

An attempt at causal therapy of allergic diseases based on the histamine theory utilizes the possibility of inducing refractoriness to histamine through the chrome administration of small doses of this pharmacon. It should further be possible to achieve symptomatic relief by the use of drugs which possess the faculty of decreasing the effects of histamine on the ussues.

In a search for drugs with such primary antihataminic properties Bovet and Staub and
Staub's tested a large number of compounds syn
thesized by E. Fourneau Two of these, 929 F
(2-isopropyl-5-methylphenoxyethylamine) and
1571 F (n phenyl-n ethyl n' diethylethylenediamine), were found to alleviate histamineinduced bronchoconstriction and anaphylactic
shock in guinea pigs and to prevent the histaminecontraction of intestinal muscle in vitro. Their
toxicity however precluded their clinical use
Halpern in 1942 reported the synthesis of an
tergan (n-dimethylaminoethyl-n benzyl-amline)
a nontoxic homologue of 1571 F. Encouraging
thorapeutic results from its use in various aller

gic diseases were reported by Decourt * Parrot * Celice, Perrault, and Durel * A further group of lustamine antagonists was synthesized by Mayer, Huttrer, and Scholz * One of these drugs, pyri benzamine (n'-pyridyl-n' benzyl n-dimethyl ethylenediamine monohydrochloride) was found by Arbesman and Koepf'e to be effective in a number of allergic conditions

This report deals with our experiences with benadryl (beta-dimethylaminoethyl benzhydryl ether hydrochloride), one of a group of benzhydril alkamine others synthesized by Rieveschl and Huber and found by Loew and his collabora tors 11 12 to possess antihistaminic actions pharmacologic and toxicologic studies (Parke, Davis and Company Research Laboratories) no toxic effects were noted when it was administered orally to dogs in doses of 10 to 60 mg per kilogram of body weight for a period of thirtyseven to forty nine days Chnical observations on the use of benadryl in allergic diseases have been reported by Curtis and Owens 13 and by members of the Mayo Clinic in a symposium on benadryl 14-18 These authors found it to be effective in the symptomatic treatment of urticaria, angioneurotic edema, hay fever, vasomotor rhinitis, and physical allergy. Its usefulness in bronchial asthma was less well established

The prevention or mitigation of smooth muscle contraction induced by histamine into action or anaphylactic shock was the experimental or terion for an antihistaminic compound. Evidence that these compounds would also mitigate allergic phenomena due to increased capillary per meability and increased glandular secretion which probably are due to the liberation of histamine from the tissues, would indirectly further establish their histamine antagonism

Therefore, we were especially interested in studying the effectiveness of benadryl in conditions such as hay fever, allergic rhinitis (seasonal and perennial), urticaria and angioneurotic edema. We have also used it in patients suffering from bronchial asthma allergic cough and dermatitis.

The mechanism by which antihistaminic drugs mitigate the effects of histamine on the tissues has not been established. As far as is known, they do not prevent its liberation from the tissues, nor do they induce refractoriness to histamine. Their action, therefore is purely symptomatic.

This paper was prepared for publication in February 1946.

In view of this fact we administered benadryl only where allergic symptoms were present. We did not attempt to use it prophylactically, although this would be permissible in conditions such as seasonal hay fever

Benadryl was given orally in adults in doses of 50 to 60 mg one to three or four times a day Occasionally, 100 mg were given in single doses The average daily dose was 50 mg three times a not infrequently smaller amounts were sufficient to control symptoms In some instances 150 mg have been given daily for a period of sixty to eighty days Children under 10 years of age were given 20 to 30 mg one to three times a The onset of relief from symptoms was from twenty to sixty minutes, and the duration of this effect was from two or three to twentyfour hours, depending on the severity of the patient's symptoms The relief experienced varied from slight alleviation of symptoms to complete cessation

Results

Forty-three patients suffering from symptoms of pollinosis were given benadryl for the symptomatic relief of symptoms during the summers of 1944 and 1945, three of the patients received it both years Thirty-three of these patients had only ocular and/or nasal symptoms, 4 suffered additionally from bronchial symptoms, 6 had bronchial symptoms only In appraising the results of the benadryl treatment of pollinosis we are dealing, therefore, with a total of 45 "cases" Of these, 23 had marked relief from symptoms. in 11 the therapeutic effect was fair, and the remaining 11 were not all benefited Of the 10 patients who suffered from bronchial symptoms, 5 had good relief, 4 were not relieved, and in one patient there was a fair result

Of 17 patients with perennial allergic rhinitis due to allergens other than pollens, 9 had marked relief, in 1 case the result was fair, in 7 it was poor

Twenty-three patients suffered from urticaria, 4 of them also had angioneurotic edema result in this group was very remarkable in that only 1 patient was not benefited. All the other patients were very markedly, often dramatically, relieved from frequently very severe pruritus It is interesting that in the majority of these cases the hives persisted although the itching subsided Two patients who had angioneurotic edema were also relieved from the pruritus Of 6 patients with dermatitis, 5 had very good relief from pruritus In 2 cases of pruritus of unknown origin, 1 case showed marked improvement patients with allergic cough were greatly bene-Eighteen patients with bronchial asthma were given benadryl, 13 of them had good relief

TABLE 1

	Number		–Results–

Angioneurotic edema	2	2	0	Ō
Dermatitis	6	5	0	ĺ
Bronchial asthma Pruntus (unknown	18	13	1	4
etiology)	_2	1	0	1
Total	113	75	13	25

from symptoms Our therapeutic results are summarized in Table 1

For the purposes of this study benadryl was administered only if allergic manifestations were present, and the patients were usually instructed to take further doses only as needed. We feel that it might be advisable to use benadryl more regularly in certain conditions, e.g., in hay fever when it could be given two to three days before the expected onset of symptoms, and, if well-tolerated, 50 mg three or four times a day could be taken during the entire pollinating period

Side-effects

Approximately one third of the patients experienced side-effects. The majority of these patients complained of drowsiness, which in some instances was very strong. Next came dizziness of slight degree Two patients complained of unsteadiness in walking A few patients felt nervous or "jittery" Four had a burning sensation in the mouth, throat, or stomach Two complained of dryness of the nose, tongue, and throat. In one instance the patient's tongue became very red and sore so that medication had to be dis-In the latter case it was possible to administer benadryl again after a period of two to three weeks This patient had such marked relief from severe rhinitis that she wished to use the drug in spite of the tongue symptoms Although the side-effects generally were not felt to be very disturbing, a few patients refused further administration of the drug in spite of relief from allergic symptoms There was no clear relationship between the occurrence of side-effects and the amount of the dose or the length of administration. Some patients had marked subjective complaints after small doses, others tolerated large amounts well Generally, however, larger doses were not as well tolerated as smaller ones No serious side-effects were noted in larger doses

Summary and Conclusions

1 Based on the assumption that the symptoms of allergic diseases are due to histamine intoxication, a new type of synthetic drugs with antihistaminic actions has been introduced in the symptomatic treatment of these diseases

Benadryl, a representative of this type. has been used by us in 108 allergic patients Sevents three of these patients were markedly relieved from symptoms. Side-effects, mainly drownness and dizziness, were experienced by approximately one third of the patients

3 Antihistaminio substances undoubtedly have a place in the therapeutic armamentarium of allergic diseases The search for drugs with fewer side-effects should be continued

DOCTOR CLAIMS THERE ARE TWO TYPES OF VENOUS THROMBOSIS

Venous thrombosis, a condition in which the blood clots in the veins is of two types—thrombophlebitis and philebothrombosis according to Alton Ochaner M D, of New Orleans. He states that unless there is a differentiation between the two treatment is 'likely to continue to be unsatisfactory

Writing in the December 7 issue of the Journal of the American Medical Association, Dr Ochaner points out this difference The blood clot in thrombophlebitis is the result of inflammatory changes and is firmly attached to the vein wall the blood clot in phlebothrombons is the result of tissue injury and can become detached easily from the vein wall Thrombophlebitis usually can be diagnosed easily

from symptoms such as fever pain, and swelling. The patient's chances of recovery are good, but if he does not receive effective treatment, complica tions such as swelling pain ulceration of the legs

and infection may develop

In contrast, patients with phlebothrombons al though apparently not ill, are potential fatalities be-cause of the danger that the clot will become detached and be carried by the blood stream to the

lungs where it may act as a plug and cause death.

Phlebothrombosis is caused by two things—an increase in the ability of the blood to clot due to tissue injury and a slowing of the flow of blood as a result of the patient s being confined to bed or having a leg in a cast.

Early detection of this condition is possible if the patient is examined for tenderness of the legs follow ing any tissue damage such as an operation.

Dr Ochsner states that there is a definite rela tionship between venous thrombosis and the seasons. This has been pointed out by several other investigators. One of these found the greatest incidence of thrombosis from December to February He believes that grippal infections are responsible for this difference

Another group of investigators reported that in a series of 832 cases thrombosis was observed in 82 9 per cent in the winter 21 9 per cent in the spring, 18 9 per cent in the summer and 20.8 per cent in the fall.

It is my belief that the increased incidence of venous thrombosis during the winter months is due to the vasospastic (causing contraction of the blood vessels] influence of the cold weather states the This explains the difference between the incidence of venous thrombosis observed in the northern and in the southern clinics. My associates and I showed that the incidence of venous thrombosis in the northern clinics was almost double that in the southern clinics. The average incidence in the northern states was 0.74 per hundred thousand population as contrasted with 0.41 in the southern states.

Soveral suggestions are made by Dr Ochsner which if followed, he believes should prevent the formation of clots in the veins. He says that pa tients should refrain from smoking for a period of from 10 to 14 days before an operation overweight patients should reduce before undergoing surgery any abnormal state of the blood, such as anemia, should be corrected. After the operation the author favors leg exercises and deep breathing to increase the circulation.

For the treatment of thrombophicbitis the author suggests the use of a local anesthetic procaine hydrosuggests the the or a local season of the control of the perature falls rapidly and the swelling subsides with an a few days, he writes. My experience has shown that the relief of pain is complete and permanent in 90 per cent of the patients, whereas in 10 per cent a second block [of the local involuntary nerve centers] is necessary to give permanent relief.

Dr Ochsner recommends immediate surgery as soon as phlebothrombosis has been diagnosed. He does not favor widespread use of anticoagulants such as heparin and Dicumarol because, although they will prevent further clotting of the blood, they will not prevent the detachment of the clots already formed

THE PERORAL REMOVAL OF CERTAIN SWALLOWED FOREIGN BODIES WITHOUT ENDOSCOPY

Introducing a New Device Utilizing the Alnico Magnet

Samuel Silber, MD, and Bernard S Epstein, MD, Brooklyn, New York

(From the Departments of Pediatrics and Roentgenology of the Jewish Hospital)

CWALLOWED foreign bodies require medical attention if they are deemed potentially dangerous, for example, pointed or excessively bulky objects, particularly when impacted, obstructed, or overlong delayed in their onward passage through the digestive tract dangers of erosion, perforation, or edema from foreign bodies in the esophagus necessitate their immediate removal as soon as the knowledge of their presence is established Foreign bodies in the stomach may be allowed a reasonable time to pass, if they remain excessively long, however, (over ten days according to Jackson) or if the hazards of passage seem to outweigh the dangers of intervention, measures should be taken for their removal The size of the object in relation to the curves and constrictions in the food passages, especially in children, may be the determining factor influencing the adoption of measures for removal Unfortunately, there has been no simple procedure short of either laparotomy or endoscopy for the removal of ingested foreign bodies from the esophagus or stomach

Our introduction of the "alnico" magnet in 1943° for magnetically coercible swallowed foreign bodies achieved some degree of simplification, limited to this special group of objects eighteen months later duplicates of our original magnet, with essentially the same technic, were successfully used by several others in cases involving swallowed bobby pins and safety pins, and one report recording such success has recently appeared in the medical literature ever, the problem of affording the tissues protection against injury during withdrawal of the foreign body and of preventing unintentional release into either the food or air passages, while dispensing with endoscopy, was still to be solved A review of our original case and the 2 subsequent cases, herein reported, employing a new apparatus will indicate how this was done 45 Since the first published case our desire to simplify and improve the procedure has led to several inno-The difficulty in getting foreign bodies vations beyond the cardiac sphincter and the higher points of constriction of the esophagus, especially the cricopharyngeus, has now been overcome without resort to endoscopy By providing a sheath-like tube in which the magnet, attached to the Levine tube, can move freely, it is possible to withdraw straight objects with ease and safety. This is accomplished by making contact with the object, drawing it into the sheath, and then removing the entire apparatus with the foreign body snugly encased within the sheath. Protection against the foreign body is thus afforded the food passages, and the danger of its release into the air passages avoided.

A piece of rubber tubing, 0.7 meter long, such as that used on enema cans, may be employed to serve as the outer tube or sheath Our original apparatus, the Levine tube, stiffened to permit manipulation, with four lengths of piano wire coursing through the lumen and attached to the magnet, serves as the inner tube Before use, the sheath is lubricated with mineral oil and the Levine tube bearing the magnet is inserted, the tip of the magnet being allowed to protrude about 2 cm beyond the distal end of the sheath (Fig 1) A duplicate of the ingested foreign body, previously tested for magnetic attraction, is used during a practice test to note the relative ease or difficulty to be expected in removing the actual The sheathed magnet is passed into the stomach of the patient, who is under moderate sedation but no anesthesia, and contact is estab-The Levine tube is lished with the foreign body then withdrawn gently until the foreign body lies within the sheath, whereupon the entire apparatus is withdrawn from the stomach with one This method was first attempted by one of us (S S) as an office procedure with the However, hospital aid of regular office help equipment, together with the practiced teamwork of an experienced roentgenologist, are to be preferred

Magnetically coercible straight pins, corsage pins, hat pins, paper clips, hair pins, bobby pins, screws, nails, and safety pins are among the familiar swallowed objects encountered which lend themselves to this procedure. Even open safety pins may be caught by the curl and brought into the sheath, thereby insuring the tissues effective protection against the point on withdrawal from the esophagus, as well as avoiding the possibility of release of the foreign body into the trachea. If any but the desired part is caught by the magnet, contact can be broken and reestablished again and again until the desired presenting part is attracted.

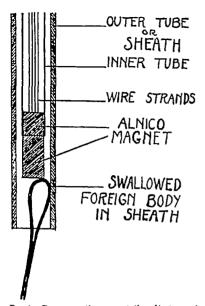

Fig. 1 Diagrammatic representation of instrument and attached foreign body

Case Reports

Two illustrative cases are presented from our series demonstrating the procedure

Case 1 -Susan S a 4-year-old girl was referred for removal of an ingested foreign object, supposedly a heavy straight pin which had been swal lowed one week prior to admission A duplicate of the pin was procured and this proved to be marneti cally attractable. An x ray film showed the object to be in the stomach. The patient was given preoperative preparation including sedation with atropine and phenobarbital and prohibition of food and drink Fluoroscopic examination after manipu lation with our magnet and an x-ray taken in the Hospital showed that the object was a paper clip erroneously thought to be a pin because the first x ray had caught a side view of the object Fortunately the paper clip too was magnetically as attractable as the spurious duplicate pin After the sheathed magnet was passed into the stomach, contact was established with one end of the clip The protruding magnet was then gently withdrawn into the sheath carrying the paper clip along with it. The large ensheathing tube, with its contents, was then removed perorally in one quick motion The entire procedure was accomplished in about three minutes and the child was discharged from the hospital in perfect condition immediately thereafter

Fig. 2 Spot roentgenogram showing actual operation of instrument in Case 2

Case 2 —Jane C., a 3-year-old girl was admitted to the hospital for the peroral removal of a bobby pin which had been swallowed three weeks prior to admission

A duplicate bobby pin showed magnetic attraction existed. One-half grain of nembutal and '/is of a grain of atropine had been administered by suppository to avoid giving anything by mouth two hours before beginning the procedure. The sheathed magnet was passed into the stomach without difficulty despite the child's age and avoidance of anesthesia. Some unavoidable retching instead of interfering with the procedure was helpful because it forced gastric fluid out of the ensheathing tube thereby further emptying the stomach.

The magnet protruding beyond the lip of the sheath, was brought into contact with the curved end of the bobby pin which was then guided into the sheath. A spot roentgenogram was taken and the entire apparatus removed perorally (Fig 2). The complete procedure was accomplished in about three minutes. The bright, cooperative and unfrightened little girl was then discharged to her home.

Summary

A simple apparatus utilizing a sheathed almico" magnot, is described for the peroral removal from the stomach and esophagus of straight magnetically coercible foreign bodies,

including straight pins, corsage pins, paper clips, bobby pins, safety pins, nails, screws, etc

This method substitutes for endoscopy a relatively harmless and easy procedure, which, nevertheless, affords protection to the food passages and avoids danger of release of the foreign body into the food or air passages

"DOCTOR JONES" SAYS-

The dean of one of the medical colleges was quoted, recently, as saying that, the way specializa-tion in medicine is increasing, the day of the family doctor is rapidly passing. I'd hesitate to question the opinion of a man in his position but I hope he isn't right. In fact, I've got a feeling that, ten or fifteen years from now, family doctors'll rate higher than they do today

When I was a boy we had a lot of old-fashioned furniture that'd belonged to my grandmother among other things, a mahogany highboy The women'd go up to the furniture store and look at the newfangled stuff and come back with tears in their eyes "All this old stuff!" somebody'd say, "we can perfectly well afford furniture that's new and up-to-date" So, finally, they made the change Today the old highboy that they sold for four dollars the president of the bank's got it in his

parlor-wouldn't take two hundred for it Because the folks that had 'em didn't appreciate their

value, there aren't many of 'em left
Most every medical student—it's his ambition to specialize some time. A successful specialist—he gets more money for less work. He can see people

by appointment only—and, some of 'em, you have to make an appointment a couple of weeks ahead If it's gizzards he specializes on, he knows gizzards from A to Z. When he's needed, he's well worth his

Out in Henry Ford's plants, so they tell me, most everybody's a specialist nuts, fenders, motors, and all the rest But, if my car don't run right, I want a general mechanic that knows cars If he needs the advice of a nut specialist, I'll leave that to him

A good general practitioner—he probably knows less about gizzards than the gizzard specialist but more about human bodies and ailments as a whole He knows his patient, his pecularities, and his environment, and his patients know him You don't have to make an appointment a week ahead to see him and he knows when to call a specialist if he's needed

In time folks'll realize that they need less specialists and more general practitioners. They can save 'emselves a lot of inconvenience and regrets by waking up to it now While they've got family doctors they'd better hang on to 'em.—Health News, March 24, 1947

POSSIBLE DANGERS OF TETRATHIONATE THERAPY OF THROMBANGIITIS OBLITERANS

Gilman and his associates1 present two possible theories to explain the severe nephrotoxic action of tetrathionate (1) Tetrathionate selectively permeates the cells of the proximal tubule to evert a direct toxic action on catalytic systems dependent on the presence of—SH, or (2) the cells of the proximal tubules are selectively damaged by the removal of diffusible—SH compounds

As an explanation of why toxic effects have not been reported in human beings treated with tetrathionate, Gilman points out that most commercially available tetrathionate contains large amounts of thiosulfate and that the recommended doses are low Nevertheless, the importance of maintaining the in-

tegrity of the—SH group in the body has been emphasized by recent studies on arsenic and mercury poisoning, and any drug which has potentialities for the destruction or interference with these groups must be considered as toxic and its use must be carefully limited Moreover, the substantial evidence of nephrotoxic effects from the use of tetrathionate furnishes a convincing reason that the use of this agent in medicine should be abandoned —Council on Pharmacy and Chemistry, JAMA, March 8, 1947

CLINICAL USE OF VITAMINS E AND C

JOHN R WILLIAMS, M.D., Rochester, New York

LARGE number of individuals suffer from A illness and physical incapacity which persist in spite of conventional treatment. The causes of many of these deabilities are unknown may be conjectured that some of them are on an infectious basis, others may be metabolic or physiochemical disturbances no clearly under stood Still others may be due to chronic food or vitamin deficiencies or possibly one or more of these factors may be combined.

Recently, it has been suggested that many muscular pains! of long standing may be due to chronic deficiency of vitamin E whether by failure to absorb or failure to receive this vitamin

from the diet.

The effect of minor deficiencies of very long duration has not been appreciated. Only recently has it been revealed that persons in chronic ill health show a general reduction of oil soluble vitamins in the plasma fraction of the blood *

With these considerations in mind it was thought dearable to try the effects of vitamins E and C* on a number of nationts, who were suffering from long persistent disorders of miscellaneous origin and character, the causes of which were not manifest, and who had however, these two important points in common a reduction or displacement of diet over a long period and muscular pain or aches, also of long duration

In this experiment 41 such individuals were subjected to the long-continued use of the vita mins E and C These patients may be grouped as follows

- Those with diabetes complicated by persistent pain in the arms or legs or both usually worse at night
- 2 Nondiabetic individuals with similar Dains
 - Those with diabetes and osteoarthritis 3
- Nondiabetic individuals with arthritis and Heberden's nodes

There was also a small group of miscellaneous maladies of unknown origin, long resistant, and unrelieved by conventional treatment. Termi nal arteriosclerotic disease, allergies, and fat dystrophy were the dominant physical signs of this group which was used mainly for control purposes.

Method

Each of these individuals was given at break fast a polyvalent preparation which contained the accepted minimal daily requirement of vita mins A, D, C, and B At noon each was given 25 mg of vitamin E and 50 mg of vitamin C. and at the evening meal 40 mg of the natural mixed tocopherols. This dose represents a trebling of the estimated normal daily intake of vitamin E The dose, however, is much smaller than the curative dose often recommended (100 to 300 mg per day) 4 5 The treatment was con tinued in each case from one month to a year or more Routine clinical observations were made at monthly intervals or more often when indi cated

In the group with diabetes plus neuromuscular pains, 20 cases were observed. Of these, 4 obtained definite but not complete relief, while in 5 cases there was complete relief of longstanding pain. In 11 cases the results were either negative or so slight as to be doubtful Whether these cases will respond to larger doses is not yet known

In the second group of nondiabetics with similar nerve muscle pain there were 6 cases In 2 of these the results were negligible, while in 4 cases the relief of pain was definite

In the third group (diabetes complicated by arthritis) there were 4 cases, 2 of which obtained no relief, while 2 claimed diminution of pain

In the fourth group of 5 cases with arthritis and Heberden's nodes or enlarged finger joints. 3 cases were not benefited, while in 2 cases the symptoms definitely subsided

Summary

In the experimental series there were 35 individuals suffering from illnesses, in most instances of several months or years' duration, characterused by pain which seemed to be related to the neuromuscular system. A number of these secured partial or complete relief from nam apparently from the addition of special vitamin preparations to the diet.

In some carefully controlled cases, the relief obtained was so dramatic and sustained as to afford highly suggestive evidence that the mixed tocopherols plus ascorbic acid have helpful thera peutle properties In a number of similar cases the relief from pain, although positive was only

Ascorbic acid was included because it, with tocopherois is responsible for the chamical reducing power of the blood.

bility of further study and possibly treatment with larger doses

The main purpose of this brief report is to call attention to the tocopherols as possible factors in certain obscure neuromuscular disturbances, which cause both pain and disability. It can scarcely be questioned that these painful neuropathies associated with diabetes are among the baffling mysteries of medicine And while, of course, it has not been established clearly, it is a reasonable hypothesis that the underlying cause is a deficiency disturbance. The use of large doses of vitamin B has yielded variable but usually disappointing results 67 The fact that a small but significant proportion of these patients has been benefited from moderate therapy with vitamin E suggests that deficiency of this vitamin may be one of the accountable factors in muscular pain

STILL DIFFICULT TO APPRAISE VALUE OF BCG VACCINE FOR TB

The results of the use of BCG (Bacille Calmette-Guérin) vaccine as an immunizing agent in tuberculosis are influenced by so many factors, says an editorial in the November 9 issue of the Journal of the American Medical Association, that "accurate evaluation is still difficult"

"All reports agree that the vaccine properly prepared and used is harmless, as cases of tuberculosis caused by BCG vaccine have not been reported thus far "

The Journal's editorial, entitled "BCG Immunization," follows by only a few days the US Public Health Service's announcement from Washington that the vaccine, which has been available in Europe since about 1920, will be given widespread studies in this country

BCG is named for two French scientists. Calmette and Guirin, who developed it at the Pasteur Institute in Paris

The decision to make a wide-scale study in the United States of the effect of the vaccine in man was reached after a conference in Washington of tuberculosis experts from China, Denmark, and the United States It has already been used on test groups in Chicago and New York and on western Indian reservations, as well as in Europe and South America.

The Journal's editorial says in part

"Holm of Denmark states that since 1940 vaccination with the bacillus of Calmette-Guérin has been adopted in that country as an essential weapon in the fight against tuberculosis. A large part of the young people of Denmark are tuberculin negative Since it is known that tuberculin-negative persons acquire tuberculosis much more readily when exposed, BCG vaccination is believed to be a valuable adjunct in the control of tuberculosis

"The Tuberculosis Dispensary of Copenhagen re-

ports that morbidity and mortality from tuberculosis among the children in a tuberculous environment have been reduced following vaccination to almost zero Previously mortality among children exposed to tuberculosis in their homes was high, but in recent years children thus exposed have not died of tuberculosis, and children who become ill have a much milder form of tuberculosis than previously Holm concludes that BCG vaccination observed gives considerable, although not absolute, protection

"The allergy produced by the vaccination lasts more than three or four years In the health department of Bergen, Norway, among 4,400 persons vaccinated who were observed up to three years only one developed ulcerative pulmonary tuberculosis and 11 developed tuberculosis of the hilar lymph nodes The National Society Against Tuberculosis in Nor-

way favored mass vaccination in 1945

"Levine and Sackett, reporting the results of BCG immunization in New York City, assume a more conservative attitude. Although most reports have been optimistic, they feel that the vast majority of these studies have been inadequately controlled

"The authors point to a number of factors which could affect the comparative results, such as parental cooperation, economic conditions, racial distribution, exposure, and lost cases

"The efficacy of BCG vaccination must be judged by its ability to reduce the tuberculosis mortality of children vaccinated in their homes in the midst of a tuberculous environment The authors conclude that as a public health measure the routine vaccination with BCG of children from tuberculous homes is less advantageous than removal of the tuberculous subject from the home "

TROPICAL DISEASES FOUND IN VETERANS

HOWARD B SHOOKHOIF,* M D, and WHEELAN D SUTLIFF, M.D, New York City

(From the Tropical Disease Diagnostic Service Health Department City of New York)

THE last two years have witnessed the publication of a number of articles describing the tropical diseases which might be encountered among members of the armed forces after their return to civilian life. Demobilization is now nearing completion and so the problem of tropical diseases among veterans has become a reality for the civilian physician. During 1945 the Tropical Disease Diagnostic Service of the New York City Health Department examined 272 vetorans The following summary of our findings gives an idea of the types and the frequency of the so-called tropical diseases encountered among men and women discharged from the armed forces.

Most of these 272 veterans were referred to the Service by their own physicians or by one of the veterans' counseling services. They had served in all parts of the world. The numbers serving in the various theatres of war were as follows.

Tropical

Pacific area including New Guinea 147
(Varrous small islands the Philippines, Japan)
Afro-European Theatre (Most served in both Africa and Italy)
China, Burma and/or India 22
American Theatre, including West Indies Panama, South America
Nontropical
U.S.A. only (Southern U.S.A. 11) 19

U.S.A. only (Southern U.S.A. 11)

Australia

Europe

5

Region of service not known

13

Total

The total exceeds the actual number examined, since in three instances the men saw service in two theatres. Slightly more than half of those examined served in the Pacific area. The vast majority were, of course, in the Army

The most frequent reason for which we were consulted was a history of malaria. The veteran desired advice and check up following one or more attacks. The commonest symptoms for which service was sought were. (1) diarrhea and other gastrointestinal complaints. (2) fever, with or without chills. (3) skin eruptions. (4) previous history of diarrhea amebic dysentery or worms, (5) the suspicion of or history of, filariasis.

The frequency of various reasons for consulta-

Miscellaneous complaints	29
Routine examination for tropical disease	6

In 11 cases the patient had two reasons for In 141 instances no diagnoses consultation were made, but in 116 of these, tests were done to rule out tropical infections and were negative As might have been expected, not all the veter ans had tropical or parasitic diseases. The following cosmopolitan conditions were diagnosed pulmonary tuberculosis, syphilis once each asthmatic bronchitis influenza, Vincent's stomatitis scables, impetigo contagiosa, and obesity It is important to keep in mind that those who have been in the tropics need not suffer from the so-called tropical diseases. Even if they have acquired their disease in the tropics, it may be one of the so-called cosmopolitan diseases

Diagnosis of a tropical disease was made in 119 patients. In a few cases the same patient had two or more diagnoses. The findings were as shown in Table 1

TABLE 1

Diagnosis		Cases
Malaria		38

Giardiasis		3
Bacillary dysentery		1
Total		130

Malaria

Of the 38 patients with malaria, 33 had served in the Pacific theatre 4 in Africa and/or Italy and one in the China Burma India theatre

^{*} Epidemiologist in Tropical Discasse, Bureau of Preventable Discases.

[†] Assistant Director Bureau of Laboratories.

The diagnosis of malaria was made by means of a blood smear in 37 of these veterans. In 36 the parasite found was Plasmodium vivax. In one instance only ring forms were present and a positive species identification could not be made. There were two instances in which the first film done by our laboratory was negative and a second one several days later was positive. In a number of other instances films done by the referring physician were reported negative. Thick smears were found very valuable in the detection of a few cases in which there was a relatively low parasite density.

The manifestations of malaria in these cases were varied. Some had an acute febrile onset with temperatures usually around 104 F. It is noteworthy, however, that shaking chills were sometimes absent even when the temperature reached as high as 105 F. Even in the same individual in a given series of attacks, a shaking chill might occur in one seizure and not in the following one. Headache and nausea were complained of in many cases and in some instances nausea was the first symptom of the attack. Vomiting was less frequent than nausea alone. Abdominal pain occurred with the attack in 2 cases.

The fever was not always typically tertian in periodicity. In at least two instances it occurred in daily bouts. Occasionally, a few isolated bouts of fever with or without chill, occurring at intervals of several days, preceded the onset of tertian paroxysms.

In 4 cases there were symptoms of an indefinite character during the weeks or months preceding the actual attack. These included headache, abdominal pain, nausea, and weight loss. In two instances the patient complained of recurrent attacks of grippe. It is worthy of note that the symptoms of malaria are indistinguishable from those of grippe or influenza. The similarity is made more complete in some cases of malaria by the presence of herpes labialis.

Enlargement of the spleen was found usually but not invariably Of 21 cases in which physical examination was performed by us, the spleen was felt in 19 Most often it was not markedly enlarged. The 2 cases with pronounced splenomegaly had been ill for three and four weeks, respectively

Of the 38 cases of malaria, only 18 had a history of previous attacks. The other 20 were in men from the Pacific area who had been on suppressive atabrine, and had their first attack after the drug was discontinued. The onset of this attack almost always occurred one to two months following the cessation of atabrine suppression.

In 2 of the 38 cases we observed the blue discoloration of the nail beds and hard palate to which physicians in the armed forces have already drawn attention This pigmentation is attributed to the prolonged ingestion of atabrine

Filariasis

The diagnosis of filariasis was made on the basis of history of residence in an endemic area, symptoms and signs characteristic of the disease, and a positive skin test. With rare exceptions, microfilariae have not been found in members of the armed forces suffering from filariasis. The skin test was positive in the 21 cases in which it was performed. The one case in which the skin test was not done had a classic clinical picture and had been diagnosed by the Army. The symptoms and signs were noted as follows.

Presence of enlarged lymph nodes	14 cases
History of swelling of lymph nodes	3 cases
History of lymphangitis	5 cases
Pain in legs and/or groin	7 cases
Pain in genitals	4 cases
Thickened spermatic cords	6 cases
Fever	8 cases

Six had been diagnosed while in service Not all were infected in the Pacific One had been only in Panama, one in British Guiana, one in Dutch Guiana, and one in North Africa The last was from Puerto Rico and may have been infected there In 14 cases in which the incubation period could be estimated, it ranged from four to sixteen months

Intestinal Parasites

Stools were examined in 144 of the 272 veterans In some instances this was done because of symptoms or a history suggesting intestinal parasites, and in others merely as routine. The examination was done for cause in 81 cases, and as a routine measure in 63 cases. In Table 2 the numbers of each type of parasite found are summarized. It is to be emphasized that if a greater number of stool examinations had been carried out, there would have been more positive findings. In some instances only a single specimen was obtained, in others as many as 10. The average number of stools examined was slightly less than 3 per case (521 in all)

TABLE 2 —Parabites Found in Examination of Stools of 144 Veterans

Protoxoa Endameba histolytica Endameba coli Endollmax nana Iodameba butsohlii Giardia lamblia	13 13 7 2 8
Helminths Hookworm Ascaris lumbricoides Trichuris trichiura Strongyloides stercoralis	8 4 4 1
Double infections Triple infections	12

Intestinal Helminths—Intestinal helminths were found in 12 of those examined as might be expected, there were often more than one The infections found were as follows

Hookworm	8
Ascans lumbricoides	4
Trichuris trichiura	4
Strongyloides atercoralia	1

Of these 12 cases, 3 had filarnasis, 1 had sprue, and 1 had amebiasis in addition to the intestinal parasites

Amebiasis -- Amebiasis, infection with En dameba histolytica, is the most important in testinal parasitic infection with which we have to deal among veterans. There were 14 cases in this series, of which one was an instance of liver abscess in a veteran who had a history of amebic dysentery treated with emetine and carbar sone while in North Africa. The other 13 cases were infectious of the colon. In 5 of these 13 cases there was a definite indication for stool examination. In the remaining 8 the presenting symptom would not lead one to think of amebiasis It is instructive to consider the presenting symptoms in these 13 cases history of duarrhea or amebic dysentery, 3, presence of diarrhea 2; fever, 2 history of malaria, 2, suspicion of filariasis, 1 impotence, 1, skin eruption 1, rou tine examination for tropical diseases, 1

Of the 13 cases of intestinal amebians. 8 had no diarrhea. Of the remaining 5 who had diarrhea, no complaint was made of that symptom in two instances. It was brought out only after questioning and in one instance the history was not elucited until the presence of E histolytics had been determined. In two of the five instances of diarrhea, there was blood in the stool. In one instance the diagnosis was not established until the second series of stool examinations had been done. If repeated examinations had been made in other cases undoubtedly more would have been found with E. histolytica.

The amebic infection was acquired in the Pacific area in seven instances in Africa or Southern Europe in five instances, and in the Southern United States in one instance. The fourteenth case occurred in a veteran who had served not only in the China Burma India theatre but also in the West Indies and in Europe.

It should be evident that there is nothing typical about the symptoms in these cases. If we wait for the classic symptoms to be presented most cases will be missed. Amehiasis should be suspected in every individual who has been in the tropics as well as in any individual who complains of abdominal symptoms of any type for which there is no obyious explanation.

The great potential value of routine examinations of the stool is illustrated by the following case in which failure to make such examinations led to disastrous results

A veteran, 28 years of age who had served in North Africa and Italy from November, 1948, to September 1945 was discharged on October 25, 1945 A few days later he began to have pain in the right lower chest. This pain was intermittent and was attributed to pleurisy by the physician he consulted For three weeks he was kept in bed and treated for this condition. Since he falled to im prove, he was admitted to a hospital on November 23 1945 On admission he had no fever but looked ill and had a white blood count of 12,800 with 88 per cent polymorphonuclear neutrophils. On November 28 it was noted that he had diarrhea. On November 29 a stool was examined and found to contain many cysts and trophozoites of E histolytica. In the meantime because of the finding of an abdominal mass, he had been taken to the operating room where a liver abscess was found and drained On the day following operation he was given his first dose of emetine However, his tem perature rose to 104 8, and he expired the same day If the stools of this veteran had been examined shortly after his discharge, undoubtedly they would have been found positive Even if liver involvement had been present at that time appropriate non surgical treatment probably would have cured him.

Skin Lesions

The diagnosis of dermatomycosis was in most instances a clinical one. In a few cases the presence of a fungus was demonstrated in serajenges from the lesions. The Tropical Disease Diagnostic Service does not have complete facilities for diagnosis and treatment of skin affections, and these cases are usually referred elsewhere for special dermatologic handling

The fungus infections appeared in various locations. Some were found in the groin others in the familiar form of tinea corporis, others on the hands and feet, sometimes involving the nails.

Sprue

Sprue is a much neglected and poorly under stood tropical disease. In its well-marked, relatively advanced stages when there are soreness of the tongue macrocytic anemia, x-ray signs of deficiency disease, and a grossly fatty diarrhea, it is easy to recognize. Lattle attention, however, has been paid to the diagnosis of the condition in its early and mild forms.

Since there is no specific cause the diagnosis necessarily must be on clinical grounds. In our cases the diagnosis was made on the basis of a chronic duarrhea, usually with flatulence, plus the finding of microscopic evidence of a steator rhea, especially the presence of fatty acid crystals,

and the absence of pathogenic protozoa, ova, and bacteria in the stool. There were 10 cases in the veterans seen during 1945 which showed these characteristics and which were considered to be cases of sprue. Only two of them were treated by the Tropical Disease Diagnostic Service. They improved on a high protein diet, together with vitamins of the B group in various forms.

The men who suffered from sprue had served in different parts of the world Four were from the Pacific area, four had been in Africa and Italy, two had been in the West Indies, and one in the China-Burma-India theatre In one instance, the man had served in two different theatres

Discussion

As has been anticipated, certain types of tropical disease are occurring in veterans recently discharged from the armed forces. The diagnosis and treatment of these diseases often calls for special knowledge and experience. Laboratory examinations are almost always essential and usually may be entrusted only to technicians with special training.

Two of the most important of the tropical diseases are amebiasis and malaria. The best practice in connection with malaria calls for the use of thick smears for diagnosis. Technicians examining these smears must have had experience with the altered morphology of the parasite in such preparations. In the case of amebiasis, the examination of freshly passed liquid or semiliquid specimens is essential. Our experience indicates that almost 50 per cent of the cases would be missed if we relied on the examination of casual specimens. The detection of E histolytica in the

stool requires more special experience on the part of the laboratory worker than any other procedure in the field of parasitology

To provide the practitioner with the necessary special laboratory and clinical assistance in the handling of tropical affections, the New York City Health Department has established the Tropical Disease Diagnostic Service This service has been of special value to veterans who have served overseas and civilians who have been in the tropics Special facilities for the handling of tropical diseases are useful in any large port where there is a constant flow of travel In addition to its value to the practitioner, it is of public health importance Prompt diagnosis and treatment of such diseases as amebiasis is one factor in limiting their spread

Under the conditions existing in New York State only a few tropical diseases can be transmitted Foodhandlers affected with amebiasis may infect other persons if they are careless in their personal hygiene. In suburban and rural areas, there are anopheline mosquitoes during the summer months and sporadic transmission or even small outbreaks of malaria are possible, if gametocyte carriers are present. Malaria may also be transmitted by transfusions of blood from donors with latent infections

Summary

Tropical diseases were encountered in 119 of 272 veterans examined specifically for them during 1945. The commonest diseases were malaria, filariasis, fungus infections of the skin, amebiasis, intestinal worms, and sprue. Special laboratory and clinical facilities are important for the proper diagnosis and treatment of these so-called tropical diseases.

PHYSICIAN AND DENTIST LEGISLATORS

In the 80th Congress there are eight physicians and two dentists, one more physician and one less dentist than in the 79th Congress—Stimulated by this knowledge, the A M A was curious to know how many physicians and dentists might be found in the legislative halls of the states, and addressed an inquiry to representative physicians in each state

As a result of this inquiry, it was learned that in thirty state legislatures there are fifty-three physicians and sixteen dentists, while eighteen states report no physicians or dentists in their legislatures Eighteen states have but one physician, while nine have two physicians serving this year, and three have four, five and six, respectively. The governor of one state is a physician. Twelve states have one or two dentist legislators.

An inquiry as to the number of osteopaths or chiropractors disclosed that but two states each have one chiropractor in the Senate One legislator holds a degree of D D S as well as that of M D

DIGITALIS AND EMBOLIC MANIFESTATIONS ASSOCIATED WITH RHEUMATIC AND ARTERIOSCLEROTIC HEART DISEASE

SAMUEL EPSTEIN M D, Brooklyn, New York

(From the medical services of the Coney Island Hospital)

R ECENT noteworthy publications in the treatment of aurucular fibrillation in arterioselerotic heart disease with cardiac infarction in the use of dicumarol in acute coronary throm bosis 2 and in the use of digitalis in congestive failure associated with cardiac infarction? have posed an interesting and important problem in the management of these conditions. The problem has become further complicated by recent work pointing out the thrombogenic effects of digitalis and digitalloids 4. Macht's recent contribution on the thromboplastic effects of mercurials is likewise noteworthy, as are the thrombogenic properties of theobromine and theophylline

In contradistinction to these facts is the material dealing with potentially hypoprothrombinemic drugs. The demonstration that 5 grains of
quinine sulfate taken orally daily for six to six
teen days may give a significant rise of prothrombla time seems to be of some potential clinical
value. Should thus be shown to be true of
quinidine sulfate and work is under way to
demonstrate this, we may find a ready explanation
for some of the contradictory results published 1-3
The role of sallcy lates and sulfonamides in
hypoprothrombinemm is also of significance

Askey and Neurath' have shown that the ad ministration of digitalis in auricular fibrillation associated with congestive failure (the usually unquestioned indication for digitalis) in myocardial infarction appeared definitely to increase the production of fatal emboli to the greater circulation On the other hand quinidine exhibition was not associated with an increased percentage of fatal emboli It would seem that in addition to the prolongation of auricular fibrillation by digitalis as contrasted with quinidine, with the increased opportunity for auricular thrombus formation, that the thrombogenic properties of digitalis also play a role. The shortened prothrombin time following cardiac infarction, together with the disturbed clotting mechanism occurring with bed rest which tends further to increase clotting tendencies also may be signifi-The question of prime importance here is the fact that quinidine administration was associated with a lowered incidence of embolic Peters et al.2 have been able to phenomena lower the incidence of embolism postcardiac infarction from 16 per cent of 60 control cases to 2 per cent (1 case) of 50 dicumarchised cases. This points the way for what must be attempted in handling the conditions under discussion, in order to lessen the astounding incidence of embolic episodes in medical cases ande from surgical cases

In a similar vein we may consider the frequent incidence of embolic manifestations in rheumatic heart disease, especially following the onset of auricular fibrillation and the attendent necessity for digitalis control of the ventricular rate Here, too, in addition to the previous classic conception of the mechanism of thrombus forma tion and embolism, we must again add the throm bogenic properties of digitalis Similarly, the mercurial diurctics, and vanthines may well be indicted along these lines. Therefore, we must conclude that the incidence of embolic manifesta tions under these circumstances might be lowered considerably, if we could counteract by anticoagulants now available and those soon to be available the thrombogenic effects of the nathologic physiology of the state itself of the enforced bed rest, and of our medication (digitalis, mercurials xanthines)

Summary

- 1 There is pointed out the recent contributions concerning the thrombogenic properties of digitalis, the xanthines and the mercurial diureties.
- 2 The contrasting hypoprothrombinemic effects of quinine (and possibly quinidine), salicyl ates, and the sulfonamides have been indicated
- 3 The significance of these facts in the embolic manifestations associated with rheumatic and artenosclerotic heart disease and in the attempt to lower the incidence of these manifestations has been discussed.

A SEVEN AND ONE-HALF YEAR REVIEW OF PNEUMONIA THERAPY

FREDERICK O KRAUS, M D, Ridgewood, New York

(From the Medical Division of The Wychoff Heights Hospital, Brooklyn, New York)

CHEMOTHERAPEUTIC agents were introduced to the medical practice as specific drugs in pneumonia therapy in 1938. The first case so treated at Wyckoff Heights Hospital, Brooklyn, was in May of that year, and it is with this case that the present study begins

During succeeding years, new and purportedly more definitely specific therapeutic agents against the pneumonias, both lobar and bronchopneumonia, were introduced, and the statistical value of each entity is analyzed in this study. Accordingly, a progressive annual decrease in mortality as well as morbidity, and, concomtantly, a decrease in the number of complications should be revealed. The following data present the yearly changes in the results from May, 1938, to December, 1945, with cases of pneumonia at Wyckoff Heights Hospital.

Annual Mortality

The number of cases of pneumonia per year, the sex distribution, along with percentage mortality is shown in Table 1 The columns are totaled to give succinctness to the data

Table 1 shows an increase in the number of cases during the years, with a peak of 106 cases in 1945. Lobar pneumonia is shown to be more common than bronchopneumonia in the ratio of 1 to 24. The sex distribution is nearly equal. The data show a very sharp decline in mortality in 1945, but the average mortality, in spite of the specific therapy, is approximately 1 of every 5 patients. This obviously high mortality is due to the nature of the diseases with which the pneumonia was associated.

Mortality by Age and Sex—The age incidence and mortality in the two sexes is presented in Table 2 (see top of page 1133) They show the number of cases as well as the mortality per decade of life per year The columns have been totaled to facilitate a quick grasp of the trend of events

The data of Table 2 present the mortality in 281 men, with a death rate of 22 0 per cent (62 cases), and in 258 women, with a death rate of 19 7 per cent (51 cases) The incidence of pneumonia in infancy and early childhood is demonstrated. The mortality, however, is greatest in persons past middle life.

TABLE 3 -- PNEUMONIA--PERCENTAGE MORTALITY

Year	Men	Women	Total
1938	28 0	25 0	26 5
1939	10 5	22 2	16 2
1940	23 5	23 5	23 5
1941	19 1	35 3	25 6
1942	23 4	9 9	18 P
1943	34 3	13 5	23 9
1944	38 2	20 0	25 8
1945	88	16 0	12 2
Average	22 0	19 7	21 0

Annual Mortality Rate -The percentage mortality in both sexes, and the average for the seven and one-half years, is shown in Table 3 vearly fluctuations and the low mortality for 1945 are noteworthy These figures contrast with reports by Buchanan and Ashley, who, while working at Coney Island Hospital, found a mortality of 34 per cent with nonspecific therany in cases treated for several years prior to They also reported² a mortality in 1934 of 14 per cent in all cases treated with antipneumococcal serum, the only truly specific therapeutic agent available at that time mortality reported in this present study of 537 cases, when completely analyzed, will show the value of the recent specific therapy

Mortality by Type of Pneumonia

The mortality per annum due to lobar pneumonia and bronchopneumonia is given in Table 4. This table shows considerable variations, but no definite conclusions can be drawn from data available.

the exact causative agent is as important today as formerly as the present therapy is effective against these causal factors. The atypical cases would be recognized promptly if bacteriologic studies were made early in the treatment of CASCA.

Confirming the Diagnosis

The clinical diagnosis of pneumonia should be confirmed by roentgenograms of the chest. This is just as important today as in an earlier period Table 7 reveals the need for more active interest. in confirming the diagnosis in each patient.

Total	8	-5	4	14	10	7	13	-5	66

Such an analysis reveals that specific therapy has resulted in but a very slight decrease in the total number of hospital days per patient Prior to 1934, the average number of days hospitalization for pneumonia cases was 21

Complications—The medical complications which were associated with the pneumonias are analyzed in Table 9—This table shows pleurisy, pleurisy with effusion, and empyema to be the most frequent complications—The conclusion must be drawn that specific therapy has not significantly reduced the number of complications per year

Associated Diseases

Table 1 of this study shows the percentage mortality per year and the average mortality for the seven and one-half years (210 per cent) This figure, without an analysis of associated diseases which in themselves are a cause of mortality, might give the impression that the present therapy for pneumonia per se is not of great In order to demonstrate the reason for the high average mortality, the following data are presented The patients who died without treatment for a minimum of three days are not considered as having had sufficient therapy to indicate the value of such therapy The percentage death from these causes is deducted from the average mortality for the study period, and the actual mortality for pneumonia per se is thereby obtained These data are incorporated into Table 10

Of the 113 deaths, actually 95 can be attributed to other causes Excluding these 95 cases from our study, the total number of cases reviewed is 442 With 18 deaths due to pneumonia per se, the mortality is 4 07 per cent

Modern Trend of Therapy

Specific therapy has changed with the introductions of newer chemotherapeutic and antibiotic agents Table 11 (see page 1135) shows the year of introduction of these agents, the total number of cases in which the agent was used, either alone or in combination, as well as the mortality

Table 11 reveals that the specific therapy of pneumonia is now centered on the use of sulfathiazole, sulfadiazine, and penicillin Sulfathiazole has been used alone or in combination in a total of 260 cases of all types, with a mortality of 154 per cent

Sulfadiazine was used alone or in combination in a total of 92 cases of all types, with a mortality of 130 per cent. Penicillin has been used alone or in combination in a total of 90 cases of all types, with a mortality of 188 per cent. The only year in which a marked reduction occurred in the mortality in this study was 1945. This undoubtedly is attributable to the more frequent use of penicillin in large doses.

Summary

Detailed analysis of data presented demonstrates a mortality of 4 07 per cent for pneu-

TABLE 10 -Analysis of Mortality

Y ear	Total Mortality	Mortality with Surgical Condition	Mortality with Medical Condition	Mortality with Insufficient Therapy	Mortality with Sufficient Therapy

monia per se This figure indicates that the present mortality undoubtedly is due to organisms which hitherto have been unidentified and necessitates the careful determination where possible of the causal organism in each case of pneumonia before treatment is begun

This is one means which will lead to the correct therapy for the small group of atypical

WHAT DOES THE MEDICAL SOCIETY OF THE STATE OF NEW YORK DO FOR ITS MEMBERS?

The Council Committee on Public Health and Education

The Council Committee on Public Health and Education is engaged in a considerable number of activities which require planning, organizing and directing. These activities are not confined to the Medical Society. A very close operating relationship with several government agencies the nine medical schools in the State and several other professional and research groups is necessary.

While a Committee of three has the responsibility of management, it is a large group of physicians subcommittee members and advisers who make the machinery work. In this brief statement, it is quite impossible to relate satisfactorily or in detail the numerous and important functions of the Committee.

impossible to relate satisfactorily or in detail the numerous and important functions of the Committee.

Postgraduate education is the best known of these functions. All of the members of the Society know something about it Few of them know about the work involved in the preparation of the Course Outline Book arrangements for financing the program, and the endless number of such things as complying with requests for speakers for county medical societies academies of medicine, and hospitals taffs. It should always be emphasized that postgraduate education is a cooperative endeavor of the Medical Society of the State of New York and many educational institutions, and that it is financed by the Medical Society and the New York State Department of Health Education is a common ground for cooperation and we are fortunate to have such a satisfactory arrangement

At the present time, the Council Committee on Public Health and Education has the following organization Council Committee—three members advisers—Commissioner of Health of the State of New York and Deputy Commissioner of Health of the State of New York Subcommittee on Maternal Welfare, Subcommittee on Child Welfare, twelve Regional Chairmen on Obstetrics twelve Regional Chairmen on Pediatrics Subcommittee on 4-H Clubs and Youth Health Activities Joint Committee on Dental Health—Modical Society of the State of New York and Dental Society of the State of New York Study Committee on Industrial Health, Subcommittee on Hard of Hearing and the Deaf Subcommittee on Cancer, Subcommittee on Rehabilitation Subcommittee on Mental Hygiene and advisers regarding classification of specialists.

CLINICOPATHOLOGIC CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL, New York City

Date October 14, 1946

Conducted by MAXWELL L GELFAND, M D, and WILLIAM A LEFF, M D

PRIMARY CARCÍNOMA OF THE LIVER

DR WILLIAM A LEFF (Resident) The patient, P M, a 59-year-old colored man, was admitted to the Fourth Medical Division of Bellevue Hospital on February 15, 1946, with complaints of vomiting and swelling of the abdomen for twentyone days Until three weeks prior to admission he had been entirely well, but had noticed that his "eyeballs were slightly yellow" for the last few months During the three weeks prior to admission he had vomited once or twice daily small amounts of greenish fluid with recently He also had marked anorexia and eaten food He used laxatives daily but the constinution stools were small in amount and brown noticed gradual swelling of his abdomen along with increasing abdominal pain, weakness, and malaise Because of his occupation as a floor and woodwork cleaner, he came in contact with There was no history of various chemicals operations, allergies, or injuries He had had gonorrhea many years before with occasional dysuria since that time

On admission the temperature was 97 F, the pulse, 88, respirations, 16, and blood pressure, 100/60 The patient was a well-developed and well-nourished colored man of 59, lethargic and very weak, but in no real distress, lying still but crying out with pain upon any movement pupils reacted to light and accommodation conjunctivae were mildly icteric Fundoscopic examination was negative The trachea was deviated to the right slightly Examination of the chest revealed shallow breathing, dullness over lower one half of both lung fields, distant breath sounds over upper one half of lung fields and absent breath sounds in the lower quarter of both lung fields The heart was not enlarged to percussion, the sounds were of fair quality with regular sinus rhythm No murmurs were heard The abdomen was markedly distended and there was a definite fluid wave No organs could be palpated There was marked tenderness over the entire abdomen, especially in the umbilical and epigastric regions Rectal examination revealed two plus enlargement of the prostate which was firm but not hard There were no masses, blood, or stool on the examining finger The reflexes were physiologic

Course and Laboratory Data—Urmalysis showed two plus albumin, specific gravity of 1 024

and occasional hyaline casts, no bile but urobilinogen was present in concentration of 1 10 The white blood count was 17,200 with 77 per cent polymorphonuclears (of which 9 per cent were immature forms), 21 per cent lymphocytes, and 2 per cent monocytes The hemoglobin was 9 Gm, red blood count, 3,030,000 On the evening of admission he was seen by the surgeons and accepted for transfer with the opinion that he might have had a large bowel obstruction, probably carcinoma of the rectosigmoid It was the opinion of several other observers that the patient had cirrhosis of the liver and carcinoma with metastases to the liver A flat plate of the abdomen was reported negative, and a note by the surgeon stated "doubt there is a true obstruction here" Three days later, it was decided to do an abdominal paracentesis which yielded "bloody fluid" and blood oozed from the wound Several hours later he became incontinent, irrational, and slowly lapsed into a comatose state A neurologist was called who said "that it is possible he had a right middle cerebral thrombosis but in his state of unconsciousness neurologic localization is hardly possible" The blood nonprotein nitrogen was 95 mg per cent He was given intravenous glucose and saline, but lapsed into a deep coma and expired quietly on the seventh hospital day

Discussion

DR MAXWELL L GELFAND From the facts just presented, it appears that this 59-year-old colored man, a woodwork cleaner, had a short history of three weeks' duration of vomiting, anorexia, weakness, and increasing abdominal swelling with pain The most outstanding physical findings were (1) ascites of a bloody nature, (2) marked tenderness over the entire abdomen, (3) signs of diminished breath sounds in both bases, and (4) terminally, a comatose state The chest signs suggesting pleural fluid were not corroborated by fluoroscopy

The most common cause of ascites is cardiac disease, as shown by Cabot in 1912, in a study of 5,000 autopsy cases. However, inasmuch as there is no antecedent history of hypertension, lues, rheumatic fever, coronary artery disease, or physical findings referable to the heart, we may dismiss this. Diffuse glomerulonephritis may also cause edema with ascites. In this the eyelids,

face, back and thighs are involved in addition to the serous cavities. Elevation of blood pressure and oliguran precede the edema. Azotemia, anemia, and urinary findings help in the diagnosis. This patient, although there was no hypertension, presented an anemia and azotemia terminally. However, because of the high specific gravity and negative microscopic findings, intrinsic pathology as the cause of the latter can be excluded. The high specific gravity and azotemia can be explained by the prerenal azotemia mechanism as a result of the azotes.

Curhosis of the liver with portal decompensation is the next most important condition that can produce ascites. The latter may be the initial symptom without previous warning, as was shown by Snell in 18 per cent of 112 patients Gastrointestural symptoms as indigestion, flatu lence, nausca vomiting, and weakness are common symptoms of this disease Jaundice of slight degree occurs in between 50 to 65 per cent of these cases and enlargement of the liver is usually found Cerebral symptoms from confusion loss of concentration to come frequently occur as a terminal stage of this disease The history and physical findings of this patient can easily fit into this picture even though he did not demonstrate evi dence of collateral circulation spider nevi hemor rhagic tendencies and laboratory evidence of liver damage. However, the rapid course and hemorrhagic fluid cannot be explained merely on the basis of currhosis and brings to mind a more malignant process

It is well known that primary hepatoma of the liver is frequently associated with previous liver damage, particularly cirrhosis. This condition must be considered in men over fifty years of age who have a hemorrhagic ascites and an acute abdominal catastrophe, and succumb within a The bloody or serosanguineous nashort time ture of the abdominal fluid occurs because of thromboses of the portal vein Enlargement of the liver occurs in only about one half of the cases and frequently cannot be palpated until the abdominal distension is relieved by paracentesis Anemia and leukocytosis with variable iaundice and rarely disturbed liver function tests are characteristic

Malignant disease of the gastrointestinal tract can produce ascites of a bloody nature. The mechanism of ascites, we all know, is one of four, namely (1) peritoneal metastases (2) pressure on the portal vein, (3) involvement of the retroperitoneal glands and lymphatics, and rarely (4) by direct invasion of other the inferior vena cava or portal vein. In this condition one may find x ray evidence of a lesion and examination of the ascitic fluid usually reveals blood with a high protein content and tumor cells. Unfortunately, our data is lacking considerable important find

In Chiarris syndrome occlusion of the hepatic veins in addition to the arcites, rapid enlargement of the liver with abdominal pain and tender ness, high venous pressure, cyanosis and distension of the neck veins are important signs which our patient did not present.

A condition that is frequently overlooked, although rare, is hemoperitoneum. In this there is usually a history of trauma, although rupture of a mesenteric vessel or dissecting abdominal aneurysm may be the cause. Shook and other signs of hemorrhage depending on the extent of rupture and speed of bleeding, are usually present

In conclusion I would say, therefore that from the history physical findings, and the possibilities enunciated that the most likely diagnosis of this patient is

- 1 Primary carcinoma of the liver with under lying currhous
 - 2 Thrombosis of the portal vein

3 If the above is not found I should like to suggest the possibility of hemopentoneum as a result of an intra-abdominal vascular accident. However, on this basis I could not account for the jaundice noted before admission.

DR HARRY A SOLOMON From the data presented such as nonobstructive icterus, anorexia, weakness, and massive ascites it would seem that the underlying condition in this case was one of diffuse liver disease with sovere hepa tocellular damage and portal decompensation Because of madequate evidence the nature of the liver disease could not be determined the differential diagnosis of ascites no mention is made as to whether or not a venous hum was heard. As a diagnostic sign a venous hum heard over various parts of the body is of doubtful significance, but when heard over the abdomen in the areas below the xiphoid process of the sternum or above the umbilious, it is practically pathognomonic of portal obstruction

Careful auscultation is required to hear this low-pitched, continuous murmur which is due to the development of a collateral circulation in portal hypertension, as in cirrhosis of the liver It is an essential diagnostic feature, and the venous murmur may be quite loud and accompanied by a palpable thrill, in the Cruveillner Baumgarten syndrome Here the portal hypertension is due to congenital hypoplasia of the liver, and the excessive collateral circulation is associated with patency of the umbilical vain

In this case because of the rapid development of massive assites it is likely that the portal hypertension if present is due to thrombosis of the portal vein or its intrahepatic radicles, and that the bloody assitic fluid is due to rupture of small collateral veins Pleural effusion which may develop in cirrhosis of the liver and, like the venous hum, is due to the development of a collateral circulation may also be hemorrhagic in character

In the last two cases of Wilson's disease on our wards, a venous hum was heard in both, and in currhosis of the liver the hum can be heard, in my experience, in over 10 per cent of the cases

DR EMANUEL APPLIBAUM It seems to me that the most plausible diagnosis in this case is primary carcinoma of the liver The symptomatology and the relatively short clinical course are entirely consistent with this diagnosis While decompensated portal cirihosis of the liver may and often does present a similar clinical picture, it almost never causes a bloody ascitic fluid Of course, it is possible to have a primary carcinoma of the liver superimposed on cirrhosis

In this connection it is well to recall that from a pathologic point of view three types of primary hepatic carcinoma are recognized. First, there is the solitary nodule type, with one large tumor mass occupying a large portion of one of the liver lobes. Second, we have the multinodular form, in which the liver is studded with many tumor nodules of varying size. In the third type the primary carcinoma is superimposed on a pre-existing cirrhosis, from which it is often indistinguishable in the gross. The last type occurs in about one third of the cases.

It may also be of interest to mention that metastasis from primary carcinoma of the liver is frequently by direct extension along the veins in the form of neoplastic thrombophlebitis. In this manner the tumor may creep into the vena cava and invade also the heart and lungs. This is similar to metastasis from hypernephroma

DR MENNASCH KALKSTEIN There is ample evidence in this case to suspect the presence of hemoperitoneum. The grossly bloody abdominal fluid, the peritoneal irritation manifested by exquisite tenderness, and the presence of jaundice without bile in the urine support this

Trauma cannot be ruled out among the other possible causes of hemoperatoneum. The absence of such a history should not eliminate this possibility.

Discussion of Pathology

DR HENRY SPITZ The body showed marked cachevia. No leg edema was noted. A small recent paracentesis wound was found on the anterior abdominal wall just below the umbilicus. It was sutured with catgut and the tract through the left rectus abdominis mulcle was surrounded by hemorrhage. The sclerae were interior. The peritoneal cavity contained a yout 2,000 cc. of bloody fluid. The liver was small, nodular, and

weighed 1,100 Gm, the left lobe of the liver was covered by clotted blood When that was wined off, no tear or rent was found in the liver parenchyma Elevated above the nodular surface was one hemispherical mass, measuring 5 cm in diameter It was soft, white, and surrounded by smaller similar nodules The remainder of the liver was fawn-colored with areas of green section, complete distortion of the architecture The liver parenchyma was replaced by yellow and green nodules varying in size from 1 to 5 mm separated by grayish-red bands of In the left lobe the aforefirm fibrous tissue mentioned mass was found replacing the greater portion of the lobe Its center was reddishbrown and necrotic, its periphery firmer and white Scattered around this mass were several sımılar nodules varyıng in greatest diameter from 05 to 15 cm A few metastatic nodules were present in the right lobe of the liver

The portal vein was almost occluded by a The spleen was slightly enlarged, weighed 200 Gm, and showed no other gross abnormalities The esophageal veins in the lower one third were dilated but no point of rupture was seen The other organs, save for mild congestion, showed no important changes Histologic examination of the liver revealed the typical picture of portal cirrhosis with rather marked regeneration of liver cells These formed large nodules with extensive fatty infiltration and many areas of fresh necrosis The tumor nodules were composed of atypical liver cells The centers of the nodules were widely necrotic In many areas there was invasion of intrahepatic branches of the portal vein by tumor cells distant metastases were found in any of the organs examined The renal tubules showed mild degenerative changes No other important lesions were found

There is a striking discrepancy between the short clinical course of the disease and the advanced changes that were found in the liver However, portal curhosis may remain asymptomatic for a long period of time and often gastrointestinal hemorrhage or persistent ascites first induces the patient to seek medical aid case, the rapid course is well explained by the extensive fatty and necrotic change that supervened in the cirrhotic liver combined with the local and general effects of the carcinoma thrombosis of the portal vein was an important factor in the development of the rapidly mcreasing ascites No point of bleeding was found that might explain adequately the presence of frank blood in the peritoneal cavity Usually, extensive necrosis, hemorrhage, and rupture of the tumor are the causes of intraperitoneal hemorrhage in these cases These were not found

The hemorrhage into the rectus alxlominis muscle was slight and no clot was found attached to the paracentesis aite. It is conceivable that a vessel had been punctured during paracentesis causing considerable hemorrhage and had then retracted so that it could not be identified at autopsy as the source of bleeding. This, however, is only conjecture No definite explanation can be given on the basis of our findings.

A careful investigation of his hematologic status might have helped in determining the type of anemia that was present on It is not inconceivable that hemorrhagic ascites had been present

already on admission and was in part the cause of the anemia.

Anatomic Diagnosis

The anatomic diagnosis was as follows portal cirrhosis of liver, carcinoma of liver, hepatocellular type, with direct extension into branches of the portal vein thrombosis of portal vein with organization and recanalization splenomeraly mild, due to portal hypertension, ascites, dila tation of esophageal veins, jaundice, cachexia, paracentesis wound with hemorrhage into the left rectus abdominis muscle, and hemorrhage into peritoneal cavity

NEW METHOD TO REDUCE DEATH RATE FROM ACUTE APPENDICITIS

Use of penicillin and sulfadiasine has reduced the death rate the length of illness, and complications from acute appendicitis, according to four Chicago doctors writing in the March 29 issue of the Journal of the American Medical Association

The physicians are Drs. William D Griffin, Joseph Silverstein, Harry G Hardt, Jr, and Landon Seed from the Hektoen Institute for Medical Research of the Cook County Hospital Chicago They point to a mortality of approximately I per cent for the 108 patients with acute appendicities treated with the two drugs between March and October 1946 In the period 1944 to 1945 before these drugs were used in conjunction with the stand ard treatment, the mortality rate was 4.8 for 592

appendectomy patients

The average hospital stay also has been reduced as a result of the use of the drugs

In 1935 a patient had to remain in the hospital anywhere from 12 1 to 10 6 days, depending on the complication in 1944 he had to stay from 11 0 to 19 7 days, whereas in 1940 he stayed between 7 9 and 11 7 days

The drugs were administered in the following way Twenty thousand units of penicillin were injected into the muscles before operation followed by 20,000 units of penicillin every three hours for four days after surgery, totaling 660 000 units. The petients

also received 1 Gm. of sulfadiazine four times a day after the operation. Both drugs were used in order to obtain a greater range of protection against the

possible growth of bacteria.
The 108 cases were classified as follows (1) acute appondicitis producing pus, 62, (2) acute gangre-nous appondicitis 17 and (3) perforated appondicitis 29 There were 77 adults, of whom 55 were men and 22 were women, and 31 children.

Three cases of abdominal abscesses and 1 case of pelvic abscess were observed in this series. The authors state that these abscesses subsided spontaneously on the continuation of the routine ad ministration of penicillin and sulfadiasine. The masses became less tender smaller and then disappeared ' The temperature gradually dropped to normal, they report, and the patients were dis-charged by the twenty first day following operation.

"There were 9 instances of wound infection, according to the Chicago physicians In 5 of drains were inserted at the time of operation In 5 of these use of penicillin and sulfadiasine seemed to prevent development of severe infection in the wounds In the infected wounds there was also an apparent absonce of local tissue reaction as evidenced by a minimal amount of pain tenderness, heat, and swelling of the surrounding tissues'

NONSPECIFIC GRANULOMÁTOUS LESIONS OF THE INTRA-ABDOMINAL LYMPH NODES

ABRAHAM O WILENSKY, M D, New York City

THE presence of associated lymphadenitis in the appropriate lymph glands to neighboring foci of nonspecific granulomatous inflammation in the alimentary tract (ileitis, etc.) is, in its simplest forms, accepted without especial thought as a natural sequence of events. It is not, however, generally appreciated that the lesions in the lymph nodes may outweigh in their importance the immediate effects of the intestinal lesion, and that after apparently successful operations in which the affected loop is removed, the lesion may recrudesce in an aggravated form in the lymph nodes. A rather outstanding example of this having occurred in my experience, it is reported herewith

Case Report

In 1937 a 22-year-old man went through an episode of diarrhea lasting six months, following which a mass developed in the right lower abdominal quadrant. He was then operated upon by another surgeon, who realized that the condition was more than an appendicitis, but nevertheless, did no more than remove the appendix and drain the area. The patient then received some radiotherapy with temporary closure of the wound. Later, however, an abscess formed in the scar which necessitated secondary incision and drainage. Thereafter the resultant sinus never healed. The diagnosis of a nonspecific granuloma was certain and the patient was then operated upon by me. The operative record was as follows.

The general peritoneal cavity was negative area of the previous operation was well walled off and contained a fistula which led directly into the cecum The cecal pouch was very much thickened and had the usual appearance of a granuloma A moderate number of enlarged glands were present in the ileocecal corner of the mesentery Two loops of the cecal corner of the mesentery Two loops of the small intestines in the terminal ileum were adherent to the site of the fistula and each of them was occupied by a perforation from the granulomatous After the exploration was completed, a resection was made of the terminal ileum containing the two sites of perforation, the cecum and about three inches of the ascending colon, including also that part of the mesentery which contained the large lymph nodes The stumps of the ileum and the ascending colon were closed and the continuity of the bowel was re-established by a side-to-side anastomosis between the stump of the ileum and the stump of the ascending colon The opening in the mesentery and the peritoneal defect in the lumbar gutter were closed by suture There was an uneventful convalescence, and the patient was discharged from the hospital well

The pathologic examination of the specimen showed the usual picture of a nonspecific granuloma of the cecum

The patient remained well until 1944, at which time he again went through an episode similar to that previously experienced but without the depart of an absecss, or spontaneous or operative of the site of the previous operation. The gain subsided, and the man remained well arly part of 1946

Then the patient again developed pain in the lower right quadrant, with temperature going as high as 104 F. Various local measures were tried, including prolonged periods of treatment with the sulfa group and with penicillin. No therapeutic effect was noted, the symptoms continued, and the man was incapacitated for any work. These conservative measures were continued by the local family physician until everyone's patience was exhausted and surgery was again resorted to

The second operative exploration showed a large mass involving the entire area of anastomosis between the ileum and the colon and the adjacent coils of ileum and ascending colon All of the tissues were tremendously thickened and inflamed and the induration extended outwards into the mesentery and across the median line overlying the spine Numerous enlarged glands were included, and the entire mass was fused together by dense adhesions dissection was most difficult because of the danger of injury to the ureter and the duodenum Nevertheless, it was finally possible to free and deliver the entire mass into the wound and to resect it in toto Sulfanilamide powder was insufflated all over the operative field and the wound was closed with abundant dramage There was an uneventful convalescence and healing and the patient was discharged from the hospital well after three weeks

The pathologic study of the specimen was made by Dr Arthur Schiffin, who reported the following The specimen consisted of a mass of tissue aggregating in volume, the size of a honeydew melon. It included 30 cm of ileum. The mucosa of the latter up to the ileocolonic stoma was smooth and showed no ulcerations or polyps. The wall was very slightly thickened, mainly due to serosal adhesions. The specimen included the stump of the resected colon, which was free of any abnormality, and about 30 cm of the ascending colon. The lumen of the latter was wide, but its entire mucosa was delicate and

free of any ulceration or polyps

At a distance of 1 cm. from the intact stoma, in the colon, there were two flattened ulcerations. The edges were friable and reddened but not indurated. Simple probing of one of them penetrated the gut wall and ended in a blind indurated pericolonic area. The other opening led into a walnut-sized cavity whose edges were indurated and covered by dirty gray, friable material. This cavity was closed on all sides by the mesocolon. Sections through the mesocolon in this area showed it to contain indurated white fat tissue and lymph nodes. No foreign body was found within the cavity.

Sections Through the Fistulous Tracts—There was a broad ulcer at the site of the larger fistulous tract. It was devoid of a mucosal layer and its base contained no mucosal glands. The base of the ulcer consisted of granulation tissue which was in continuation with the granulation tissue undermining the submucosal and muscularis areas of the adjacent gut wall, and with the granulation tissue which lined the tract extending from the luminal side of the gut into the pericolonic tissue. Within this granulation tissue there were numerous foreign body types of giant cells, numerous polyps, numerous round cells, and numerous small and large congested capillaries lying within edematous stroma. Large polygonal

macrophagic cells were also present. There were foci of necrosis and necrobiosis, but no cascation was seen and no typical tubercle formation was found. Fibrosis was present and was limited to the area of

the sinus tract.

Study of the mucosa adjacent to the large fistulous onfice showed it to contain regular mucosal glands lined by mucinous columnar cells The mucosal stroms was rather delicate and showed infiltration by round cells and scant polype. The submucosa outside of the immediate area of the fistulous tract was also relatively intact, showing only moderate hyperemia and moderate infiltration by round cells and polymorphonuclears without remarkable fibrosis. The muscular layer was not especially broadened, but the serosal fat tissue and serosal area was widened and showed infiltration by round cells and polyps and necrobiosis and interstitual hemorrhage. No giant cells were found within this area of the serosa even where the infiltration by round cells was marked. This was in contrast to the granulation tussue on the level of the serosal layer lining the tract and showing marked infiltration by foreign body type of giant cells.

The small fistulous orifice in the colon near the ileocolonic stoms was lined by granulation tissue which was in continuity with the cavity within the submucosa leading into the gut wall through the muscularis to the pericolonic cavity. There were numerous foreign body giant cells throughout all the granulation to sue lining the wall of the tract The edges of this tract orifice contained overhanging glandular mucous membrane showing fibrosis and infiltration by round cells The mucosa and sub mucoea and wall of the gut at only a little distance from the sinus tract was not especially thickened. Fibrosis and round cell infiltration were shight There were small submucosa lymph folicles which showed mild hyperplasia. There was no caseation of tubercle formation.

Sections Through the Heocolonic Stoma -The mucosal area showed ulceration and mild polypoid elevations. Diffuse fibrosis with infiltration by numerous round cells and scant polymorphonuclears and plasma cells was present. Some of the glands were atrophic No foreign body type of giant cells were present here Several submucosal lymph follicles were present but no cascation or tubercle formstion was seen. Round calls infiltration and fibrosis extended into the perimuscularis connective tissue.

There was no especial thickening, fibrosis, or cellu lar infiltration of this portion of the serosal area. Sections Through the Wall of the Pericolonic Abscess Carity -These showed markedly hemorrhagic granulation tissue containing many foreign body grant cells and dense fibrosis. Several small lymph nodes within the wall of the cavity showed hyper plasia, but no cascation tubercle formation or giant cell reaction

Sections Through the Colon at a Lettle Distance from the Futulous Orafics.—These showed intact mucosal glands and moderate fibresis and round cell infiltration of the submucosa. The outer wall at this site showed a broad zone of cellular granulation tusue containing numerous foreign body type of giant cells. This area formed part of the wall of the pericolonic cavity

Sections Through the Ileum.-Through the juxta stomal portion these contained a flattened mucosa and showed slight fibrosis of the mucosa and submucosa with marked plasma and round-cell infiltration of the mucosal stroma, and broadening and flattening of the mucosal folds

Sections Through the Ileum at the Proximal End of the Specimen .- There was a thin mucosa and round cell infiltration of its stroms.

Summary of Pathologic Examination

Partial ileocolectomy included the ileocolonic stoma. Two fistulous onfices within the colon were 2

situated 1 cm. from the stoma.

Fistulous tract led from these sites into a pericolonic abscess whose walls were formed by colon and mesocolonic fat tissue.

4. Sinus tract and pericolonic abscess were lined by granulation tissue containing numerous foreign

body type of giant cells.

5 Chronic ulcerative, nonspecific, fibrosing inflammation of the ileocolonic stoma without foreign body giant-cell reaction was present at this site

Hyperplastic lymph nodes were present within the wall of the absects cavity

No evidence of caseation or tubercle forms tion was found in either the sinus tract or lymph

Discussion

In the present state of knowledge it must be assumed that all forms of intra-abdominal lymphadeni tis are secondary to a primary legion in the territory drained by the given group of nodes.1 Inasmuch as the nodes in the ileocecal angle are related to the terminal ileum the appendix, and the ascending colon one must necessarily look for the primary lesion there It is distinctly suggestive that in this part of the intestinal tract the lymphadenoid follicles are especially abundant and find their best developments in Peyer's patches. The suggested connection in the primary inception of the disease is strongly supported by the well-known course of i.e ulceration of the events in typhoid fever Peyer's patches mesenteric adenitis etc. The chain of events is further corroborated by similar phenomena which occur elsewhere in the body

My experience with intra abdominal mesen teric adenitis has been described on several previous occasions. The experience may be classified as fol-

lows

Acute Intra-abdominal Lymphadenitis —Cases occur in which the clinical picture resembles very markedly that of an acute attack of appendicitis and in which the pathologic anatomic findings con sist of moderately enlarged glands which microscopically show a simple hyperplasia. No gross changes are visible demonstrably in the appendix or in the neighboring coils of small or large intestine, and the entire process subsides in the operatively proved cases spontaneously

B Acute Suppurative Intra-abdominal Lympha denutes -The glands in a small number of cases are larger and go on to suppuration Drainage of the resultant abscess is necessary. I am sure that some of the cases in this group are recorded as cases of appendiceal abscess in which the appendix is

thought to have aloughed out.

O. Chronic Nonspecific* Granulomatous Form of Mesenteric Adenilis - Cases in which an excessive production inflammatory or granulomatous tissue is produced gluing together glands and adjacent loops of intestine. Fever continues indefinitely or

with periods of remission. Accumulations of pus break through into the intestinal lumen and/or break through and discharge from the abdominal wall Peritoneal irritation with and without frank peritonitis and/or peritoneal seropurulent or purulent evudate occurs

Rectal fistulas form frequently In bad and/or extensive cases, the patient becomes very anemic and the general condition deteriorates markedly and progressively, transfusions of blood are necessary repeatedly, and in the unfavorable cases death occurs from the debilitating effects of the long, drawnout illness. In any event, the various laboratory tests which are available are not productive of any diagnostic differentiating aid because in this group the tests all result negatively.

One of my earliest cases was remarkable because all the above bizarre manifestations occurred in this patient Within a space of four or five years there occurred (1) an ileocecal resection for the primary granuloma which followed a previous acute gangrenous appendicitis with abscess, (2) an acute pentonitis with seropurulent evudate undoubtedly due to a pinpoint perforation which defied discovery during the exploration, (3) a recurrence of the granuloma in the transverse colon which was successfully resected, and (4) several episodes of localized abdominal pain referable to the remaining large intestine accompanied by the development of a mass, 1 e, an abdominal abscess which spontaneously cured itself by discharging into the intestine Later there were numerous episodes of diarrhea which subsided and then recurred again During all these manifestations, while the patient was below par and much too thin, his general condition remained good

In those who are subjected to surgery, the pathology involves a large mass of tissue in which it is difficult to differentiate the individual parts. The mass must be resected in toto

The true nature of the pathology becomes apparent in postoperative examination of the specimen. The characteristic elements of the histologic picture include an overgrowth of chronic fibrosing inflammatory tissue and the presence of the foreign body type of giant cells

In both acute and, more commonly, in the chronic cases giant-cell systems are seen in the histologic sections. They approach and are frequently distinguishable with difficulty from those of tuberculosis, but the tendency to retrogress without excessive scarring and the absence of caseation and acid-fast bacilli in them contradict this. They are usually

*The term nonspecific as used in this communication is intended to convey the thought that the essential cause of the glandular enlargement under discussion is not specifically known at the time of writing. The term might be better paraphrased as nonclassifiable

found associated with severe infection of the alimentary canal accompanied by necrosis. Inasmuch as in the much milder form of nonspecific adentis only a hyperplastic condition is present in the lymph nodes, indicating a correspondence of intensity of process between the lymph-node picture and the picture in the intestinal tract, it must be assumed that the differences in anatomic pictures are caused by the different gradations of toxicity of the cause or of the size and intensity of the dose of the causal agent which is delivered

One must also assume that the so-called "tubercle" arrangement can be found not only in specific forms of infection, like tuberculosis and lues, but also in forms of nonspecific infection in which, up to the present time, no definite cause can be assigned

It might very well be that this sort of picture represents the anatomic progression between simple forms of lymphadenopathy on the one hand and those of definitely specific anatomic pictures, which are customarily correlated less often with lues and especially with tuberculosis Undoubtedly, this also explains the confusion which occurred, not only in the earliest historical period of this subject, but even in later times, in classifying all forms of enlargement of the mesenteric glands as tuberculosis

The cases in group C are well illustrated in the experience reported here, in which a characteristic histologic picture was demonstrable in the glandular and periglandular extracolonic mass. These histologic pictures definitely are similar to those seen in the intestinal granulomatous lesions.

It seems, therefore, that one must accept the conclusion that the lymph gland lesions are direct extensions of the one in the alimentary tract and that they are of a similar order and a pathogenic origin. In other words, we were dealing with a nonspecific granulomatous infection of the lymph nodes. The unusual feature is that the intestinal lesion has healed and has recurred and continued in the associated lymph nodes.

This conclusion is supported by the experience of Hadfield ¹ In regional lymphadenopathy occurring with regional ileitis, clear-cut specific formation of giant-cell systems identical with that found in the thickened submucosa was demonstrated. In the apparently older lesions, the giant-cell systems were more and more difficult to find and were replaced by a picture of a simple nonspecific lymphadenitis.

Summary

An experience is reported in which a nonspecific granulomatous lesion of the cecum and ascending colon was cured by resection of that portion of the alimentary canal with recurrence and continuation of the same nonspecific granulomatous lesion in the associated intra-abdominal lymph nodes

References

The term 'chronic' refers to a clinical syndrome which has lasted continuously for a relatively long time, or which has occurred as a succession of episodes interrupted by periods of lesser intensity and, perhaps at times almost completely disappearing. The appearance of such episodes must under such definition be interpreted as acute or subacute exacerbations of the underlying cause and disease. In actual clinical practice this is the commonest course of events following an initial 'acute' attack

SPONTANEOUS RUPTURE OF THE UTERUS IN A FOUR MONTHS PREGNANCY

GEORGE KNAUER, JR, MD, New York City*

(From the Department of Obstetrics and Gynecology St Vincent & Hospital, New York City)

THE rarity of spontaneous rupture of the uterus during the early months of gestation appears to warrant the report of such a case. It is well known that spontaneous rupture is more commonly seen in the latter months of pregnancy but the condition may occur at any time during it According to Stander 1 in the first half of pregnancy the accident is due usually to pregnancy in the interstitial portion of the tube or in a bicornate or infantile uterus, or to excessive invasion of the uterine wall by fetal elements. In the last months it is usually associated with the presence of scar tissue in the uterine wall Thus, the condition is seen in cases of previous cosarean section and in cases of uteri proviously per forated or otherwise injured during curettage or other operative procedure. Some consider lack of hypertrophy of the uterine wall in the region of the fundus to be a contributing factor

Gepfort reported a case in which the scar of a provious low cesarean section evidently ruptured early in pregnance as a result of trauma. Schaffer's case was reported due to diffuse adenomy emetritis a Baisch collected 70 cases of rupture of the uterus in which 31 occurred before the fifth month. Schenk and Rader in 1941 presented a case of spontaneous rupture of the uterus in the fourth month of pregnancy in which rupture took place in the region of the right cornu at the site of a salpingectomy performed six months previously in 1936 Jule reported a case of spontaneous rupture of the uters in the fourth month occurring in a uterus containing multiple fibromyomats.

Case Report

A 31 year-old married colored woman whose last menstrual period was June 18 1915, and whose expected date of confinement was March 25, 1946, entered the emergency room at 8t Vincent a Hospital on October 11 1945 complaining of severe generalized abdominal pain of five days duration. The pain began auddenly in the epigastrium five days before admission subsequently involved the whole abdomen and was accompanied by nauser and vomiting. The pain then abated and was almost absent for three days, only to return again in a more severe form on the day of admission when slie again vomited. She had noticed a mucoid vaginal discharge since the onset of pain. There was no vaginal intelligible and the substantial of the property of the substantial of the substantial that and the substantial of
The patient had had her has bady hine years before She gave no history of trauma or accident to herself and had never had an operation. About one week before the onset of her present illness, she visited her private physician for a routine prenatal check up. He reported that he had found a normal intrauterine pregnancy that the patients blood

pressure was 120 systolic, 80 diastolic and that her unnalysis was negative.

Physical examination revealed a well nourished well-developed patent, acutely ill. Her tempera ture was 98 8 F. pulse, 92 and blood pressure, 64 systolic 42 diastolic. The tongue was dry but dean and the extremites cold. The lungs were clear to percussion and auscultation. The heart was normal in size with regular sinus rhythm. No mur murs were heard. The abdomen was distended. There was generalized abdominal tenderness, more pronounced in the upper quadrants than in the lower with moderate rebound tenderness. It was impossible to outline the uterus or fetal parts. The fetal heart was not heard. Pelvic examination revealed a relaxed pelvic floor moderate tenderness in both fornices and in the cul-de-sac. The cervix was soft, patulous, tender on motion, mildly croded and lacerated bilaterilly. On rectal examination no masses were felt but there was tenderness throughout.

Blood studies showed 62 per cent hemoglobin (Salii) 3 400,000 red blood cells 18 000 white blood cells with a differential count of 94 per cent neutrophils and 6 per cent lymphocytes. Analysis of a catheterized specimen of urino (after an infusion of 5 per cent glucose in normal saline) revealed a specific gravity of 1 010 acid reaction, 1+ albumin 4+ sugar negative acetion occasional red blood cells, 8 to 10 white blood cells, and occasional hyaline and spithelial casts per high power field. Blood sugar was 115 blood type 0 and Rh factor, positive

Blood Kalin test was negative

A diagnosis of intra abdominal hemorrhage was made with a tentative impression of bleeding ab-

dominal pregnancy

X rays of the abdomen revealed the presence of a fetal skeleton in the early months of gestation in the normal position. While the x rays were being taken the patient fainted twice. She was treated symptomatically for shock and received 1,500 cc of a 5 per cent glucose solution in normal saline by slow infravenous drip while the blood typing and cross matching were being done. Following the infusion a blood count showed that the hemoglobin had dropped to 50 per cent and the red blood cells to 2 450 000.

A surgical consultation acknowledged the possibility of abdominal hemorrhage and also mentioned acute hemorrhage pancreatitis as a possibility However blood amylase determination was 73

Bodansky units (normal 40 to 170 units)

The patient's condition became worse and abdominal distention increased somewhat She was

dominal distention increased somewhat She was given 500 cc of whole blood intravenously Under cyclopropane and oxygen anesthesia laparotomy was performed by Dr Thomas Lavell chief of Service About two quarts of clotted and fresh blood filled the abdominal cavity. The uterus was enlarged to the size of a four months gestation. The tubes were inspected immediately and found to be normal. When a hand was passed around the uterus a rent was discovered on the posterior aspect near the left cornu. The rupture, which was about 6 cc in length included all layers except the amnotice membrane. A high supracervical hysteres.

Now a first lieutenant of the Army Medical Corps Aberdeen Maryland

tomy with a right salpingo-oophorectomy was per-The dead fetus was extruded through the uterine defect before the hysterectomy was done After the raw surfaces were reperstonealized, the

abdomen was closed in the usual manner

Toward the end of the operation, the blood pres-are and pulse were unobtainable. Ten cc. of sure and pulse were unobtainable adrenal cortate were given intravenously, the transfusion of whole blood which was being given throughout the operation was continued, and an additional infusion of 5 per cent glucose in normal saline was The patient remained in Trendelenburg position and was kept in the operating room for one and a half hours At the end of this time, she was returned to the ward in fair condition—with a pulse of 104 and a blood pressure of 130/70

She received 560,000 units of penicillin to counteract the possibility of pneumonia All sutures were removed on the ninth postoperative day thirteenth postoperative day, a small furuncle on the right buttock was incised and drained patient was discharged in good condition on the sixteenth postoperative day The blood count showed 75 per cent hemoglobin and 3,200,000 red blood cells

Pathologic Report -The specimen was an enlarged. irregular uterus weighing 495 Gm and measuring 15 by 6 by 7 cc Present in the fundal region was a large rent in the wall through which the fetal surface of the placenta could be seen, and through which an umbilical cord protruded The placental site extended from the perforated portion down to the lower portion of the uterus The myometrium varied in thickness, being thin about the site of rupture and gradually increasing in thickness as it approached the lower portion of the uterus. The overy was enlarged and its surface wrinkled

Microscopic Examination —Microscopic section through the myometrium at the site of thinning revealed considerable round cell infiltration of the

musculature

HISTAMINE AND ANTIHISTAMINIC AGENTS

The recognition of the role of histamine in the mechanism of anaphylavis and its probable role in allergy has led to various attempts to diminish the action of this poison That an increase in tolerance to histamine cannot be expected from injections of histamine is supported by the preponderance of experimental evidence in animals and man

The enzyme histaminase lacks an inhibiting or neutralizing effect on histamine in the living animal and does not evert a specific action on anaphylaxis The evidence for an increased tolerance to histamine and for a resulting specific antiallergic action from the injection of histamine-azoprotein is

doubtful

In the last few years histamine antagonists of various types have been tried in histamine shock, anaphylaxis, and allergy The amino acids, histidine, cystine, and arguine, were found too weak in their action and too toxic. The early French synthetic compounds proved fairly active in histomine and anaphylactic reactions but were too touc for clinical use

The more recent antagonists of histamine are chemically related and have some degree of clinical usefulness These are the French compounds, antergan (n'phenyl-n'benzyl-n-dimethylethylenediamine) and neoantergan (N-p-methoybenzyl-Ndimethylaminoethyl a aminopyridine) and the American compounds, benadryl (B-dimethylamino ethyl benzhydryl ether) and pyribenzamine (n'pyridil - n'benzyl - n - dimethylethylenediamine) Benadryl and pyribenzamine are useful sympto-

matic remedies in the treatment of the urticaria dermatoses, atopic dermatitis (flexural and infantile atopic eczema), reactions to penicillin and sulfonamide, some other types of dermatitis, and seasonal hay fever. In the latter syndrome the order of effectiveness of the antihistaminic drugs 18

pyribenzamine, neoantergan, and benadryl
The usefulness of benadryl and pyribenzamine against perennial vasomotor rhinitis and asthma 18 The evidence thus far indicates that more limited pyribenzamine is the more effective of the two drugs

against these manifestations

Both drugs give a high incidence of side reactions, among which sedation and drowsiness are most com-monly observed These reactions are more frequent and of greater intensity in the case of benadryl

The use of these histamine antagonists should be tempered with the following considerations. A cure or lasting improvement is not to be anticipated as a result of the action of these drugs, at best they evert only a temporary palliative action in allergic condi-Many manifestations and many patients will fail to respond to them, and others will be helped by the employment of additional palliative measures The specific allergic methods (elimination and desensitization) should not be abandoned, as at present they constitute the sole means of achieving lasting In addition to precautions against immediate toxic reactions, it should be remembered that the remote toxicity from these drugs has not been sufficiently ascertained up to this time-J A M A, November 23, 1946, p 714

ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

AT ITS meeting on April 10 1947 the Council considered various matters, taking final action or directing further study and reports as indicated under the following headings

Secretary a Report

Remission of State Assessments —The remission of State assessments was voted on account of service with the armed forces for 240 members for 1947, 171 for 1946 and 4 for 1945, also on account of illness for Drs Wallace B Dukeshire Leo Batell, Raymond Gettinger and Elsie McPeak. The refunding of dues of 24 members was authorized Dr William F Shaw's State assessment for the years 1944 and 1945 was remitted and he was restored to good standing as a member of the Medical Society of the State of New York.

On March 10 I had an interview with Mr Ralph E Smiley of Messrs Booz Allen and Hamilton Management Council to the Kenny Foundation We discussed the relationship of the National Foundation for Infantile Paralysis the Kenny Foundation and practicing physicians in regard to combating infantile paralysis.

Two days later it gave me pleasure to attend a dinner at the Hotel Commodore in honor of the rething Deputy Commissioner of Motor Vehicles, Mr Markvart.

On April 8 I had a conference with Mr Victor R. Donatelli, Assistant Field Supervisor U.S Railroad Retirement Board He explained that from Maine through the District of Columbia, with the exception of eleven western counties of Pennsylvania, their business is administered from the Regional Office at 341 Ninth Avenue New York City This Railroad 341 Ninth Avenue New York City Retirement Board grants sickness and retirement benefits to railroad employees, working through the United States Government There will be blanks The doctors will be paid for their services by the injured or sick employees

Mr. Donatelli left me copies of regulations with specimen blanks which have been given to the Journal so that the in formation can be published for the members of the Society

On Army Day April 7 with the permission of the President, I represented the Society at the Army Day Quartermaster Corps luncheon at the Hotel

Astor New York.

During the past month, your Secretary has also attended committee meetings handled correspondence and helped with reports and other matters pertaining to the Annual Meeting.

Memorial to Dr James M. Flynn

Dr Floyd S Winslow read the following resolu tion

"Wheneas our friend and colleague, James Murray Flynn, after years of loyal service to his beloved profession died on Saturday December

14, 1946 and Wheneas his was a colorful career—roentgen ologist-soldier-leader in organized medicine his ability in his chosen field of roentgenology was unchallenged, and his long years of service as chief of the x-ray departments in various Rochester hospitals brought a feeling of great comfort and security to these institutions and to their patients whom he served and

WHEREAR, he served with distinction in his special field with Base Hospital No 19 during the entire period of the First World War, and

WHEREAS, in his passing organized medicine loses a staunch worker, loyal friend and dis-tinguished leader He was President of the Medical Society of the State of New York in 1940, prior to that he had been President of the Medical Society of the County of Monroe and also of the Rochester Academy of Medicine, indicating the high esteem in which he was held by his brother practitioners and

WHEREAR his vigorous mannerisms characteristic of him covered a sympathetic and understanding nature, and over the years he became the friend and confident of countless physi-

cians, and
WHEREAS, he was a stalwart champion of the honor and exemplified its duties and responsibilities in his own daily conduct and

"Whereas his religious scal and devotion to his family were well known, and he leaves an honored name to those who survive him, therefore, be it Resolved, That the membership of the

Medical Society of the State of New York loces a distinguished servant in his passing, and mourns our loss and be it further

"Resolved That these resolutions be published in the New York State Journal of Medicine,

and that a copy be sent to Mrs Flynn.

The memorial was adopted by the members rising and standing with bowed heads in memory of their departed colleague.

Treasurer & Report Was Accepted

Report of the Executive Officer

Dr Robert Hannon reported that the legislative session ended on March 19 that the Legislative Committee had followed a large number of bills, of which 32 were sent to the Governor as thirty-day bills 15 were signed, three that we opposed were vetoed and 14 were still in the Governor's hands.

The three Griffith bills pertaining to partnership, group practice at ceters, have not been been acted on by the Governor and during this last week, through arrangements made by Dr Lottler, of Brooklyn a hearing was held with Mr Beitel, Governor Dewey's counsel. Great effort had also been made during the period following adjournment of the Legislature to place further opposition before the governor by telegraphing all of the county societies to express themselves

Activities of Committees

Committee on Legislation.-Dr H. Aranow, Chairman reported on two matters. He had re-Chairman reported on two matters. He had received a telegram and long letter from the Association of American Physicians and Surgeons William P Howard M.D president, asking for a hearing and urging us to appear against US Sonate Bill 140 He took no action on this as he felt any request of this nature should come from the American Medical Association.

The other matter was a letter and statement from Victor R Wolder, attorney and counselor at law, 521 Fifth Avenue, New York He requested that a statement entitled, "Urging the Committee on Ways and Means of the House of Representatives to Enact Legislation to Eliminate Certain Basic Inequities Existing under the Internal Revenue Code," be published in our Journal He would like us to send a representative to a joint meeting of representatives of various professional groups, such as, medical, legal, accounting, engineering, the purpose of which would be to back an organization in an endeavor to effect appropriate legislation that would eliminate certain discriminatory features of the Income Tax Law, largely caused by the fact that these professions are not permitted to incorporate After discussion,

the Chair was empowered to appoint a Committee to study the matter and report Dr Bauer appointed Dr Aranow, Mr William F Martin, and

Dr Fenwick Beekman

Committee on Constitution and Bylaws—The Council acted on two requests in regard to proposed amendments, one from Albany County, which they approved, and one from New York County, which they disapproved

Finance Committee —Dr Louis H Bauer appointed with the approval of the Council, a new Committee Dr Albert F R Andresen, as Chairman, to succeed Dr Bauer, Dr Charles M Allaben, to succeed Dr Sullivan, deceased, and Dr J Stanley

Kenney
Malpractice Insurance and Defense Board —Dr
J Stanley Kenney, Chairman, submitted the Committees' Annual Report which was discussed and approved with minor alterations

Committee on Medical Publicity —News releases concerning teaching days and other events sponsored by the Committee on Education and Public Health

were sent to the papers in 14 counties

The Seelye-Coville Bill which would have licensed chiropractors in New York State did not emerge from committee

To implement the Council resolution to recognize doctors practicing medicine fifty years or more, a questionnaire and letter was distributed. To date, over 50 doctors have stated they will attend the annual meeting banquet at Buffalo to receive the certificates. Two hundred and twenty-five others wishing to receive the certificate will be unable to attend

Routine preparations have been made for annual meeting publicity. Teaching day schedules and a condensed program were sent to county bulletins, deans of medical schools, superintendents of hospitals in New York State, and members of the Society in the Fifth, Sixth, Seventh, and Eighth District Branches

A letter from the Advisory Council of the Woman's Auxiliary requesting cooperation with county auxiliaries was sent to the Advisory Board to the Woman's Auxiliary and to secretaries of county medical societies

Committee on Medical Service and Public Relations—Dr H Aranow, Chairman, reported that a meeting had been held on March 29, 1947, of the A.M A Executive Committee of the Middle Atlantic States Conference on Medical Service, that there will be a meeting in Philadelphia on May 22 The following topics will be discussed the Present Status of the United Mine Workers Medical Health Program, organized medicine's relationship with various cancer drives, the Taft-Ball-Donnell Bill,

what is going on in the various states under the Hill-Burton Act Dr Joseph Lawrence will give "The Washington Horoscope" during luncheon The last topic will be "The Changes in the Medical Policy of the United States Veterans Administration" All those interested are invited to attend

Committee on Nursing Education—Dr W Guernsey Frey reported that the Committee on Nursing Education had its second meeting on March 20, 1947, with representatives of the State Hospital Association, the New York State Nurses Association, and two representatives of the Practical Nurses of New York, Inc (by invitation)

The meeting was devoted largely to considerations of practical nursing. A definition of a "practical nurse" was adopted as follows: "A practical nurse is a person trained to care for subacute, convalescent, and chronic patients requiring nursing service at home or in institutions, who works under the direction of a licensed physician or a registered profes-

sional nurse"

It was pointed out that in caring for the ill, especially in institutions, there is a place for nurses of all degrees of educational training, from the very highly trained professional technician down to the practical nurse, that the solution to the problem lay in employing the proper grade of nurse in the

proper role

A letter was read from the Board of Regents indicating that Regents Scholarships are available for nurses in training only if they are candidates for a bachelor's degree Mrs Kuster mentioned that the Practical Nurses' Association had a scholarship fund two or three years ago, and that it had helped recruit candidates who otherwise could not have afforded to give up work while undergoing training

It was stated that at the present time licensing of practical nurses is optional, but that such licensing will become mandatory in another year, when only one holding a license may be called a practical nurse. It then will be possible to identify all licensed practical nurses, and educational requirements may be standardized

The Council then adopted the following resolu-

tion

"Resolved, That this Coordinating Council on Nursing Problems approves the employment of practical nurses for qualified nursing duties, in hospitals, under supervision of a registered professional nurse"

Planning Committee for Medical Policies—Dr J Stanley Kenney, Chairman, reported that the Committee had drafted its report for the House of Delegates with one or two omissions which would have to be filled in after this morning's meeting of the Council

At the last meeting, the Council voted to table the recommendations made on streamlining the Council Committees until the April meeting The matter was discussed, and

It was voted to accept the following recommendations of the Planning Committee, to take effect in May, the next Society year

1 That the Committee known as the National Casualty and Indemnity Insurance Committee be discontinued

2 That the Committee on Revising the Principles of Professional Conduct, having functions parallel with the Committee on Questions on Ethics, have these functions transferred to the Committee on Questions on Ethics

That the Subcommittee on Woman Medical Student and Intern set up by the House of Delegates at the time of the war emergency, does not have any special function now and it is recommended that this subcommittee be transferred to the Committee

on Public Health and Education

4 That the Advisory Committee on Ophthal mological Problems set up a few years ago when special legislation concerning optomotrists was being pressed be discontinued and it is recommended that a suggestion be sent to each scientific section that it set up a committee to be available for consultation with Dr Hannon, if and when legislative problems arise

That the name of the Council on Medical Service and Public Relations be changed to the

"Committee on Medical Service

6 That the Committee on Public Relations and Economics be known as the "Committee on Economics.

That the name of Committee on Medical Publicity be changed to Committee on Public Relations.

Committee on Public Health and Education -Dr O W H Mitchell, Chairman reported as fol

Saturday March 29, 1947 In New York City a meeting of the Council Committee on Public Health and Education and the Subcommittee on Mental Hygicne was held Present at this meeting in ad dition to the Committee members were some of the officers of the Medical Society of the State of New York and the Commissioner of Mental Hygiene of the State of New York

On motion of Dr Mitchell seconded by Dr Aranow it was voted that the Public Health and Education Committee and its Subcommittee on Mental Hygiene prepare a report on the mental hygiene program now developing in New York State to be submitted to the House of Delegates at the May meeting in Buffalo

Wednesday April 9, 1947 In New York City a meeting of the Council Committee on Public Health and Education and the BCG Advisory Committee to the Medical Society of the State of New York and the New York State Department of Health was held In addition to the Committee members, officers of the Medical Society of the State of New York and representatives of the New York State Department of Health were present

A report is being prepared to be submitted to the House of Delegates

Also on this same day in New York City the Council Committee on Public Health and Education met with members of the Maternal Welfare Subcom mittee. Representatives of the State Department of Health and some of the officers of the Medical Society of the State of New York were present

The question of colored movies and the building of a film library in connection with our postgraduate education program was discussed. The idea is to develop if it can be done a good film library in which the State Society and the Department of Health

would participate

A meeting of the Council Committee on Public Health and Education and the Council Committee on Legislation was also held on this day to consider the training and licensing of physiotherapists in the State of New York. Present at this conference in addition to the Committee members, were some

of the officers of the Medical Society of the State of Now \ ork and representatives of the State Departments of Health and Education.

After discussion.

It was decided to recommend to the Council that a carefully selected committee be appointed a Subcommittee under the Committee on Legisla tion and Public Health and Education to study the law and prepare material to assist the State Department of Education to frame a bill

The Council discussed this recommendation and roted to appoint a Subcommittee on Physical Medicine of the Committee on Legislation and the Committee on Public Health and Education, the appointments to be made in May in Buffalo by

Dr Bauer

Child Welfare.—The Chairman of the Subcommittee on Child Welfare Dr Paul W Beaven, has submitted a report with a considerable number of suggestions regarding the care of premature children. In the near future a meeting of the Council Com-mittee on Public Health and Education and the Subcommittee on Child Wolfare will be held to consider these suggestions.

Postgraduate Education.-Postgraduate instruction has been completed in the following county medical societies Cattaraugus Chenango Clinton Fulton Onondaga, Richmond and Rensselaer

Postgraduate instruction is being given in the following counties Cortland Jefferson, Madison Nassau, Oneida, Rockland St. Lawrence Sullivan, Tioga, Ulster and Wayne.

Requests for instruction have been received from Oswego Tompkins, and Steuben and arrangements are being made

Arrangements are being completed for the follow ing Regional Teaching Days to be given

County	Genesse	Subjects Miscellaneous	Date Giren April 9 1947

Committee on Public Relations and Economics.— Dr Carlton E Werts Chairman, requested Mr George P Farrell, Director Bureau of Medical Care Insurance, to report on activities of the Bureau which he did as follows

March 19, 1947 Mr Farrell met with Dr A H Aaron Chairman of the Subcommittee on Medical Expense Insurance in Buffalo to make arrangements for the Subcommittee meeting to be held in New York April 4 Final details were completed for

New 10th April 4 Final details were completed for a display sign at the Annual Meeting March 24, 1947 The Director attended a forum on 'Shall Medicine Be Socialized' held at the Bellerose High School Bellerose, on invitation of Dr Frank R. Burberg of Queens County March 25, 1947 Mr Farrell conferred with Mr Handalth accounts meeting of the

Thomas Hendricks, executive secretary of the

Council on Medical Service of the A M A, regarding seal of acceptance for medical care plans in New York State

March 27, 1947 Mr George Smith, director of Associated Medical Care Plans, discussed with the Director, membership of New York State plans in AMCP

A meeting was held with Mrs Michael Schultz, Chairman, Program Committee, Woman's Auxiliary, concerning the work done by her committee for the

Bureau during the past year

A meeting was held with Dr Van Etten, Chairman of the Board of Directors, United Medical Service, and Mr Frank Smith of A M C P, regarding affilia-United Medical Service in Associated tion by

Medical Care Plans

April 2, 1947 On invitation of Dr Robert Hannon, Mr Farrell attended a hearing in Albany at the office of Counsel to Governor Dewey, Mr Charles D Breitel, on Senate Int bills 740, 741, and 742 Also present were Dr Aaron Kottler and Mr Whelan, legal counsel for Kings County Medical The Bureau is particularly interested in these bills as they have to do with an amendment to the Education Law in relation to the right of corporations organized under article 9-c of the Insurance Law, to employ or contract with physicians to provide medical services to insured persons

Mr Farrell presented a report covering the progress of the New York State voluntary nonprofit

medical care plans for the year 1946

Dr Wertz presented standards to be required of voluntary nonprofit medical care plans in order to obtain approval by the Medical Society of the State of New York After discussion,

It was decided that these standards be incorporated in Dr Wertz's report to the House of Delegates, for final action

Dr Wertz presented an analysis of the Health Insurance Plan of Greater New York, made by Mr Farrell, and

It was decided to incorporate this report in the

Council Minutes

Publication Committee -Dr George W Kosmak, Chairman, reported that the Committee had its regular meeting on April 3, there had been several meetings of the Editorial Committee to discuss editorial and allied matters, that the Publication Committee was very happy to have had Dr Bauer present at their regular meeting, as he would gain a more thorough acquaintance with the activities of the office and publication matters than could be secured from re-Dr Kosmak hoped the Directory would be ready for distribution by the first of June, and that it might be possible to have some unbound copies at the Annual Meeting, that the Committee had decided to develop an exhibit similar to that of last year, and to provide a box for comments by visitors, and that there would be an attendant at the exhibit throughout the Annual Meeting

Committee on Liaison with Veterans Administration —Dr Anderton reported that Dr Bauckus was unable to attend the Council meeting, and read a letter from him which gave instructions regarding the comparative fee schedules being prepared at the State Society's office Dr Anderton stated that these schedules would be ready in a day or so, and would be sent to Dr Hawley in Washington

Woman's Auxiliary —Dr James R. Reuling, Chairman, Advisory Committee to the Woman's Auxiliary, reported that the President, Mrs Madden, and Mrs Galster, had attended organization meetings of Richmond, Allegany, Steuben, and Tompkins county auxiliaries, that Bronx County was not ready to be organized, that Cheming County did not wish to take up the question at this time, that no response had been received to letters sent to Clinton, Franklin, Schoharie, or Otsego counties, that twelve counties had been fully organized this year

Mrs Madden conferred in Rome with Mrs Bradford F Golly, Press and Publicity Chairman, on material to be used in the new Auxiliary publication The Distaff, and conferred in Buffalo with Mrs Kenneth & Jahraus, Convention Chairman, and Mrs Arthur L Bennett, Exhibits Chairman The President and Mrs Harry F Pohlmann, Presidentelect, attended the Pennsylvania State Conference of County Presidents in Harrisburg, Pennsylvania. Much valuable information on the subject of councillors and branch auxiliaries was gathered "We are also pleased to report that they are enthusiastic over 'Check and Double Check,' and apparently are using it extensively" The President addressed Kings County Auxiliary in Brooklyn, and the

Chautauqua County Auviliary in Jamestown
The Legislative Chairman, Mrs Gerald C
Cooney, Syraguse, has talked before five county auxiliaries Most of the auxiliaries have had Legislative minutes Letters were sent by the different county auxiliaries to their representatives in the Legislature protesting against the Chiropractic Bill, the Podiatry Bill and the Medical Partnership Bill

A recommendation Competent speakers in the Auxiliary be utilized under the State Society's new Public Speaking Program (They can be used in small spots, and if their expenses were paid, they might be willing to do it) Mrs Gerald C Cooney, of Syracuse, and Mrs Luther H Kice, of Garden City, are excellent, capable, and trustworthy speakers, and it would pay the State Society to keep them in mind

Many auxiliaries worked on the Pediatric Survey

Committee on Workmen's Compensation -Dr M J Dattelbaum, Chairman, reported as follows An examination in radiology for candidates in the metropolitan area was held on March 25

Your Director participated in arbitration of medical bills in White Plains on March 28, 1947

Increase in Fee Schedule The Committee appointed by Miss Mary Donlon, Dr Nathan B Van Etten, Chairman, to consider the proposed fee schedule held a meeting on Thursday, March 27 The committee heard representatives of the insurance carriers organization and of the Associated Industries of New York State present their views concerning the effect of the proposed fee schedule on the cost of workmen's compensation medical_care and on premiums and other related matters Chairman and Director discussed these matters, and arguments for the adoption of the fee schedule were presented The Committee gave special consideration to the first few items in the fee schedule, namely, the first office visit, the first home visit, subsequent office and home visits, leaving for later discussion the various operative and special fees and also the question of the period of after-care to be included with operative fees A strong plea was made by your representatives for a report by the Committee before the Annual Meeting in May Committee scheduled another meeting for Thursday, April 17, 1947

Albany County Resolution On March 10 1947, we received a resolution adopted by the Medical Society of the County of Albany in part reading as follows

"WITEREAS, the Medical Society of the County of Albany and numerous other county medical societies of the State of New York have repeatedly, and without success sought an increase in the Workmen's Compensation fee schedule of the State of New York to bring it more in harmony with the sharp rise in costs of the practice of

'Therefore, be it resolved That the members of the Medical Society of the County of Albany do hereby agree that on and after May 15 1947 they will consider the existing fee schedule as a mini mum schedule only and that on and after May 15 1947, they will make charges in all new compen sation cases coming under their care after that date, based upon the present day standards of medical costs. They further agree to submit to arbitration all such bills as are disputed by the

And be it further resolved That the delegates from this County to the annual meeting of the House of Delegates of the Medical Society of the State of New York to be held in May 1947 be instructed to aid in every way the State Compen sation Bureau in its efforts to secure the proposed

changes in the fee schedule

Since the adoption of this resolution we have had inquiries from many county medical societies as to what policy they should pursue in relation to the delay in the promulgation of a new fee schedule have advised them that your committee and your Director have taken all necessary steps to forward the interests of the medical profession in relation to the fee schedule A chronologic review of the ac tivities of this Bureau will show that steps have been taken and recommendations made to the Depart ment of Labor for an increase in the fee schedule and for the removal of the 5 per cent discount for pay ment of medical bills within thirty days of their sub-mission since 1940 1941 Recommendations have also been made to the House of Delegates which resulted in resolutions calling upon the Department of Labor to increase the fee schedule and to remove the five per cent discount. Surveys of fees throughout the United States have been made and material collected from every county in the State to support our request for an increase in fees.

The insistent demand on the part of the profession and more particularly on the part of county medical societies for a more adequate fee schedule should not o unheeded and should be made known to the Chairman of the Workmen's Compensation Board.

The determination of the Albany county phy sicians to submit bills in excess of the minimum fee schedule after May 15 1947 and in accordance with present day standards of costs and to 'submit to arbitration all such bills disputed by the carriers and employers will bring up for consideration the provisions of Section 18 of the Workmen s Compen-sation Law This section states The amounts payable by the employer for such treatment and services shall in no case be less than the feet and charges established by such schedule Nothing in this schedule however shall prevent voluntary payment of amounts higher than the fees and charges fixed therein but no physician rendering medical treatment or care may receive payment in any higher amount unless such increased amount has been authorized by the employer or by decision as

provided in section thirteen-g herein Section 13-g provides for arbitration of medical bills. If said bills are objected to within thirty days after their submission to the employer or insurance carrier in a compensable case the employer or carrier is entitled to an impartial examination of the fairness of the amount claimed It would seem that a physician would be within his rights in requesting authoriza tion for a fee in excess of the minimum, and failing to receive such authorization to submit to arbitra tion the issue as to the fairness of the amount of the The failure of the employer or insurance carrier to authorize or to pay voluntarily a higher amount than the minimum would not debar the physician from having the fairness of the amount of his bill decided by an arbitration committee

State Employed Physicians We wish again to bring to the attention of the Council that we were advised by the Chairman of the Workmen a Compensation Committee of the County of Livingston on October 12 1946 that the Chairman of the Workmen's Compensation Board had refused to authorise a physician in said county who was em ployed by a State institution, on the ground that the physician was employed by the State of New York and it was the policy of the department that no physician be authorized to render medical care under the Workmen's Compensation Law while he is in the employ of the State "because physicians who treat compensation claimants are required to appear and testify at referee and board hearings, a duty that might and doubtless would conflict with

State duties and responsibilities

We addressed a letter to Miss Mary Donlon on October 21 1946 asking for information concorning the reasons for her failure to authorize a physician recommended by the Committee on Workmens Compensation On October 25 1946 Miss Donlon replied that there was no professional opprobrium attached to the failure to authorize these physicians. She stated 'there is a duality of duty that could interfere with the most satisfactory performance of both and, in their case, both duties are owed to the State which therefore has a direct concern in the matter A State doctor has exacting duties to those for whose care the State engages his services and the exactions of workmen's compensation practice and attendance at referee and board hearings. sometimes in distant points might involve such a conflict of duties as to be detrimental to the highest standard of professional responsibility in either or both connections.

An opinion by the Attorney General in 1943 stated that any employee of the State has a right to work for employers not connected with the State and receive compensation therefor provided such outside work does not interfere with the performance of his duties

At about this time we received a communication from Dr Irving M Derby Director of Laboratory at the Newark State School Wayne County who was also affected by this decision and who was refused an authorization of SI. (pathology etc.) by the Chairman of the Workmen's Compensation Board Dr Dorby stated, among other things that for the past twenty years while working for New York State he had appeared and testified before referees and at board hearings a duty which did not conflict with his State duties or responsibilities and a procedure which met with the approval of his superior officers. His duty as laboratory director required him to act as a clinical pathologist for

physicians in Wayne County As laboratory director in the county the physicians in the county frequently must rely upon him for laboratory services in private and compensation cases. The refusal to grant him SK rating necessitates the physicians of Wayne County sending patients outside of the county for laboratory work. He protested the ruling. On March 7, 1947, a letter was addressed to Miss Donlon referring to the consequences of failing to authorize and qualify Dr. Derby and asking for a conference with Miss Donlon to discuss this matter.

A similar letter refusing authorization was received by Dr H G Hubbell, acting director of the Newark State School, in Newark, New York school is a subsidiary of the Department of Mental Up to the present date, Miss Donlon has Hymene

not replied to our letter

On February 20, 1947, a letter was addressed to Dr Frederick MacCurdy, commissioner of mental hygiene, requesting him to outline the policy of his department in relation to physician employees of the State examining or treating compensation claimants and referring to the action taken by the Chairman of the Workmen's Compensation Board in refusing to authorize such physicians. On April 1, 1947, Dr. MacCurdy replied stating that he had a conversation with Miss Mary Donlon and that it was not very conclusive It was for this reason that he delayed making a statement as to his attitude pre-It was his opinion that the physicians in the employ of the State in his department should be permitted to participate in compensation work particularly in the upstate areas where no other psychiatrists are available. The position of the Department of Mental Hygiene being clarified, it becomes essential to take up the matter with Miss Donlon in view of the position she has taken in denying ratings to employed physicians of the State of New York

New Business

Dr Bauer presented Dr Henderson of the Board of Trustees of the American Medical Association, and stated that he and the doctor were flying to London that afternoon

The Council by a rising vote wished President

Bauer and Dr Henderson a bon voyage

STATE CRIPPLED CHILDREN'S PROGRAMS

Care for the crippling conditions many of the children suffer from accidents is provided under the State crippled children's programs, for which Federal funds are granted under the Social Security Act These programs are administered by State crippled children's agencies under plans approved by the US Children's Bureau Many of the children so treated are the victims of burns, and plastic surgery is sometimes necessary Some who have been crippled or maimed are fitted with artificial arms or limbs, or with crutches

The treatment is often given over long periods. and includes medical, hospital, and nursing care Often, arrangements have to be made for occupational training of the boy or girl whose opportunities may be limited as the result of the permanent handicap from the accident Sometimes, a home problem has to be dealt with, in which case a medical-social worker may be called on for assistance In some cases, special arrangements have to be made for the child's schooling, and, in such instances, the crippled children's agency assists

A diagnosis of the case is arranged for at a crippled children's clinic Some of these clinics are so-called "permanent" clinics held in the same place—a hospital or health center—at regular intervals clinics are "itinerant"-the clinic staff goes into rural areas If a child is acutely in need of care, the physician may provide care in the child's home

In all instances the examination and diagnosis of the injured child is made without charge and without regard to the family's financial circumstances After it is known what care is needed and what it is likely to cost, then, as the program is operated by the State, consideration may be given to the ability of the family to pay for the recommended treatment Usually the cost of care for children with crippling conditions is too high for families of even moderate means to pay for and the State agency furnishes the needed services from State and Federal funds

One of the problems, the Children's Bureau states, is to find these children, for often their parents do not know that the service is available Security Act, under which these programs have been developed, specifically lays upon the administrating agency responsibility for locating "all children who are crippled or who are suffering from conditions that may lead to crippling"—an unusual injunction—Federal Security Agency, Social Security Administration, U.S. Children's Bureau

DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL, DIRECTOR

United Medical Service, Inc., New York City

This is the third in a series of histories of nonprofit voluntary medical insurance plans operating in New York State

THE rapid growth of United Medical Service now second in size among the nations nonprofit medical and surgical plans Indicates increasing public acceptance of the voluntary way of pre-paying for medical care Established in 1944 as a result of the union between Community Medical Care and the Medical Expense Fund of New York the doctor's plan has more than doubled its membership in each succeeding year and has gained the cooperation of at least six out of ten physicians in the area it serves.

From the standpoint of progress UMS has more than fulfilled the promises made to the public by The most outstanding deits original sponsors. velopment has been the agreement of its partiel pating doctors to accept UMS payments as full compensation for services to members in the low income brackets. The recent increase in Indemni ties toward doctor a fees for surgical and maternity care was another milestone in UMS progress. To more than 325 000 subscribers covered by the surgi cal plan the increase was particularly welcome

UMS statistics alone present an impressive record of accomplishment. With a nuclous of approximately 30,000 members carried over from the parent organizations, the plan was able to achieve a total enrollment of 79,404 by December 1944. At the end of 1945 the total was 161 128 By December 1946, it had risen to 405 744, an increase of 152 per cent over the previous year's enrollment, and according to present estimates the public continues to join the organization at an equally impressive rate

join the organization at an equally impressive rate. Further evidence of progress is apparent from the fact that 18,866 bills amounting to \$800,641 00 were paid in 1946 on behalf of members for medical surgical, maternity, and specialist care, as against 7,277 bills amounting to \$434,826 65 the previous year. Since the plan was reorganized, 27,098 bills amounting to \$1,320,318.26 have been paid. United Medical Service is approved by the Medical Society of the State of New York and seven-ten causely medical societies in its apprentice are

teen county medical societies in its operating area. Nearly 12 000 physicians participate—In four of the ounties covered participating physicians represent 100 per cent of the medical profession engaged in active practice. This wide-scale cooperation of the medical profession eneans that practically all UMS members are able to retain the services of their fault. family physicians while reaping the maximum benefits the plan provides.

From the beginning UMS has operated under the guidance of Howland H. George president and board member The board of directors comprises Dr. Nathan B. Van Litten chaltman, Dr. Charles Gordon Heyd, vice-president Dr deWitt Stetten secretary John S. Linen, treasurer and ten other physicians including Drs. Harry Aranow Thomas M. D'Angelo Chester O Davison. M. J. Frin physicians including Drs. Harry Aranov Thomas M D Angelo Chester O Davison, M J Fein Milton J Goodfriend, David J Kaliski, John J Masterson M deM Touart, I Ogden Woodruff and Irving Wright Nonmedical members of the board are William C Breed Jr Edwin S. Burdell, Arthur Huntor John S. Linen Rev Francis P Lively, Walter Mitchell, Jr. Stanley Resor, Jane Todd and Charles A. Vos. Dr Frederic E. Elliott is director of medical services. Vice-presidents are Frank Van Dyk, Harry Sesan Paul Drescher and Alan B Thompson

At the end of 1946 UMS had assets of \$1 500 000 represented almost entirely by each or government bonds After liberal reserves were set aside to meet the requirements of the Insurance Department of the State of New York the not surplus totaled approximately \$775 000

UMS offers persons covered by Associated Hospital Service, New York's Blue Cross Plan, three different types of insurance—the surgical plan, the surgical medical plan and the general medical plan for home office, and specialist s care

The low-cost surgical plan most widely patron ized of the three pays specified amounts up to \$225 toward physician's fees for surgical operations, maternity care, and the treatment of fractures and dislocations for members who are hospitalized. Monthly rates for this service are forty cents for an individual, \$1 00 for a husband and wife and \$1.80 for a family

The surgical medical plan provides all the benefits of the surgical plan plus payment of specified fees for medical care in the hospital and the payment of \$10 toward a specialist s consultation fee when the patient is referred by his doctor to a qualified spechalist. UMS defines a specialist as a physician who has been certified by an American Board of Specialists or by a county medical society, or a phy sician who is chief of a special service of an approved hospital. Monthly rates are sixty-four cents for an individual, \$1 36 for a husband and wife and \$2 36 for a family

The general medical plan provides all the benefits described above, and, in addition, payments toward doctor's fees for medical care in the home and office. When a member of UMS visits the doctor's office an allowance of \$2 a visit will be made toward the fee When the doctor visits the patient at his home or in the hospital \$3 a visit is allowed. In either case allowances will be made for as many as twenty visits for each single injury illness or pregnancy Additional visits may be authorized by UMS. The general medical plan also provides for scheduled amounts toward the fees of qualified specialists in cases where UMS members are referred to them

by participating physicians.

This plan costs an individual member \$1 60 a month and a family \$4 a month It is available only to employed groups of five or more persons in organizations where the employer contributes to

the subscription costs.

Through arrangements with medical societies in the seventeen counties covered by UMS, participating physicians have agreed to accept payments made by the plan as full compensation for services to an individual with an income of \$1,800 and families with an income up to \$2,500 The physiclans may make an additional charge to members with a higher income

> ALFRED L. GOLDEN Public Relations Director United Medical Service

POSTGRADUATE MEDICAL EDUCATION

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the Journal. The members of the committee are Oliver W H Mitchell, M D, Chairman (428 Greenwood Place, Syracuse), George Baehr, M D, and Charles D Post, M D

Queens County A Cancer Teaching Day will be sponsored on Friday, May 16, by the Queens County Cancer Committee, the Medical Society of Queens County, the New York City Department of Health, the Medical Society of the State of New York, and the New York State Department of Health. Division of Cancer Control

A clinical program will be given from 1 00 until 2 30 r M Friday afternoon at Queens General Hospital, 164th Street, Jamaica Dr Leonard Goldman, chairman of Tumor Conference, Queens General Hospital, will speak on "A New Method of

Teaching Cancer "

The afternoon and evening meetings, beginning at 3 00 PM and 8 30 PM, respectively, will be held at the Queens County Medical Society Building, in Forest Hills Chairman of the afternoon meeting will be Dr Goodwin A Distler, and speakers will be Dr Albert F R Andresen, professor of clinical medicine, Long Island College of Medicine, Brooklyn, whose topic is "Gastrointestinal Cancer," and Dr Howard C Taylor, Jr, attending surgeon, Memorial Hospital, New York City, who will speak on "Recognition and Treatment of Pelvic Cancer"

At the evening meeting speakers will be Dr Sture Osterlind, director of Cancer Research, Swedish National Cancer Institute, whose subject will be "Cancer Control in Sweden", Dr Maurice will be "Cancer Control in Sweden", Dr Maurice Lenz, professor of clinical radiology, College of Physicians and Surgeons, Columbia University, "The Role of Padrition The "The Role of Radiation Therapy in the Treatment of Cancer and Allied Diseases", and Dr Lloyd F Craver, assistant professor of clinical medicine, Cornell University, Medical College, "Recent Advances in the Treatment of Lymphomas and Leukemias"

Advance reservations for the dinner, to be served at the Queens County Medical Society Building at 6 30 PM, should be made with the Society The memberships of the medical societies of Kings,

Queens, Nassau, and Suffolk counties are invitattend the meeting

Cayuga County A symposium on hyperte: will be held at 8 00 P M on Wednesday, May : the Osborne House, in Auburn Medical treat will be discussed by Dr Herman O Mosenthal, Graduate Medical School, Columbia Universand Surgical Treatment by Dr J William Hi clinical professor of surgery, College of Physic and Surgeons, Columbia University, and asso professor of surgery, New York University, Co of Medicine

On Thursday, June 19, at 8 00 PM at the borne House in Auburn, Dr Albert D Kaiser, fessor of child hy giene at the University of Roche School of Medicine and Dentistry, Rochester, speak on "Preventive Medicine as a Part of

General Practice of Medicine

Saratoga County "Rheumatic Fever-R matic Heart Disease," will be the subject of a lec presented to the Society by Dr J G Fred E professor of clinical medicine at Syracuse Univers College of Medicine, Syracuse, on May 22 instruction will be given at 4 00 PM at Newman Lake House, Saratoga Springs

Seneca County Dr Ferdinand J Schoen professor of clinical obstetrics, Syracuse Univers College of Medicine, will lecture on "Gynecolog General Practice," on May 15, at 2 00 PM meeting will be held at the Armitage Tea Rc Seneca Falls

Tompkins County Dr Leo E Gibson, profess clinical surgery, Syracuse University, College Medicine, will speak on "Infections of the Courmary Tract," on Monday evening, May 1! 8 30 o'clock. The lecture will be given at Tompel and Court May 1. Tompkins County Memorial Hospital, Ithaca

AMERICAN HEART ASSOCIATION

The annual meeting of the American Heart Association will be held at the Hotel President, Atlantic City, New Jersey, on June 6 to 8, 1947, prior to the annual session of the American Medical Association Members of the medical profession and other interested persons may attend the scientific sessions on June 6 and 7

-PROTEIN

MEDICAL NEWS

New Research War Opened on Poliomyelitis

A NEW battle against poliomyelitis (infantile paralysis) and other virus diseases will be waged in the laboratories of the New York Botanical Garden, in the Bronx, where investigators will start a search for an antibiotic capable of destroying or inactivating such viruses

The new research program, announced jointly on April 14 by Basil O'Connor, president of the National Foundation for Infantile Paralysis, and Joseph R Swan, president of the New York Botanical Garden, will be financed over a five-year period with \$225.-000 in March of Dimes funds

The study will be supervised by Dr William J Robbins, director of the garden, who is considered one of the nation's leading authorities on antibiotics

It was also explained that the Botanical Garden investigators do not expect to test any substances against poliomyelitis itself or against other diseases, but will turn over information to others who work where facilities permit animal investigation

Capt Vorwald Heads Research of Trudeau Foundation

APT ARTHUR J VORWALD, Medical Corps, United States Navy retired, and head of the medical sciences division of the Office of Naval Research, has been appointed director of research of the Trudeau Foundation Captain Vorwald succeeds the late Dr Leroy Upson Gardner, world famous authority on silicosis and allied pulmonary diseases His appointment becomes effective July 1

Captain Vorwald joined the staff of the sanatorium in 1932 and was closely associated with Dr Gardner In 1942 he was called to active duty as chief of pathology in the Hospital of the United States Naval Academy at Annapolis In 1944 and 1945 he served as the United States medical attaché in London and later that year was appointed head of the medical sciences division

As director of research, Dr Vorwald will guide the research efforts of the biochemical, the bacteriolog, and the Saranac laboratories

The research program involves study in tubercu losis and respiratory diseases including those due to hazards in industry

Advance Medical Study in U S Open to Chinese Students

FORTY-FIVE of the 125 Chinese doctors, dentists, public health experts, and nurses to whom fellowship awards will be made annually, are presently in this country engaged in advanced studies at leading American universities in 14 states, it was announced recently at United Service to China headquarters, 1790 Broadway, New York City

The fellowship awards were bestowed by the American Bureau for Medical Aid to China, a cooperating agency of United Service to China, as part of a three-year program under which six national medical colleges in various parts of China will receive aid designed to elevate their standard of medical education to that of the best institutions in the United States, the announcement stated

The recipients of the awards are given an opportunity to learn recently developed methods and technics from which they were cut off during the

On their return to China after a year's study they will join the faculties of the six national medical colleges which were selected to receive this assistance

ABMAC's new long-range program has been launched to help supply China's pressing need for more and better-trained medical and public health personnel, the announcement stated, pointing out that China has only about 13,000 qualified doctors for its 450,000,000 population, and should have at least 266,000 if the Chinese people are to have anything approximating adequate medical care

Personalities

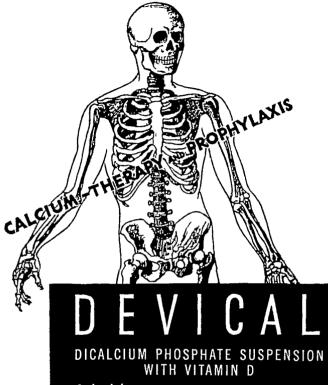

Dr Frank A Calderone of Great Neck, director of the headquarters office of the World Health Organizations, United Nations, is heading a group of specialists from the headquarters office who sailed in March for a meeting of the Interim Commission at Geneva, Switzerland, March 31 to April 15 than 100 leaders in medicine and public health in all parts of the world participated in the Geneva conference

health nurses of Fulton and Montgomery counties in March and related his experiences in World War II, as chief physician in charge of 121 prisoners, including high ranking Nazi leaders at Nuerenberg Families of these prisoners were also guarded during the trial period and were numbered among the His observations of the chardoctor's patients acters of outstanding Nazi personalities included those of Goering, Doenitz, Schacht, Keitel, Ley, and Hımmler *

The County Medical Society held its quarterly meeting on April 18 at the White Swan Hotel in After the business meeting the follow-program was presented "Endocrine ing scientific program was presented Control of Various Functional Disturbances," by

Dr Lyle A Sutton, of Albany, "Vaginal Smear Method of Diagnosis," by Dr Arthur Hengerer, of Albany, and "New Angles in the County Welfare Program," by Lawrence Barsaloux

Westchester County

Dr Frank B Berry addressed the members of the Society at the April meeting held at the New York Hospital-Westchester Division, White Plains Dr Berry, who is assistant professor of clinical surgery, College of Physicians and Surgeons, Columbia University, and visiting surgeon, Bellevuc Hospital, spoke on the subject "Thoracic Surgery of Today"

SALIENT POINTS IN REPORT OF ATOMIC BOMB CASUALTY COMMISSION

A number of interesting facts relating to the Japanese who survived at Hiroshima and Nagasaki were disclosed in the report of the Atomic Bomb (asualty Commission released by the War Department at a recent press conference held in the Office of the Surgeon General

The report carries no spectacular data or stories on freakism or physical anomalies among babies born to persons who were exposed to the bomb It does not deal in the sensational Based upon a study which was relatively short—about six weeks—the report simply gives a direct, unpretentious picture of work which is under way to evaluate the results, upon human beings of a massive dosage of radiation, in combination with the heat and concussion generated by nuclear fission

Following are some highlights of the commission's report, which was reviewed and cleared by the

Atomic Energy Commission prior to issuance "Members of the commission have been impressed during their observations of atomic bomb survivors by the fact that many of the burns have healed with accumulations of large amounts of elevated scar tissue, the so-called keloids," said the report

"The striking feature noted is the large number of burns that have healed with excessive quantities of scar tissue, having a relatively flat surface elevated above that of surrounding skin Margins of these above that of surrounding skin Margins of these lesions are sharply defined. The area involved varies very much, some being as small as one centimeter in diameter while others may involve most of the face or the back. The maximum growth of such tissue evidently was reached about eight to ten months following the injury

"The assay of possible genetic effects is much more readily performed in plant and animal material than in man with, however, the important qualification that in man and, to a lesser extent, plant material, it is often impossible to be certain of position at the time of the bombing," says the report "The Japanese efforts to utilize animal material have been completely nullified by the chaotic conditions and poor food situation

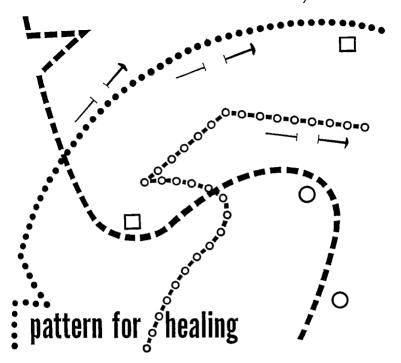

"It is already experimentally proved both in botany and zoology that there is a possibility of producing a malformation of descendants when the sexual cells are affected in some degree by radioactive energy

"The guestion, if this fact is applicable to the human beings or not, will be made clear by further

"In the survey of spermatocytes, it was noticed that they decreased not only in their number but they showed also some structural abnormalities This problem must be, therefore, taken up and carefully followed further

"The problem is one of detecting the changes and recording the events as they occur It is the view of the commission, furthermore, that with the possible exception of genetic recessives (physical monstrosities which might not crop out for several generations), the various changes can be successfully This presupposes, of course, detected and recorded the proper cooperation with the Japanese and a reasonable expenditure of funds"

General, -From the Office of the Surgeon April, Technical Information Division, 1947

Designed for maximum protection and repair of gastric ulcer Malcogel* offers a therapeutic pattern in which

- 1 Immediate and prolonged buffering and adsorbent action fit in with
- 2. demulcent protection of inflamed and eroded mucosa and both combine to heighten
- 3 uninterrupted healing by virtue of continued relief

With Malcogel, there need be little fear of distressing side actions such as constipation, alkalosis, or acid rebound. Mal cogel combines magnesium trisilicate with aluminum hydroxide gel to foster uncomplicated healing—quickly and prolongedly

HOSPITAL NEWS

Cornerstone Laid for Cancer Research Institute

ORNERSTONE of the Sloan-Kettering Institute for Cancer Research was laid April 7 by Alfred P Sloan, Jr, chairman of the board of the institute and donor of the \$2,000,000 building

The institute, a part of Memorial Hospital, New York City, will occupy a sixteen-story structure on the west side of the hospital Occupancy is ex-

pected in the early fall

The ceremony, which was presided over by Reginald G Coombe and attended by 300 persons, followed a brief program in the Memorial Hospital auditorium in which speakers stressed the urgency for research in cancer and the importance of such benefactions as Mr Sloan's in helping make possible such research, but cautioned against assuming that the physical equipment and modern facilities will necessarily produce a magical cure overnight

Speakers were Mr Sloan, Charles F Kettering. vice-president in charge of research, General Motors Corporation, Dr C P Rhoads, director of Memorial Hospital and the Sloan-Kettering Institute, and Mr Coombe, president of Memorial Hospital

Other speakers at the auditorium ceremony included Brig Gen John Reed Kilpatrick, chairman of the management committee of the New York City Cancer Committee, and Dr Lewis 'H Weed, chairman of the division of medical sciences." ences, National Research Council At the cornerstone ceremony the Rev Harry Emerson Fosdick gave the invocation and Francis Cardinal Spellman offered the benediction

New Hospital Plan on Convalescents

UTLINING new concepts of convalescent care to aid patients in more rapid recovery from illness or injury and more continuous medical supervision, the Hospital Council of Greater New York on March 31 recommended additional facilities for general hospitals

In a statement on its master plan recommenda-tions for development of New York facilities, the council said that military and civilian hospital ex-

perience showed favorable results

"Recent developments in convalescent care indicate that medical supervision and active medical programs should continue from acute illness through

convalescence without interruption," the council re-"Under active and continuous medical suported pervision the restorative processes are hastened "

Modern concepts of care include emotional and psychologic, as well as physical readjustment, as a necessary part of the program, the council explained However, development of convalescent services in

all general hospitals will take time, it advises
By 1950, it estimates the following population distribution among the boroughs Manhattion distribution among the boroughs 1,900,000, Bronx, 1,485,000, Brooklyn, 2,000, Queens, 1,638,000, and Richmond, tan, 2.792,000,

185,000

News Notes

An important step toward the construction of a 50- or 75-bed hospital in Mechanicville was taken on March 5 when members of the Hospital Plan-

ning Committee decided to incorporate

Dr Joseph Lebowich, county pathologist, who was the guest speaker at the committee's meeting, told the group that the installation of a 75-bed hospital would be more advisable than a 50-bed one, masmuch as it would not cost any more to operate and would unquestionably bring in more revenue to ne used in the maintenance of such a project. He also stated that should the community raise \$200,000 toward the construction of the hospital, additional aid from the Federal and State Governments would be forthcoming

He also urged that the committee consider the installation of a laboratory which the State would equip without additional expenses *

The only medical library in Rensselaer County has been instituted at Samaritan Hospital, Troy, for the use of every doctor, student, or citizen The library already has been admitted to membership in the Medical Library Association, and thus has an exchange of valuable literature with other medical libraries all over the world

The library is open, with an attendant in charge, for eight hours a day every weekend but is available to any qualified person at any other time Local physicians have been helpful in contributing journals and textbooks so that the medical library is growing steadily *

Having raised \$500,000 of the \$600,000 required by its building program, the Wyckoff Heights Hospital in Queens hopes to break ground this year for its six-story, 150-bed extension on the Stockholm Street side of the present hospital It is expected that the remaining \$100,000 will be raised this year during the continuation of its fundraising campaign

This was disclosed at the annual meeting of the

Hospital society in March
It is expected that a large portion of the new wing will be used for matermity care, for the report showed that 1,055 babies were born in the hospital in 1946, a record of 99 more than in 1945

* Asterisk indicates that item is from a local newspaper

Your Job-And Ours:

To Keep Mothers Smiling

Mothers smile with happiness when you help their babies to grow strong and healthy We're glad to share a little of your respon

shillty by providing Nestlés Evaporated Milk-appreciated by the profession as a help in getting babies off to a fine start in life.

NESTLÉS

NESTLÉ & MILK PRODUCTS, INC.

Nestlé's Has the "Know-How" to Produce a Good Product

- For 75 years, Nestle's milk products have been best known most used for babies round the world
- Nestlé s was the first evaporated milk fortified with 400 USP units of genuine Vitamin D3 per pint
- Nestlé's accepts milk only from carefully inspected herds. As further assurance of quality rigid con trols check Nestlé s Milk every step of the way. We even take the plant apart every day and wash it!

No wonder so many doctors recommend NESTLÉ'S Milk by name

[Continued from page 1166]

Hospital inspectors from the State Department of Social Welfare have cited the Jamaica Hospital in Queens for its commendable efforts in meeting the community health needs, it was revealed recently

by Clarence A Ludium, president
Inspectors of the Social Welfare Department gave the hospital a high rating from the standpoint of its personnel practices, its child guidance clinic, and its Queens Social Hygiene Clinic of the City Department of Health, in addition to its regular hospital services *

When building materials become more abundant, Brooklyn will have a modern, air-conditioned State Hospital replacing the present structure and providing more than four times the bed capacity of the

present institution

The present hospital has a bed capacity of 360 Plans for the new structure provide facilities for The proposed new hospital will be the 1,650 beds first completely air-conditioned hospital in the city Plans and funds for the building have been approved *

St Vincent's Hospital in New York City has purchased a four-story building to be occupied by

The auditorium on the ground floor of the enlarged North Country Community Hospital at Glen Cove, Long Island, will become a memorial to the deceased members of the hospital's medical and surgical staff, through subscriptions being made by present members of the staff, it was announced re-cently by H Irving Pratt, chairman of the hospital's \$1,750,000 building fund

At least \$48,000, the carefully estimated cost of building and equipping the auditorium, is considered assured as the total of the doctors' group subscription In voicing the thanks of the committee to the doctors on the hospital's medical staff, Pratt explained that the total may go considerably beyond this figure The additional amount, he said, will be used to increase the endowment fund *

Dr Louis C Kress, of Buffalo, was guest speaker at a dinner-meeting of staff members of St James Mercy Hospital in the Hotel Sherwood in Hornell on March 11 Dr Raymond Kelly was in charge of the meeting Dr Kress spoke on cancer About twenty members were present

The opening of a "Rh factor" testing laboratory was announced March 19 by the Kew Gardens General Hospital

\$5 charge, and free to those who cannot afford to pay *

B L Lurie, superintendent of Kew General, said the services of the laboratory will be available at a at City Hospital in Binghamton have been submitted to the State Post-War Public Works Plan-

ning Commission

The plans, approved by the Board of Managers of the hospital, call for a new six-story building on Mitchell Avenue, a new third-story addition to Kilmer Memorial Laboratory, and extension of surgical, admitting, and storage facilities *

Dr Edward M Bernecker, commissioner of hospitals, has designated Sea View Hospital on Staten Island as one of five New York City hospitals benefiting from a voluntary civilian blood bank service

Blood will be donated for free use in the city hospitals through American Red Cross blood banks The program was announced in Manhattan by the City's five Red Cross chapters, representatives of the Departments of Health and Hospitals, and the coordinating council of the medical societies of the five boroughs

While the plan calls for just one hospital in each borough to receive the blood at first, it is planned to extend the aid as soon as the number of donors is

sufficient to meet the needs *

The clinical conferences held at Mount Sinai Hospital on April 25 consisted of "Differential Diagnosis of Solitary Nodular Shadows in the Lungs, by Dr C B Rabin, "Factors Influencing Choice of Method of Treatment in Cutaneous Cancer," by Dr W Harris, "Mechanisms of Action of Ionizing Radiation on Biological Material," by Dr B S Wolf, "Pharmacology of the Nitrogen Mustards," by Dr N Kurmek, "Clinical Results with Nitrogen Mustard During 1946–1947," by Dr S Yohalem, and "Nucleoproteins and Cancer," by Dr I Snapper This was the last conference of the season

Establishment of the Joint Committee for Research in the Problems of Cerebral Palsy was announced by its chairman, Dr Phillip D Wilson, surgeon-in-chief of the Hospital for Special Surgery ın New York Cıty The committee was formed to spur medical research and to correlate and intensify the development of diagnostic and treatment pro-Dr Wilson said that his cedure for this condition own hospital, New York Hospital, Bellevue Hospital, Presbyterian Hospital, and the City Health Department were participating in the program, and that deans of three important medical colleges had joined forces to encourage the committee *

Establishment of two blood donor centers to supply banks in five municipal hospitals was announced at a meeting of the New York chapters of American Red Cross and the co-ordinating council of the Five Counties Medical Societies of New York. Donors will receive credit for each pint of blood given and this may be withdrawn from the blood bank if needed by the donor or any member of his family '

commodate the increased requests for treatment at Pawling Sanitarium, has announced the addition of four new beds and plans for a survey of possible new expansion

The increase in the number of beds is required by the long waiting list of patients for treatment at the Pawling Sanitarium, he explained A survey will be undertaken to determine what other expansion can be made in providing more beds for the persons

requiring treatment *

Last year's campaign netted the United Hospital Fund of New York \$1,756,191, a gain of \$99,199 over the previous year, according to a recent announcement

Roy E Larsen, president of Time, Inc, re-elected president of the fund for the sixth term, told the sixty-eighth annual meeting at the fund's head-quarters, 370 Lexington Avenue, New York City, in March that the new campaign, conducted in the interest of eighty-six member voluntary hospitals, showed an increase in public interest in health

He also reported some progress on several studies made to improve hospital services. Mrs Frank Adair, vice-president and general chairman of women's committees, revealed plans for an all-year program for auxiliaries and medical social service

committees *

A survey of county hospitals and recommendations for formation of a county health board and construction of a new hospital at Wellsville and a 25bed addition to the Cuba Hospital have recently been made

Dr Daniel P McMahon, Hornell, district health officer, presented the findings of the survey at a

meeting in Belmont on March 4

The survey recommends construction of a new 100-bed hospital in Wellsville at a cost of \$750,000 and a 25-bed addition to the Cuba hospital, to cost \$187,500 A federal grant would provide \$312,500, a state grant for architectural planning, \$18,750, state aid, \$303,125, and the country would have to raise \$303,125

It also recommends the setting up of a county hospital board with a personnel of workers that would be paid a minimum of \$72,000 annually, when such workers are available, or at salaries get by the Board of Supervisors. The hospital board would be selected by the Board of Supervisors from county board members, county physicians, and residents.*

In an effort to secure additional nursing help, New Rochelle Hospital is inaugurating a program of enlisting a corps of paid nurses aides, Alex E Norton, superintendent, has announced

Mr Norton said the hospital is especially interested in securing the service of those women who worked as aides during the war or on a voluntary basis and may now wish to perform a similar service

for compensation *

The Fillmore Hospital in Fillmore has been assured of State and County aid if the Allegany County Board of Supervisors adopt a plan recommended by the State Health Department

The plan in brief calls for the formation of a County Board of Health consisting of one commissioner, three physicians, and three others, all of whom must be residents of the county. The functions of this board will be to deal with all county health problems. It is mandatory that this board be appointed by the supervisors before county operation of the hospitals can be assumed. With the hospitals operating through this Board of Health, the operating deficit will be shared jointly by the state and county.

Recommendations in the proposed plan called for the erection of a new 100-bed hospital in Wellsville and an expansion program for Cuba to make it a 50-bed hospital Fillmore was not mentioned in the building program, although it was pointed out that it could be a branch of another hospital *

An approximate 33 per cent increase in oxygen service at the Niagara Falls Memorial Hospital during 1946 over that during 1945 was reported by Dr W J Irwin, chief of physical medicine, in his annual statement for 1946

Continued high achievements in the v-ray department were listed by Dr W R Scott, roent-genologist, and the return of twenty-three physicians from military service was listed by Dr Grant Guillemont, as president of the medical staff during 1946, in their yearly reports *

The second regional session of the Council of Rochester Regional Hospitals, Inc., was held March 10 in the Nurses' Home at the Veterans Administration Hospital in Canandaigua

Dr Earl Koos, professor of sociology at the University of Rochester, spoke on "What Society Demands of the Nurse in the Future"*

The need for additional hospital facilities in Nassau and Suffolk counties was discussed at a meeting of officers of voluntary hospitals in the Nassau Hospital Auditorium in Mineola on March 18 Dr John J Bourke, survey director of the postwar public works planning commission, Joint Hospital Board, presented the State-wide program outlined by the

Other speakers were Dr John B Pastore, evecutive director of the Hospital Council of Greater New York, who discussed "Hospital Problems and the Need for Regional Planning," and Dr Philip J Rafle, district health officer, New York State Department of Health, who spoke on "The Relationship Between Hospital Services and Public Health Services"*

A new series of tours of New Rochelle Hospital were begun in March Dr Manville W Norton conducted the visitors through the various departments

Guests were shown the case history room, where records of all hospital patients are maintained, the physiotherapy department, including a view of the therapeutic pool and several new deep therapy machines, the x-ray department where Dr John Fran-

[Continued on page 1172]

IN ITS MOST ADVANTAGEOUS FORM

In Tarbonis, tar therapy finds heretofore unrealized value, not only therapeutically but also for reasons of cosmetic aspect. Compounded by a unique process from specially selected coal tar, the alcoholic tar ex tract in Tarbonis is exceptionally rich in the specific substances to which the action of tar is attributed Tarbonis is greaseless, odorless, colorless, its vanishing cream base, containing lanolin and menthol, disappears after mild inunction. Hence it may be used on exposed skin surfaces without offensive staining of skin, or clothing, and without oily residue.

Tarbonis is specifically indicated in many forms of eczema including the infantile types seborrheic dermatitis, pityriasis, chronic eczematoid dermatitis, varicose and other indolent ulcers, and whenever the action of tar is required

Physicians are levited to send for literature and a sample of Tarbonic.

Tarbonia is available through all pharmacies in 2½ oz., 8 oz., 1 lb, and 6 lb jars.

cis Miller explained the equipment and its operation,

the operating room, and the solarium

The Sunday afternoon tours of the hospital were mangurated in 1944 and are being resumed this year as a part of the program to acquaint the public with the facilities and equipment in use at the hospital *

The Dansville General Hospital will serve as one of the sponsors of the Red Cross Civilian Blood Donor Program, in response to a request from Herbert M Ellinwood, chairman of Clara Barton Chapter No 1

Action to this effect was taken at the Board of Directors meeting on March 11, after it had been explained that similar requests were being made to the Hospital Medical Staff, the Dansville Village-Town Health Board, the director of the Livingston County Laboratory, and the Livingston County Medical Society The American Red Cross policy requires that such a program be undertaken not only with the support of local health agencies but because of their expressed desire *

Children's Hospital in Buffalo may have to close its Cerebral Palsy Chinic if it does not receive financial aid, Mrs John McW Reed, hospital president, has notified Governor Dewey in a recent letter

Because Children's Hospital pioneered in the treatment of cerebral palsy, or birth injury, it should receive a share of any funds appropriated for such a purpose, Mrs Reed asserted She pointed out that the Hospital does not object to the Rochester plan, proposed by the New York State Commission for the Study of Cerebral Palsy, but feels that Children's Hospital also should receive state and *

A special committee to investigate the possibilities of creating a system whereby blood transfusions may be reduced in cost and eventually be free of charge has been formed at Ellis Hospital in Schenectady

has been formed at Ellis Hospital in Schenectady
Dr James E Fish, Hospital director, said the
plan, if found workable, would be made available to
patients at both St Claire's Hospital, when construction of that institution is completed, and at
Ellis A tentative plan would provide that volunteers be listed and called when needed Such a
plan, Dr Fish pointed out, would require cooperation
of Schenectady fraternal, church, civic, and labor
groups in recruiting volunteers

Last year, he said, the hospital gave 1,926 blood transfusions, an average of 5 2 daily In addition, 897 units of plasma were administered Relatives and friends replaced 1,076 of the total transfusions, while professional donors provided the remaining

850

The Cuba Memorial Hospital Auxiliary has released figures showing increased operating costs for the institution and other figures of general interest

In 1939 the operating expenses of the hospital amounted to \$18,000, in 1942, \$29,000, and in 1946,

The number of patients admitted to the hospital is rapidly rising, too, as shown by the following figures. In 1939, the report states, there were 403 adult patients cared for and 58 babies born at the

hospital, in 1942, 723 adults were admitted and 125 babies born there, and in 1946 there were 1,398 adult patients and 225 babies

Of the total number of adult patients treated in 1946, 603 were from Cuba, 304 from Friendship, 69 from Belfast, 58 from Rushford, and the rest from other surrounding towns *

Clinic visits at Beth-El Hospital in Brooklyn totaled 11,166 in the six months ending with February, against 8,430 in the similar 1945–1946 period, it has been announced. The more recent figure, however, remained below the 14,167 in the same six months of 1940–1941, the last similar prewar period Samuel Strausberg, president of the hospital's board of directors, said that the trend now was toward more patients who could not afford private medical care. The hospital is conducting a \$2,500,000 building fund drive.*

A committee to study the possibility of establishing a county health unit and county hospital has been named by Dr John Hollis, president of the Chenango County Medical Society Initial presentation of the idea was made by Dr C W Chapinat a meeting of the medical society held at the Norwich Club

Pointing out that the idea is in an exploratory stage and subject to much investigation, Dr Hollis stated that the preliminary report of the committee

is not anticipated before June or July

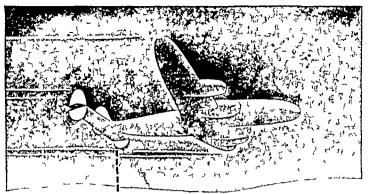

The plan for a county health unit and hospital would embrace the present Chenango Memorial Hospital in Norwich with the addition of a 40-bed unit and a 20- or 30-bed hospital in Greene as a subsidiary unit Under the county unit health plan, state and federal aid would be available for establishing of the county hospital as well as for maintenance The State and Federal and County governments each would pay one third of the costs of establishing the hospital, while deficits in main tenance would be underwritten to the extent that the County would pay one-fourth and the State three-fourths *

The New York Foundling Hospital, New York City, has been sold and a new home for the institution, which has been run at its present site by the Sisters of Charity of Mount St Vincent since 1873, may be made on the old Rhinelander block, on the west side of Seventh Avenue between Twelfth and Thirteenth Streets, as an addition to St Vincent's Hospital This, however, it was said, is not yet in a definitive stage

The New York Foundling Hospital is the receiving station in the city for abandoned and neglected children of all creeds and colors, and during its history is reported to have cared for more than 100,000 children. It had its beginning in a small house at 17 East Twelfth Street, where it was founded by Sister Irene and Sister Teresa Vincent, of the Sisters of Charity, on Oct. 11, 1869

By 1870 the institution had outgrown its facilities and moved to 3 North Washington Square, where it remained until November, 1873, when it was moved

to its present extensive home *

QUICK-DIRECT-EFFECTIVE

And so is FERRO ARSEN For most rapid hemoglobin regeneration and for increased probability of patient's response, Ferro-Arsen for 26 years has been satisfying thousands of physicians.

Ferro-Arsen represents controlled therapy in the management of hypochromic anemia. It places the iron directly in the blood stream where it is required and where it can be quickly effective.

Ten cc ampuls contain as much iron and as much arsenic as do four grains of iron cacodylate.

This may be compared with the one grain in ampuls of iron cacodylate known as Iron and Arsenic. Yet Ferro-Arsen is not irritating and its use has been singularly free from toxicity

Ferro-Arsen is available in 5 cc and 10 cc ampuls.

WOMAN'S AUXILIARY

TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Report of the Woman's Auxiliary to the Medical Society of the State of New York to the American Medical Association

IN THE current year, New York State has stressed organization. Under the direction of the organization chairman, twelve new counties have been added to the New York State Auxiliary, bringing our total to 38 out of a possible 61 A large part of the success of this effort was due to personal contact with the presidents of county medical societies which have no organized auxiliary

A mimeographed pamphlet entitled "Your Questions Answered About a Woman's Auxiliary" has Our constitution does been made available not permit members-at-large, but these new counties have already brought an increase of over 500, which will show in next year's treasurer's report This makes our present membership about 2,500

April of this year saw the publication of the first six-page issue of The Distaff Edited by the press and publicity chairman, it is our first effort to produce a news bulletin. Sent to the homes of our members, it will, we hope, stimulate Auxiliary activity and promote a spirit of friendliness throughout the State A page of Auxiliary news has appeared in the New York State Journal of Medicine A scrapbook of county newspaper clippings and other interesting material has been made up

In public relations, each organized county auxiliary offered its assistance to its local medical society in the work on the National Pediatric Survey mailing list of thousands of homes of prominent, influential people was compiled by the organized auxiliaries for the use of the Public Relations Bureau of the State Medical Society In addition, each county has adopted its own project to fit in with the Medical Society's wishes and its own community needs Work with tumor clinics, eradication of tuberculosis campaign, diphtheria, inoculation, and active participation with other women's groups in the various national health drives Then there has been much accomplished in placing speakers before the public in various health and legislative topics county medical society took over a booth at the local county fair for a display on medical care insurance. Then Auxiliary members, after studying the available material, manned the booth and answered questions on the plan versus socialized medicine as put to them by the public

A program survey conducted by the State chairman showed the auxiliaries interested in a wide variety of topics Programs under four headings were stressed legislation, public relations, educa-tion, and social Carrying on with the project from last year of informing ourselves on voluntary medical care insurance, a total of 15 counties presented a speaker on that subject, and 10 have had the talk

given before lay organizations

The State legislative chairman works under the guidance of the State Medical Society in keeping the auxiliaries posted on pertinent legislation county presidents, chairmen, and members of the legislative committee receive the State Legislative Bulletins, the same as the State Medical Society's legislative committees Nearly all the counties held meetings devoted to legislation, and three counties have had study groups At the request of the State Medical Society, we opposed the chiropractic bill, podiatry bill, and the corporate practice bill by writing and wiring our legislators and registering our opinion with the governor that these bills were detrimental to the public welfare Study of the National 10 Point Health Program of the American Medical Association has been encouraged

In the interest of intelligent Auxiliary leadership. 150 handbooks have been sold throughout the Realizing the importance of the National Bulletin as a means of awaking Auxiliary enthusiasm, we have redoubled our efforts to urge that the officers of each county auxiliary and the members of The result has each executive board subscribe been a rise of over 100 subscriptions since last May

In the *Hyggia* contest, Chautauqua County re-ived honorable mention We have to date over ceived honorable mention

300 subscriptions reported

Our historian has endeavored to give us an overall picture of the activities of the Auxiliary archives chairman has weeded out our files and set them up anew on a businesslike basis to handle an enlarged organization

Our contributions to April 1 to the Physicians' Home amounted to \$539 The State chairman re-

ports donations are still being received

We are presenting several additions to our Constitution, including a provision for district councilors. Inquiries into the duties and value of such officers in other states have made it seem a worthwhile suggestion for revision

At the State convention this year we presented an exhibit showing Auxiliary organization and Auxiliary

activities

In order to foster a firmer bond between the county society and the auxiliary, each auxiliary has been urged to have at least one meeting of the executive board with the advisory board from the Medical Society It was felt that if the doctors understood more clearly how the Auxiliary functioned and where it could be of service, they would use it more often and to better advantage

Through our Advisory Council, Dr James Reuling, chairman, Dr Nathan B Van Etten, and Dr Clement J Handron, the Medical Society of the State of New York appropriated \$1,000 to help promote Auxiliary activity We are more than grateful for the first beauty and the state of the first beauty activity. ful for the further opportunities this money opened We deeply appreciate the close cooperation and complete backing of the State Medical Society

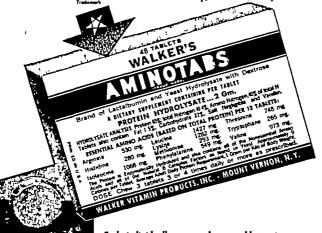

given the Auxiliary in its work This year, each officer, chairman, and county president received a mimeographed booklet on the The theme was outline and plans for the year "Teamwork County Medical Society and County Auxiliary" These books contained the suggested plans for each State chairman for the county presi dent to choose the layout of her year's work eliminated the necessity of letters to the president

provides the <u>modern</u> answer to <u>protein</u> <u>therapy</u>

AMINOTABS (protein hydrolysate tablets)

Each individually wrapped, agreeable tasting tablet provides 2 grams of protein hydrolysate plus natural vitamin B complex. Convenient to carry in purse or pocket for chewing throughout the day [Continued from page 1174]

and kept everything under one cover. A separate copy of each State chairman's proposals was sent directly from the State chairman to the respective county chairman. We also mimeographed copies of our yearly reports of the State Convention. In this way we hope that the incoming county presidents will be assisted in finding ideas and suggestions from these reports. Following a National Auxiliary idea, we invited the county presidents-elect or vice-presidents to attend all State board meetings. They received invaluable stimulus and information from this contact.

The State president attended the National Convention in San Francisco, California, and the National Board meeting in Chicago, and a Pennsylvania State Auxiliary conference in Harrisburg, held private conferences with 25 of 26 county auxiliary presidents in May and June, trekhed 13,000 miles about the State and visited with 26 doctors, presidents of county medical societies without auxiliaries, addressed the doctors' meetings of the eight district branches of the State Medical Society, 24 of 26 organized Auxiliaries, and also 11 of the 12 newly or-

Three meetings were held with the Advisory Council, and a written report made to the Council

each month

Mrs Harry F Pohlmann, president-elect, has been an invaluable help to me in much of this work.

Our Convention charman worked diligently to prepare an interesting, smooth-running Convention. We had the pleasure of having Mrs Jesse D Hamer, our National president, with us at that time In the interest of cultivating a spirit of neighborliness between states, we invited the State Auxiliary presidents of the surrounding states, Connecticut, New Jersey, Pennsylvania, and Ohio

I would like to express my gratitude for the friendly help and suggestions that have come to me from other State presidents

New York State has profited from the advantages of these contacts. Some of my fondest memories of this year are en twined with generous cooperation of these many

State presidents

It has been a great opportunity to have worked with the officers and chairmen of the Woman's Auxiliary to the American Medical Association and to have served New York State as its president. The success we have enjoyed has been the direct result of the splendid cooperation and un tiring work of the State chairmen, county presidents, and individual members.

Respectfully submitted, Mrs Alfred L Madden, President

County News

Queens County The Woman's Auxiliary to the Queens County Medical Society recently celebrated its fourteenth anniversary by having a party and a membership reception, the last in a series of three At the Auxiliary meeting Mrs Helen Metzler spoke on "Current Plays" Mrs Thomas d'Angelo, chairman of legislation, requested all members to send telegrams to their State representatives urging the defeat of the chiropractic bill A vote of thanks was extended to Mrs Michael Schultz, chairman of the membership committee, and her district representatives

A dessert bridge was held by the Auxiliary on May 13 Mrs James De Sane was in charge

At the meeting of the Executive Board on April 1 reports were given and a donation sent to the Red Cross by the Auxiliary

Schenectady County At the April meeting of the Woman's Auxiliary to the Schenectady County Medical Society, Mrs Harry Van Wagenen, State chairman of cancer control, was guest speaker Mrs William Jameson has been named chairman of the cancer control program for the Auxiliary for the coming year

ELEVENTH INTERNATIONAL CONGRESS OF MILITARY MEDICINE AND PHARMACY IN SWITZERLAND, JUNE 2-7

The Eleventh International Congress of Military Medicine and Pharmacy is scheduled to be held in Berne, Switzerland, June 2 to 7, 1947

Berne, Switzerland, June 2 to 7, 1947

The United States will be represented by an official delegation of five or six members to this meeting, including one from the Surgeon General's Office

The International Congress of Military Medicine

and Pharmacy was founded by a group of consulting surgeons with the Allied Armies serving during World War I for the purpose of perpetuating and capitalizing experiences in all matters relating to military medicine, featuring chiefly medicine and surgery, health administration, and the relationship between armies and the social agencies officially accredited to them.

HIGHLY NUTRITIOUS .. YET PALATABLE AND SATISFYING

Dietary supplements in order to ac complish their desired nutritional in fluence, must be tasty and appealing to the palate. Otherwise, refusal by the patient will defeat their very pur pose and will limit nutrient intake.

The food drink made by mixing Ovaltine with milk ranks high in nu trient content and palatability. This dietary supplement provides generous amounts of virtually all essential nutribents including ascorbic acid in readily digestible thoroughly bland form. Its

delicious taste is appealing to all patients young and old who drink it with relish in the recommended quantities—two to three glassful's daily. This amount as can be seen from the table of composition readily complements to adequacy even a poor daily dietary.

This nutritional supplement finds application when nutrient intake must be raised, in sub nutrition after recovery from infectious disease and during chronic debilitating illness

for arterial hyper**TENS/ON**

Teaching patients how to relax is a primary consideration in the management of arterial hypertension. In many instances this is not a simple task, but it can often be made easier by supplementing common sense instructions with Theominal. This slow acting vasodilator sedative helps to bring about a gradual reduction of blood pressure and through its gentle sedative effect reinforces relaxation.

DOSAGE: The customary dose of Theominal is I tablet two or three times daily; when emprovement sets in, the dose may be reduced Each tablet contains theobromine 5 grains and Luminal 1/2 grain.

THEOMINAL

SUPPLIED IN BOTTLES OF 25 100 AND 500 TABLETS

Do "human relations" lie within the physician's sphere?

From earliest times the doctor, like the spiritual adviser, has been the repository of the family's deepest problems. Today many of these can actually be treated with new scientific accuracy and improved medical therapy. For example, the frequent marital and family dislocations brought about by the approaching menopause.

Modern oral Conestron administration can tide most women through this physical adjustment of the menopause with a minimum of physical distress or emotional unbalance, give back a feeling of well-being that restores them to their families and themselves

A new booklet for the physician's distribution "Through One of Life's Progressive Changes" will help patients and their husbands arrive at better understanding of this natural change Copies free to physicians on request

"BG NOT SICK TOO LATE, NOR WELL TOO SOON."

POOR RICHARD'S ALMANAC (1734)

BENJAMIN FRANKLIN (1706-1790)

TODAY, THE DOCTOR SAYS IT THIS WAY:
"If you're not completely well, you're sick."
In nutrition, the value of such an attitude is well established. Today, vitamin deficiencies are properly/recognized as diseases needing prompt and adequate treatment. To most physicians, adequate treatment includes thorough multivitamin therapy To many physicians thorough multivitamin therapy means

"A crage but not esculated 16" N By Microbiomony tot form, 1" Supplement By Chemical Analy is THE NEED FOR a stable preparation of amino acids—one that is stat fresh for venoclysis—has now been satisfied through the production of lyophilized amino acids, sterile, non pyrogenic, dry and dehydrated like blood plasma

This new preparation, rich in 'essential' amino acids, effectively combats negative nitrogen balance, readily soluble, it is compatible with your choice of U S P diluent and can be given as a 10% solution, and the pH is 65

Each bottle contains 60 grams of amino acids, enough to satisfy the average daily nitrogen requirements of the surgical patient.

IT'S NEW!

Thwart these three threats

Sun rashes, poison ivy dermatitis, and insect bites not only are a threat to the summer enjoyment of your patients, but the scratching they provoke may lead to infection and scarring

Control the 1tching with ENZO-CAL

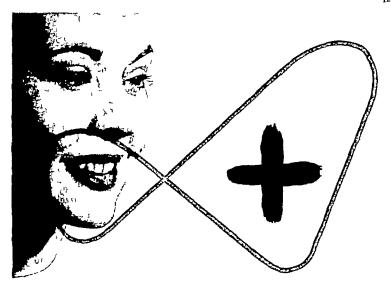

A combination of semi-colloidal calamine and zinc oxide with benzocaine, ENZO-CAL gives *prompt* and *prolonged* relief of pruritus Patients prefer ENZO-CAL because it is a soft, pleasantly fragrant, greaseless cream that is clean and convenient to use and will not stain clothing or bed linen

Available in 2 oz tubes and 1 lb jars at your local pharmacy Sample and literature on request

305 East 45th Street, New York 17, N Y

ENSO-CAL STOPS ITCHING

ORALLY ACTIVE MENOPAUSAL THERAPY... with a plus

Prompt relief of distressing menopousal symptoms may be expected with the use of Premarin administered by mouth Most gratifying to the patient also is the emotional uplift which usually follows treatment and is invariably described as a sense of well being. Therapy with a plus

Premarin provides naturally occurring conjugated estrogens for effective therapy by the oral route with comparative freedom from untoward side effects

Premarin is available as follows

Tablets of 2.5 mg Tablets of 1.25 mg Tablets of 0.625 mg

Tablets of 0.625 mg , Liquid containing 0.625 mg in each 4 cc. (1 teaspoonful)

bottles of 20 and 100 bottles of 20 100 and 1000 bottles of 100 and 1000

fattles of 120 cc.

While sodium estrone suifate is the principal estrogen in Fremarin, other equine estrogens estradiol, equilin, equilentin, hippulin are also present as water-soluble suifates. The water solubility of conjugated estrogens (equine) assures rapid absorption from the gastrointestinal tract

ORALLY ACTIVE MENOPAUSAL THERAPY... with a plus

Prompt relief of distressing menopousal symptoms may be expected with the use of Premarin administered by mouth Most gratifying to the patient also is the emotional uplift which usually follows treatment and is invariably described as a sense of well being. Therapy with a plus

Premarin provides naturally occurring conjugated estrogens for effective therapy by the oral route with comparative freedom from untoward side effects.

Premarin is available as follows:

Tablets of 25 mg Tablets of 125 mg Tablets of 0 625 mg liquid, containing 0 625 mg in each 4 cc 11 teaspoonful)

bottles of 20 and 100 bottles of 20 100 and 1000 bottles of 100 and 1000

bottles of 120 cc.

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estradiol, equilin, equilenin, hippulin are also present as water soluble

sulfates. The water solubility of conjugated estrogens leguinel assures rapid absorbtion from the gastroinfestinal tract

◄ with Mercuhydrin

With the introduction of more effective mercurial diuresis. the xanthine derivatives at last have achieved a more satisfying role in the treatment of cardiac decompensation. In this new role they serve as adjuncts to mercural diureas. In combination with the mercurial, "theophylline enhances the rate and completeness of absorption so that the drug (mercurral) is effective and well tolerated by intramuscular as well as intravenous administration."* Theophylline also increases

glomerular filtration so that the effect of the mercurial in mhibiting tubular reabsorption may provide the greatest water loss. Mercuhydrin combines mercury and theophylline as the sodium salt of methoxyoximercum propylsuccinylurea-theophylline. As well tolerated by muscle as by vein-therefore adapted to modern, sustained dosage schedules m treatment of cardiac decompensation-Mercuhydrin obtains uniform "dry-weight" levels of body fluid-avoids intermittent exhausting bouts of edema

Joe Daily Produced These Levels

100. —

THE curve reproduced above depicts the plasma penicilling blood levels which can be expected from a single 1 cc. in section of Crystalline Penicillin G Potassium in Oil and Wax This curve represents a modified geometric average of plasma penicillin levels produced in a series of 174 patients, 117 of whom were afflicted with pneumonias and 57 with other infec tions. In over 95 per cent of the patients, plasma penicillin levels of 0 03 units per cc or higher were obtained for the entire 24 hour period concentrations considered adequate in the treat ment of virtually all infections in which the Romansky mixture is indicated. It is significant that at the 24th hour level less than 5 per cent of the cases failed to show assayable blood levels Crystalline Penicillin G Potassium in Oil and Wax (CSC) is supplied in 10 cc and 20 cc size vials, each cc containing 300 000 units of Crystalline Penicillin G Potassium (CSC)

Cardictron The First Successful Direct-Writing ELECTROCARDIOGRAPH

The unexcelled performance of the direct-recording Cardiotron—a product of the Electro-Physical Laboratories—reflects more than a decade of experience in manufacturing direct-recording electroencephalographs.

In the Cardiotron the technique of direct electro-recordings are developed to perfection. This instrument produces instantaneous, permanent readings. All photographic procedures are completely eliminated. Thus, the Cardiotron enables cardiographic investigation during surgery as well as in routine office or clinical practice, or even in the patient's home. The Cardiotron weighs only 31 pounds, is vibration-proof and is free of susceptibility to strong interfering electrical fields. You are invited to send for complete details.

Digitaline Nativelle spares the decompensated patient hours and days of needless terrifying air hunger and apprehension. In a matter of hours, instead of days, it effects initial digitalization, and with virtually no locally induced gastric upset.

Its high degree of purification permits oral administration in full digitalizing dosage 12 mg, given at one time or in two equal parts at a 3-hour interval, produces initial digitalization in 6 to 10 hours. Thereafter, maintenance is readily effected by 01 mg to 02 mg daily, depending upon the degree of the patient's physical activity and his individual responsiveness to the drug

The original digitoxin, Digitaline Nativelle represents the chief active cardiotonic

glycoside of *Digitalis purpurea* It is 95 percent pure digitoxin, free from the irritant impurities and dross which cling to the whole leaf Its uniformity of potency is such that dosage is calculated on the basis of weight of drug, making for more uniform therapeutic results

Digitaline Nativelle is specifically indicated in congestive heart failure, auricular flutter, auricular fibrillation. To make sure that your patient will receive the original digitorin, kindly specify Digitaline Nativelle on your prescriptions.

Physicians are invited to send for complimentary copy of the brochure' Management of the Failing Heart, and a clinical test sample of Digitaline Nativelle sufficient to digitalize one patient

HOW SUPPLIED

Digitaline Nativelle is available through all pharmacies in 0.1 mg tablets (pink) and 0.2 mg tablets (white) in bottles of 40 and 250, and in ampules of 0.2 mg (1 cc) and 0.4 mg (2 cc) in packages of 6 ampules and 50 ampules

Poliomyclitis

Poliomyelitis is a widespread, usually mild, general systemic infection which probably belongs to the respiratory group, but which in rather rare instances is complicated by involvement of the central nervous avatem. It is somewhat analogous to measles, but milder and lacking, of course, a rash. Measles is occasionally complicated by encephalitis, poliomyclitis sometimes is complicated by involvement of the motor cells of the central nervous system usual mode of transmission appears to be by droplets, the virus entering the body through the cells of the upper respiratory tract However, poliomyelitis is a general systemic infection in which virus gains access to most body secretions and appears in the feces. Theoretically, any of these secretions, or excreta, might serve to spread the infection Poliomyelitis resembles measles also in its

epidemiologic aspects. It is a "arowd" or "herd" infection and is constantly present in the community Epidemics occur when a sufficient number of susceptible persons have accumulated in the community However, even during epidemic periods most of the infections are indistinguishable, clinically,

from other mild, nondescript illnesses, but these infections, though mild, confer immunity upon the respective subjects.

The reason for involvement of the central nervous system in occasional cases is unknown, but seems to depend upon characteristics which at the time are peculiar to these particular persons. Because of the epidemiologic characteristics, it is obvious that isolation of cases with central nervous system involvement is useless as a means of controlling the spread of the disease.

Poliomyelltus is a virus disease, and primarily an intracellular infection, once the cells have been "invaded," there is no known effective therapy

Care of cases with central nervous system involvement, then, is not a matter of therapy directed against the virus, rather it is a matter of preserving the usefulness of muscle fibers which have not been deprived of nerve supply

Control of the disease falls entirely within the realm of preventive medicine. Vaccination should be of considerable value, once the technical obstacles to the production of a satisfactory vaccine have been overcome.

The Full Circle of the Hospital

We have been reading the Bulletin of the Hospital Council of Greater New York ¹ The March number is devoted to "Care of Convalescent Patients Now Seen as an Important Hospital and Medical Activity" It is so good that we should like to have it read in its entirety by every member of the State Medical Society

It seems to us that it represents a very inspiring rounding out of the full circle of the hospital. The original definition of a hospital was "a friendly place for the reception of guests." Such as the Alpine Hôpital de St. Bernard, we suppose. From such a friendly wayside inn the hospital degenerated into the pest house, the alms house, Bedlam—the waste basket for the reception of such unfortunate human beings as society no longer cared to harbor.

As medicine, psychiatry, and surgery advanced, doctors, always on the prowl for clinical material, give increasing attention to the hospitals as their most readily available stock piles

What curious mixtures combine to produce that hybrid called a doctor! He springs from the humanitarian anxious to relieve human suffering From men like that soft-hearted addlepate Pinel-so his contemporaries regarded him-who knocked the chains from the demented confined in the dungeons of La Salpétriere autopsy hounds like Rokitansky, who, with ghoulish curiosity, only concerned themselves with the demonstrable physical changes that had brought about death, with the pathologic specimens that enabled them to demonstrate the fallibility of the clinician From the clinicians like Laennec and Osler. interested in correlating their observations at the bedside with the final findings in the dead house

Progress went on slowly The hospital became a place for the most scientific treatment of disease Wonders came out of it Medicine and surgery made great strides with the assistance of the human material it provided But how far it wandered from

being a "friendly place for the reception of guests" Its guests became cases As the mania for surgery waxed, cases of acute or chronic appendicitis, of gastric or duodenal ulcer, of gallbladder disease, of hemorrhoids, were hustled into and out of the hospital at breakneck speed

We blush, we toss uneasily at night, thinking of the "chronic appendices" removed from love-sick virgins. Of the gastric ulcers we cured by operation and at the end of three weeks' convalescence bithely sent back to their scolding wives, or their miserably underpaid jobs, or their ever-increasing families. It was not thoughtlessness, it was, as Dr Johnson said, "Ignorance—sheer ignorance"

Then social service slowly and painfully wormed its way into the hospital and, chiefly guided by a discerning and humanitarian man named Richard Cabot, gradually made doctors conscious of factors in the background of a human being that had slowly changed him from an individual to a patient, to a case, to a convalescent

We ask our readers, if they can, to obtain and read the *Bulletin* That is our test. We spoke of the full circle of the hospital We have sketched it very briefly

If we have interpreted the article correctly, the hospital is still a friendly place for the reception of guests, but a place in which its guests should remain for as short a time as possible is there, the patient's friends are interested in finding out as much as they can about the factors in his background that may have made him sick. They get him out We pass of bed as fast as possible over statistics that prove that the sooner a man is on his feet the less liable he is to thrombophlebitis or phlebothromboss. Far more important than statistics is the fact that the place for a man is on his feet

He then goes to a convalescent home, in which he has every variety of treatment, from physiotherapy, occupational therapy, to psychotherapy, which is directed, not to getting him out of the institution, but to

¹ The Bulletin of the Hospital Council of Greater New York, Vol 3, No 3, March 1947

restoring him to normalcy and, much as we hate the phrase, to getting him back on the

What interests us chiefly is the new and ultimate responsibility placed on the shoulders of the doctor. He is no longer the magician called in for a brief moment to wave his magic scalpel over the man momen tarily laid low by a surgical emergency.

From now on he is supposed, and we use the term advisedly, to catch his patient from the moment he shows the first signs of deviation from the normal, and to stay with him until he is not only out of the hospital but back on his job

Hitching our wagon to a star? Frankly, yes. What is man's reach for, but to exceed his grasp?

Justice for Public Employees

Governor Dewey of the State of New York on March 27 signed the Condon-Wadlin bill which outlaws strikes by public employees and fixes dismissal as a penalty for violations. The Governor ments thereby the heartiest thanks and congratulations of the whole people of the State whose interests and safety he has promoted with sincerity and courage

The profession of medicine, charged with the responsibility for maintenance of the public health without regard to the affairs of any minority groups whatsoever, has seen in the recent past the grave threat to the accomplishment of that duty implicit in the alleged right of public employees to strike. Anarchy and constitutional government cannot coexist. Governor Device and the Legislature have lived up to their responsibilities to the whole people of the State.

It is now distinctly up to the whole people to exercise their obligation to the public employees in a just and equitable manner. That is surely implicit in the denial of the right to strike. Public indifference to wage scales adequate to maintain a decent standard of hyms, and, in the case of teachers,

public failure to accord them the right to live and act like human beings is a sour mess of pottage to offer in trade for a strike right Public employees do not cease to be human beings when they become public servants Unrealistic attitudes toward them by the whole people can only produce an inevitable reaction of resentment and inferiority

The number of physicians who have become public servants has increased through the years as public health departments have grown and as more doctors have gone from private practice to an employee status, many entering government service in this capacity Doctors, therefore, will be appreciative of both sides of the story, whether as public servants themselves or as citizens who, being physicians, have renounced voluntarily the right to strike.

It is to be hoped that doctors personally and through their professional organizations will support actively any action to obtain for public employees fair wages, good working conditions, and, above all, recognition as human beings doing an important work for the public interest, safety, and instruction

Common Fear and Universal Survival

The British Medical Journal has published an article under the title, "The Internal Combustion Engine and the Spread of Disease" "There is evidence that in the past few years in Africa yellow fever, cerebroepinal fever, trypanosomiasis, intestinal bilharxiasis, and gonorrhea have all been spread by those who used the roads in

their search for work or trade A few generations ago, few Africans dared to wander from their tribal lands If they did so it was at the risk of death or at least enslavement."

We think that is wonderful Stay at home and mind your own business. Why? Because if you don't, you risk death or en-

slavement The statement is so simple and so true that we know there is not the slightest possibility of the human race abiding by its logic

1228

The prevention of transport by aeroplane of the insect borne diseases, though a comparatively simple problem, is of greater magnitude than at first appears. The measures which are necessary to prevent the spread of insect borne diseases by aeroplanes are, of course, well known, and if they are carried out properly should make the risks infinitesimal. These measures are the sanitary control of (a) aerodromes, (b) aeroplanes, and (c) air passengers, crews, and ground staff.

The organization which dealt with the sanitary control of aerodromes and aeroplanes during the war has now largely been dispersed, but peace has not brought a solution of these problems, which remain as urgent as ever

There can be no doubt that the measures re-

quired can be adequately carried out only by an international organisation 1

But if, as we obviously must, we establish quarantine stations at every international border, the border guards will, and must. fraternize There is, thus, a chance, just a chance, that individual citizens of various countries will find that their opposite numbers are not the unspeakable barbarians that their leaders would like to have them believe We have often thought that fear. rather than sex, is the most common and compelling urge of life Thus, from common fear of disease, we may see the burgeoning of true internationalism It is a practical aspect of the Crusade for One World that appeals to us most strongly

¹ Brit M J No 4486, pp 979-982 (Dec 28) 1946

Current Editorial Comment

New York's Vacation Lands With the oncoming summer, the thought of the doctor turns to plans for rest and relaxation from his work and duties He may enjoy travel and sightseeing but need not necessarily consider going far away from home He has in his own State many and varied opportunities. The lakes, the rivers, the mountains, the beaches of New York can meet his demand

The opportunities are many and varied and are well described and illustrated in an admirable booklet, issued by the Division of State Publicity, which may be had for the asking by addressing 112 State Street, Albany 7, New York Its contents constitute an invitation to make use of the facilities which New York offers to vacationers, for the beauty spots are manifold They must be seen to be appreciated

Nephrectomy for Hypertension with Unilateral Renal Disease Among the many known (or suspected) causes of hypertension are lesions of the kidney. When the lesion is confined to one kidney, and the other organ is normal, the resulting hypertension may in some cases be relieved by nephrectomy. The difficulty lies in determining in advance which cases of unilateral renal disease are most likely to respond favorably to surgical treatment. To select out of the great body of hypertensives, those

few with the offending kidney lesions involves a tremendous amount of work. Every hypertensive patient must be suspected until eliminated by extensive and expensive examinations. The effort is probably worth while, even if the great labors in so large a field yields, numerically, a small harvest

Ratliff et al ¹ report their experience at the University of Michigan Hospital over a period of six years (1940 to 1945), during which they studied 2,055 hypertensives in the urologic clinic. For hypertensive patients, pyelography is routine, and also for those patients receiving the following special examinations: eyeground, electrocardiograph, orthodiagraph, renal function, and (when excretory urograms are not satisfactory) cystoscopy with split phenolsulforphthalein and retrograde pyelogram. In addition to those tests, one authority suggests aortography

Renal abnormalities were found in 183 patients, or in about 9 per cent. Of the 2,055 pyelographic studies completed, 1,350 had no symptoms (except hypertension) or urinary findings to indicate the need of pyelography. With only 9 per cent (183 patients) showing renal abnormalities, less than 5 per cent were considered appropriate for nephrectomy, and still fewer came to

¹ Ratliff, Rigdon K J.A.M A 133 296 (Feb 1) 1947

operation In the period of eleven years (1934 to 1945), 49 patients were treated by nephrectomy The results were as follows

		Per cent
Good	17	34 6
Improved	6	12 2
Failure	26	53 0
	_	
Total	40	

Of the 49 patients treated surgically, 32 had some complaint or abnormality referable to the unnary tract, and 17 had none, as determined by simple clinical examination. The following table shows the results of nephrectomy in the various pathologic groups.

	Num	-	Im- Tai		
	ber	Good	prov	ed w

From the foregoing it will be seen that of 49 hypertensive patients treated by nephrectomy, the results were good in 17, and there was improvement in 6, making a total of favorable results in slightly less than 50 per cent. The figures are faulty, however, in that the 2,055 cases of hypertension were studied during a period of six years (1940 to 1945), while the 49 cases treated by nephrectomy covered a period of eleven years (1934 to 1945) Figured on the number (2,055) of hypertensive patients studied, the favorable results of nephrectomy are only 1 119 per cent, which is indeed a meager The best results were achieved in cases of adult chronic pyelonephritis, hydronephrosis, and calculus pyonephrosis results, however, justify the large amount of work done by the authors, if only to emphasize the magnitude of the problem of separating so few from so many, and to discourage immoderate claims.

Ponce De Leon, 1947 We had recently under our eye an ordinary advertisement from an ordinary daily newspaper It read "Estrogenic Hormone Cream in part This ingenious preparation contains natural estrogenic hormones, the equivalent of a substance abundant in youth, but unfortunately decreasing with the years. These hormones help your over-thirty skin retard the appearance of aging "

The harmonious phrases of the polished advertising writer had a reminiscent ring Why yes, we thought, it's only a change in gender A short time ago we had been reading-and writing-about the same thought applied to the male sex alive, ever-like hope-springing eternal in the human breast Ponce de Leon was no fool At least, in his quest for the fountain

of youth he stumbled over Florida

Four hundred years later males and fe males are embarking on the same quest but the risks they run for the attainment of their ambitions have been whittled down from transatlantic voyages in a wind blown cockleshell to hypodermic injections and

toilet preparations

"Hormone preparations" The phrase brought up vague but simister recollections Charges, law suits, a million dollars Anxious to avoid any such costly blunder we, through our reliable channels of information, called an expert and this is what we were told "It," (the advertised prod uct) "dilates the superficial vessels and increases the avidity of collogens for water, leading to a more youthful appearance of the skin" We were also assured that the quantity of USP hormones contained in the face's daily ration was so small that it could have no constitutional effect

It is interesting, is it not, to reflect upon what the slightest bit of charlatanry will Indeed we are surprised that the majority of the medical profession has been so successful in avoiding it We have been told that the man who put the glands of internal secretion on the therapeutic map marked out a small area on his patient's body in indelible ink He then told his patient to take as much contment as could be spread upon her little fingernail and rub it carefully into the territory outlined. If an infinitesimal portion of the precious stuff were to spill over the border, he would not be answerable for the consequences

It is such meticulous attention to detail that gots results We would venture the statement that there is scarcely a woman in the United States who has not at some time or other spent more than she could afford upon some facial, vanishing, stimulating, cleansing cream, used it more and more carelessly in constantly increasing quantities, and finally thrown the empty jar disgustedly into the waste basket

Here is where our advertiser comes in "Hormones-where have I heard that word before? Something about a million dollar law suit, wasn't there? The stuff must be I'd best be careful with it" dangerous And the lady uses exactly the specified quantity, she rubs in the prescribed way, for the precise time, until her elbows are ready to drop off

But that is only the half of it Her husband enters the boudoir waving the bill from the store "What's this?" says he "Twice as much as you've been paying for

cold cream!"

She explains the situation to him zac remarked that any man who chose to enter his wife's boudoir was either a fool or a philosopher This husband invades it for a sounder reason than either folly or resignation He is a businessman and he wants to be sure that he is getting his money's He sits on the side of the bed watching the very last atom of that expensive goose grease worm its way into the wrinkles of his wife's face and neck cannot observe "the increased avidity of the collogens for water," but he does see "the dilation of the superficial vessels" As he watches he begins to appreciate the drudgery that the little woman through twice a day on his account doesn't grudge a cent that he has spent for this new stuff over the cost of the obsolete cold cream

Not being Balzac we cannot ask you to accompany us further But we would not doubt that the next morning the husband feels that his money has been well spent, that his wife's complexion the next morning is rosy and more youthful, and that his wife reflects simultaneously that it's the first morning in years that George at the breakfast table has looked at her before grabbing for his newspaper

Eye Bank for Sight Restoration, Inc

A little more than a year ago¹ this organization was concerved by Dr R Townley Paton and ably promoted and executed by Mrs Henry Brecking dee, the executive-director of the Eye Bank, both of New York. American Red Cross and the airlines lovally contribute their services without which the plan would collapse So says Dr Derrick Vail in the June, 1946, issue of the American Journal of Ophthalmology The collection and distribution of eyes, the corneas of which are to be used as material for transplant operations, is a major problem in logistics

There is no question of the need for this service. When there is urgent necessity for material with which to perform a transplant, says Dr Vail, all that one needs to do is to get in touch with the Eye Bank and an eye, sterile and preserved, is immediately shipped by an or messenger within a relatively few hours

In the past the surgeon has had to wait until he had a suitable donor lined up, or material from a stillbirth available when needed When the operation was performed by less than a handful of pioneers (who deserve and receive great credit for their contributions) working in very large communities, this problem was not difficult however, more and more ophthalmic surgeons are competent to do this type of surgery, and many more are becoming trained in its meticulous though relatively simple technic

It, therefore, is becoming increasingly unnecessary for patients to travel great distances, at considerable expense, in order to have the operation performed donor's cornea is made available as near to the patient's domicile as possible

Regional branches are needed to complement or augment the work of the National Eye Bank Such a branch has recently been established in Chicago to serve the Midwest

The Branch enjoys the support and the legal backing of the Eye Bank itself and, in return, takes an active part in its

great humanitarian purpose

The Journal heartly endorses the work of the Eye Bank and refers interested readers for more exact and detailed information to the Eye Bank for Sight Restoration, Inc. Hospitals 210 East 64th Street, New York and the members of local ophthalmologic societies are uiged to become affiliated with this movement so that more surgeons can obtain more material to make more blind to

LEO F SIMPSON, M D

The President Elect

Dr Leo F Simpson was born in Rochester, and educated in the parochial schools, graduating from the Rochester Free Academy. In 1905, after graduation from the University of Buffalo School of Medicine, he began his internsh at St. Mary's Hospital where he served for two years, after which he est. I hed his practice in Rochester.

Dr Simpson is president of the medical staff of St Mary's Hospital and chief of the surgical department. He is a consulting surgeon on the staff of the Strong Memorial Hospital of the University of Rochester, and, until recently, was director of surgery at the Monroe County Hospital. He is also a consulting surgeon on the staff of the Park Avenue Hospital.

He is a diplomate of the American Board of Surgery, a Fellow of the American College of Surgeons, and of the International College of Surgeons, as well as a member of the American Medical Association

In 1934 Pope Pius XI made him a knight of the Order of Pope St Sylvester in recognition of his many humanitarian services

Dr Simpson is a past-president of both the Medical Society of the County of Monroe and of the Rochester Academy of Medicine He is a delegate from his County to the State Society

He has served our State Society for many years in many capacities, prominent among which are membership on the Legislative Committee, the Planning Committee for Medical Policies, the Committee on Medical Service and Public Relations, and the Medical Expense Insurance Committee

ELECTRIC CONVULSIVE THERAPY IN GERIATRICS

ALFRED GALLINER M.D., New York City

(From the Department of Neurology Columbia University, College of Physicians and Surgeons and the Neurological Institute)

LECTRIC convulsive therapy for psychotic Conditions during the semium (sixty years and over) is still recommended and carried out on a limited scale. Family physicians, as well as neuropsychiatrists not actively engaged in electric convulsive therapy, are usually hornfied if this form of treatment is recommended for pa tients in the age bracket above 60 The hesitancy to submit patients of advanced age to this form of treatment can be traced to two objections First, the risk which is assumed to be far above average, and second, the belief that psychotic conditions in patients of advanced age are necessarrly the results of cerebral arteriosclerosis or senile dementia. Since these allegedly underly ing conditions are known to be irreversible and progressive by their very nature, a therapeutic approach to the mental condition is deemed to be hopeless and futile These objections are as easily understandable, seemingly only revelations of good common sense, as they are erroneous

Those objectors to electric convulsive therapy for the advanced age group who hase their objections on the high risk can claim also the support of publications of experts in this therapy. These statements, however, were made during the first years of the therapy, while the necessary experi-

ence was not yet available

Impastato and Almansi originally had set an age limit of 40 years which they extended in 1942 to 60 1 One was particularly under the impression that ambulatory (office) treatment was out of question for older patients Increased risk in patients of older age was assumed to be caused by the presence of vascular pathology of corebral as well as of extracerebral site. According to Wartman 200 per cent of men and 80 per cent of women have marked arteriosclerosis by the age of 60 However in 1941 Myerson' had treated cases with heart disease, believing that mental suffering and extreme anxiety were more harmful to the patient's general condition than cleetric convulsive therapy In 1942 Glueck reported on a series of patients ranging in age up to 73 years who had been treated with it.4 In 1943 Evans treated 17 patients over 60 5 of them being over 70 with an average number of 14.9 electrically induced convulsions with remarkably few complications and untoward results. The same author in 1945 described his experience with electric convulsive therapy in 38 cases with known cardiovascular disease. His group included 19 cases with presumptive to positive coronary artery disease. He also treated 5 patients who had auricular fibrillation during the presence of this abnormality also included 9 patients with hypertension with a systolic blood pressure above 200 mm, of mer-Evans concluded that electric convulsive therapy could be given with remarkably little danger, even in cases with serious organic disease of the cardiovascular system. Diabetes pernicious anemia, spastic paralysis, pregnancy. hyperthyroidism, carcinoma, coronary disease. hypertension, cerebral thrombosis all of them seen in association with severe depressions or manic states, were treated with this therapy by Bennett7.s and full recovery without organic com plications took place. Only cardiac decompensation and active pulmonary lesions or systemic infections were considered to be contraindical tions.7.8 Kalinowsky and Hoch have found it unjustified to reject patients for treatment on account of arternal hypertension, when the hyper tension is partly caused by the mental condition They stress the close interrelationship between the mental condition and hypertension, particularly in agitated depressions, and have observed lowering of the pressure as result of improvement of the agitated depression produced by the therapy They also have never seen aggravation of pre-existing heart disease under it.

It is noteworthy that, although it has to be admitted that slight temporary myocardial changes may occur during electric convulsive therapy, probably due to apnea which accompanies the seizure no permanent electrocardiographic changes are caused by it. Foster kennedy treated elderly patients up to the age of 80 successfully. It describes cases of acro-

tated depression accompanied by very high blood pressure. The latter seemed to be part of a hypothalamic storm and disappeared temporarily after successful electric convulsive therapy

It can be assumed, however, that occasionally arterial hypertension may become aggravated by it and that myocardial insufficiency even may lead to a fatal outcome ¹¹ Nevertheless, fatalities altogether are an exceedingly rare occurrence in this therapy. The few ones which have been reported ¹²⁻¹⁷ do not allow definite conclusions, although it has to be conceded that the majority seemed to be of cardiovascular origin ⁹

The argument that mental conditions above the age of 60 are not accessible to treatment due to their underlying pathology also cannot be Careful investigations 18 19 have maintained proved that there is no real correlation between the pathologic changes found in senile brains and semile dementia Patients with advanced semile dementia have been demonstrated to show few plaques and vice versa. Severe cerebral changes of the type of arteriosclerosis and senile dementia have been found in the brains of mentally healthy persons 20 Metabolic and toxic factors²¹⁻²⁴ have been held responsible for a considerable percentage of psychotic conditions during the semium. They are not necessarily Neurotic conditions also irreversible if treated have been proved to be responsible for many of the difficulties of later life Their dynamics do not principally differ from neurotic conditions in younger persons,26 and among them we find the neurotic depressions which form the group of psychoneuroses best approachable by electric convulsive therapy 26 There is no reason to assume that manic-depressive equivalents should not occur during the senium 27

With these factors in mind, it is not surprising that good or excellent results from the use of this therapy in the older age group have been reported recently. Kalinowsky and Hoch⁹ treated successfully a woman patient, 76 years old. Bennett's^{7 8} oldest successfully treated patient was 83 Kino and Thorpe²⁸ found the recovery rate in the senile group higher than in the involutional and presentle patients and Mayer-Gross²⁹ found recovery and improvement in treated patients above sixty in 80 per cent. Palmer reported good results in patients above 65, who were suffering from manic-depressive and so-called late involutional depressions.

Notwithstanding these favorable experiences, the majority of physicians continue to be opposed to application of electric convulsive therapy during the semium. A recently published study dealing with its therapeutic efficacy shows that among 100 treated patients, there was only 1

above 70 years and only 7 between the age of 60 and 70 31. Another recently published survey, analyzing three years of electric convulsive therapy administered to 276 patients in a state hospital, does not mention any patients in the semile age bracket 12-14. Among 116 consecutively treated private patients, this author has treated 18 patients of the age of 60 or above

In Table 1 (See pages 1234 and 1235) patients rated as completely recovered are those who have stayed well for at least eighteen months and have shown no sign of relapse during that time They have returned to their routine mode of life and activities

Laboratory studies, like x-ray studies, electroencephalograms or electrocardiograms were not done as a routine procedure, but only if there was definite clinical evidence of organic path-Cardiologic consultation was asked for only exceptionally, since it was felt that the responsibility should not be shifted to a specialist not acquainted with the particular details of electric convulsive therapy 32,33 The indication was made only when the risk connected with a continuation of the psychotic situation seemed to be severe and greater than the risk of a possible aggravation of the pre-existing organic condition In no case was it recommmended or given before more conservative methods—sedatives, vitamins, dexedrine, psychotherapy—had been tried and had failed

Only patients with well-cooperating families were accepted for treatment. It goes without saying that good cooperation by members of patient's family, particularly in an ambulatory case, is even more necessary in electric convulsive therapy than in other forms of psychiatric treatment.

An important part in the relation between the physician and patient's family is that relatives should be prepared for the undesired but unavoidable sequelae of this form of therapy, the immediate postconvulsive confusion and the organic reactions, particularly memory defects and "blurring" 19 22 33 The relatives have to be taught to differentiate between the original psychosis and the organic sequelae, and have to be prepared for their appearance beforehand

If the treated psychiatric disorder was of recurrent nature, the number of the present episode has been mentioned under the heading "Psychiatric Pathology" in Table 1—In all other cases the disorder had occurred for the first time in life—The technic used did not differ materially from that described in numerous articles by Kalinowsky, and his coworkers, and recently summarized by Kalinowsky and Hoch. A Rahm machine was used

Our experience shows that age per se never

constitutes a contraindication to electric convul sive therapy. Our oldest successfully treated ratient was 84 years old (Case 3). Arterial hypertension also does not constitute a contrain dication. The highest blood pressure observed in a treated patient prior to treatment was 240/ 140 (Case 11). None of our patients was in a state of cardiac decomponsation, and such a patient would not have been treated. However, in most of the patients there was ample evidence of generalized arteriosclerosis, as well as of myocardial damage, retinal, and cerebral arteriosclerosis, electroencephalographic changes attributable to corebral arteriosclerosis were noted

The age or the presence of cardiovascular pathology did not require any material change in the technic The majority of the patients were treated in the office on the table but hospitalized patients were treated in their beds. Hyperex tension of the back with the pillow placed on the level of the midthoracic spine, was used uni formly in all cases Many of the patients, at least at the beginning of the treatment, were on sedatives, particularly barbiturates, and we did not have the impression that this resulted in a considerable raising of the threshold In accord ance with the findings of Kalinowsky and Hoch! we found the average threshold in our aged women patients to be high We have not seen any con siderable raising of the threshold in the course of the treatment. Also in accordance with Kalınowaky's experiences, we have made it a strict rule to avoid subconvulsive dosages and responses

Occasionally, sedatives were given in order to allay the fear of the treatment. Although in younger natients we have occasionally resorted to administration of electric convulsive therapy in pentothal sleep (sleep electroshock therapy), 24-12 we have never found this necessary in the old-age bracket Curarisation prior to treatment, in our opinion should never be used as a routine procedure. It may be used if a special indication is present. One patient (Case 12) suf fered a compression fracture of the fifth dorsal vertebra at the first treatment, and although her pains apparently were not too severe, treatment was continued with intravenous administration of curare. In view of the ranty of bone injuries and their usually harmless character in the rare instances when they occur it is hard to under stand why in many places curare still continues to be used as a routine procedure *1.1.1.14 How ever, it seems to be justified to use it in patients who previously have suffered fractures. We have not observed that administration of the treatment in an ambulatory manner was in any way inferior to treatment in the hospital.

The handling of the old patient during the shock did not differ in any way from the technic used with younger patients. Only mild restraint was applied during the attack. The lower jaw always was kept firmly in place. Artificial respiration was used as a routine procedure, as recommended by Kalinowsky and Hoch ! Shaking of the head, using the gag still clenched between the jaws of the patient as a handle, was also used as a routine procedure and seemed to be a more powerful stimulant than artificial respiration No postconvulsive apnea of disturbing degree was seen in our elderly patients Those patients in whom the apnea at the first treatment seemed to last longer than desirable were given coramine prior to the subsequent treatments, we have the impression that this resulted in a shortening of the appear period

The postconvulsive confusion, even in patients of advanced age and with some mental deterioration, did not seem to last materially longer than in younger patients, although we have the impression that older patients are more inclined to sleep after the therapy than younger patients

However, the ambulatory patients without exception were able and fit to leave the office an hour or an hour and a half after administration of the shock. The frequently observed postconvulsive complaints (headaches. nausea) were not more, possibly even less, frequent and marked than in younger age groups The impairment of memory and other organic reactions like intellectual "blurring," 12,22 usually becoming noticeable after repeated convul sions, did not seem to be more marked, but seemed to occur earlier than in the average younger pa tient As in younger patients we have used the appearance of marked memory defects and blurring as the indication to lengthen the intervals between treatments

Whereas patients are started usually on three treatments per week, the frequency should be reduced to two or one per week with the appearance of marked memory defects. As Table 1 shows, the average number of treatments was low, lower than in younger patients No hard and fast rules as to the number of treatments can be established. According to Foster Kennedy. 10 \$ patients should be treated until they get well Improvement usually occurs earlier than in younger patients. Keen judgment, has to be used in order to decide when the moment has arrived to stop treatment. Occasionally the affective disorder for which the patient is treated is obscured by the "blurring" sideeffect of the treatment We, therefore, sometimes do not know whether the emotional

disturbance already has really disappeared, or is only cloaked by blurring. If the blurring side-effect is not marked, we apply the same guiding principle which is used in younger patients, i.e., to give two or three treatments usually with longer intervals, after recovery has taken place. On the other hand, particularly in ambulatory patients, memory defects and blurring may force an early termination. Different principles have to be applied in maintenance therapy. These will be discussed later.

Except for simple encouragement, no psychotherapy whatsoever was applied once the therapy had been instituted. The favorable results, therefore, have to be attributed solely to electric convulsive therapy.

As seen in younger patients, the psychiatric improvement was accompanied or preceded by increase in weight and chiefly and most noticeably by improvement in sleep. We can confirm the above quoted observation that in cases where pre-existent arterial hypertension has been aggravated by the affective disorder, a considerable lowering of the blood pressure is noticed simultaneously with the lessening of agitatio tension, although there is usually a temporary (about 10-15 mm Hg) increase of the blood pressure immediately after administration of electric convulsive therapy Under the heading "Complications" in the table we have mentioned one suicide (Case 4) In this case institutionalization had been advised but rejected by the patient and his family One treatment was given at the office, but it was felt that on account of the seriousness of the patient's mental and physical condition, treatment should be continued in the hospital Unfortunately, no room was available and the suicide occurred while the patient was waiting to be admitted It may be assumed that if treatments could have been continued, this regrettable event would have been avoided

The other two cases (Cases 9 and 12), in which no favorable results whatsoever were achieved, were characterized by coexistence of a paranoid picture with the depression. In one of them (Case 12) there were vivid hallucinations. In the other (Case 9) features of dementia were discernible in addition to agitated depression and paranoid symptoms. In this case treatment was discontinued at the request of the patient's family at an early stage.

The complication noted in Case 12 was of a skeletal nature and most unusual in type. The patient, a 64-year-old woman who was suffering from a severe arteriosclerotic Parkinson syndrome in addition to an agitated depression with paranoid features, also had marked osteoarthritic joint changes. After an electric-shock treatment,

she complained of severe pains in her right knee and x-ray studies showed that a large spur was broken off at the upper posterior margin of the patella and lodged in the quadriceps tendon This unusual complication caused the patient considerable pain for about two weeks, but cleared up without any treatment or after-effects

Case Reports

We will now discuss a few cases in greater detail in order to elaborate on the essential points of electric convulsive therapy in geniatrics

Case 5 -The patient was a 72-year-old, white, married woman who had started to suffer from manic-depressive depressions at the age of 18 or 20, and who was now in her twenty-first depressive Her daughter also was a manic-depressive, One sister committed as was her deceased brother suicide during a depressive attack The depressive episodes in the past usually lasted for eight months to one year, and occasionally longer On examination, the patient presented a typical picture of a severe depression with marked feelings of guilt and On physical exa moderate degree of agitation amination there was arterial hypertension pressure was 190/100 There was electrocardiographic evidence of myocardial damage, and there was a systolic aortic murmur There was typical generalized arteriosclerosis. The patient received A grand mal response six treatments altogether was produced each time with a current of 100 volts for 3/10 of a second She started to improve after the third treatment, was virtually well after the fourth, and treatment was terminated after the sixth when she recovered completely from her depression Since she did not show a considerable degree of confusion, and since there was good cooperation on the part of her family, treatments, administered in an ambulatory manner, were given in The entire period comparatively short intervals of treatment did not comprise more than seventeen

This patient has been suffering all her life from typical manic-depressive episodes. The present episode could be terminated immediately with electric convulsive therapy, notwithstanding the patient's age of 72, and her marked cardiovascular pathology. A recurrence in due course, of course, has to be expected. The senium had nothing to do with the patient's condition. Her depressive episodes have been identical ever since they started at the age of 18 or 20. The important point which we want to stress is that the senium and its concomitant vascular changes did not constitute a contraindication to application of electric convulsive therapy.

Case 10 —This 64-year-old, white, married woman presented on physical examination the picture of an arterioclserotic Parkinson syndrome with masking of the facial expression, coarse tremors, pill-rolling movements, rigidity, loss of associated movements, adiadockocinesis, and shuffling gait This condition had started three years prior to examination

Two months prior to examination she had developed the psychiatric picture which she presented when seen for the first time agitated depression with marked anxiety, anorexia, and fear of suffoca tion. The patient paced the floor restlessly for hours constantly repeating 'I cannot I cannot" She expressed fear that her breathing would stop or already had stopped. She felt that her case was utterly hopeless and that she would die in a short time. The nationt was placed on dexedrine rabellon and phenobarbital, without noticeable affect on her mental and moderate effect on her neurologic condi-About one month after her first examination she was committed to a state hospital where her condition remained unchanged. The idea of electric convulsive therapy was rejected by her attend ing physician in the hospital After a stay of ten months at the state hospital she was, at our request transferred to the Neurological Institute for this Her psychiatric and neurologic picture at the time of her transfer was identical with what she had shown at the time of her first examination. She received altogether eight electric-shock treatments. A good convulsive response was produced with 180 volts for 3/10 of a second The eight treatments were given within a period of eighteen days. The depression already had virtually disappeared after the fifth treatment. On the patients discharge her psychiatric condition had cleared up completely, and she was only complaining of pains in her knee due to the above-mentioned large ar thritic spur which had been broken off the upper posterior margin of the patella and lodged in the quadriceps tendon. The patient was able to be duscharged to her home and did not have to return to the state hospital. She now has been uninterruptedly well for a period of sixteen months. She is living with her family and, notwithstanding her nourologic condition, has resumed her routine household duties, including cooking for a large family

In this case an agitated depression had occurred for the first time at the age of 64 in a woman, who in the form of a Parkinson syndrome of recent origin presented evidence of carabral arteriosclerosis. One could have assumed that the depression which remained completely unchanged for thirteen months, was caused by the same arteriosclerotic process and therefore unapproachable by therapy. The psy chiatric condition had been extremely severe and had required institutionalization. The apparently permanent cure achieved by electric convulsive therapy proves clearly that the treatment was not only justified but indicated, and also sheds doubt on the artenosclerotic origin of the depression the condition would have been solely the result of arteriosclerotic brain changes, it could not have been reversed by this therapy It still may be assumed that the undoubtedly present cerebral arteriosoleroals may have acted as a precipitating factor in the production of a nevertheless reversible psychosis. We probably do not fail in assuming that long or life-long institutionalization was avoided in this case by electric convulsive therapy, and that the ten months of institutionalization could have been avoided if treatment would have been instituted immediately

Case 14 - This 68-year-old, widowed, white woman became depressed and paranole six months prior to institution of treatment. She was seclusive, and although in comfortable circumstances she was afraid of poverty was under the impression that she would be imprisoned, and refused to eat, believing that her food had been poisoned. She believed that her relatives and her lawyer were stealing her money She drank water only when she could pour it into her glass in order to avoid being poisoned by the There was marked nocturnal restlesness Her physical condition was good and she showed only mild generalized arteriosclerosis. She received ten treatments. Convulsive response was produced with 150 volts and 1/10 of a second This first treatment episode (in the hospital) extended over twenty three days She made a complete recovery and at the time of her discharge, showed only moderate memory difficulties. The psychosus had disappeared completely

The patient relapsed after exactly two months presenting the identical picture and a second series of treatments was instituted sixty nine days after termination of the first series. This time the treatment was given at the office. Only four treatments were given since it had been decided to terminate the treatment immediately with the disappearance of the psychotic symptoms, because it was felt that not more than a maintenance affect could be expected.

The four treatments were given within two weeks and she stayed well again for two months, when again she relapsed and recovered after another series of four ambulatory treatments given within two weeks. After this third series ahe stayed well for four months when again she devoloped the same depressive paranoid syndrome. Again four treatments were administered at the office, resulting in the disappearanoe of her psychotic symptoms and resumption of her normal mode of high. It has to be expected that this cycle of relapse treatment and temporary recovery will continue for the patient a lifetime.

Novertheless it is hard to underestimate the six missionee and value of maintenance treatment in a case of this type. I = 11-11 This patient, if subjected to treatment each time her depressive para noid psychosis makes its appearance, has been and will be able to continue to live in her home and even take care of her own affairs during the remissions. Without treatment, life-long institutionalization would have been unavoidable. It also should be considered that the great amount of anguish and suffering connected with a psychosis of this type. would have continued whereas with treatment it can be reduced to very short episodes. In the light of experiences of this type, it is hard to understand why occasionally the value of maintenance treat ment is still questioned. Undoubtedly this form of treatment deserves a prominent place in geriatric psychiatry, and should result in avoidance of in stitutionalization in many cases of the type described.

Comment

If it once has been established that in a particular case a complete or more or less permanent recovery cannot be expected, we feel that treatment should be stopped as soon as temporary recovery has been achieved, since usually by a longer course of treatment the remission is not In place of giving a higher number lengthened of treatments in one series, a new series, or at least one or two treatments, will be given when the patient shows signs of relapse words, treatment should be started and discontinued with the appearance and disappearance It is noteworthy that with this of symptoms type of treatment in Case 14, not only the depressive but also the paranoid symptoms, which usually do not have as good a prognosis as the effective symptoms, could be controlled theless, in old patients as in younger patients, the purely affective disorders constitute the main indication for electric convulsive therapy seems to be feasible to differentiate the following four types of disorders in which this form of treatment is indicated during the senium

- 1 Manic-depressive Episodes —These episodes are found in patients who had been suffering from them prior to the onset of the senium and in whom they continue to recur during the senium. These patients, as far as their prognosis in regard to electric convulsive therapy is concerned, do not differ from manic-depressives of younger age. Their prognosis for termination of the present episode is excellent. Just as in younger patients, the termination of the present episode does not protect them from a recurrence at a later date.
- Simple or Agitated Depressions-These start for the first time during the senium, usually with a fairly acute onset Our oldest patient (84 years) had developed a severe depressive picture after a gynecologic operation In cases of this type, which are usually diagnosed as psychosis with arteriosclerosis or senile depression, it has to be assumed that arteriosclerotic and semile changes play a role in the etiology. but are not the exclusive cause of the psychiatric Otherwise their response to the therapy could not be understood since this form of treatment certainly can have no effect on semile or arteriosclerotic changes presence of marked neurologic pathology due to cerebral arteriosclerosis does not seem to exclude the possibility of permanent cures (Cases 10 These cases serve only to underline the mysterious character of the dynamics of electric convulsive therapy and furthermore may raise the question as to the nature of these psychoses, which in the past most authors considered were

directly etiologically connected with organic brain pathology of arteriosclerotic or senile type (This problem will be taken up in a separate paper)

3 Neurotic Depressions—These are fundamentally not different from those seen in younger patients, although their psychologic dynamics and content may be determined by the problems of old age. As in younger patients, it can be assumed that their prognosis depends on the proportion between affective and neurotic elements, with the preponderance of neurotic factors point-

ing toward a poorer prognosis

4 Mixed Paranoid Depressive States—These are accessible to treatment, but their prognosis is considerably worse than that of purely affective disorders—Besides the mixed depressive paranoid states, paranoid patients without pure simple depression, but with agitation, fall into this category—In this group maintenance treatment will have to be resorted to quite frequently. It is our impression that those patients whose premorbid personality contained paranoid trends have a much poorer prognosis than those in whom paranoid features appeared for the first time during the senium

It is obvious that the large group of patients with a symptomatology manifesting itself chiefly in the intellectual sphere (simple mental deterioration) cannot be improved by electric convulsive therapy, except for making them more easily manageable on a chronic ward.

In the four groups of cases outlined above, electric convulsive therapy certainly deserves a trial, notwithstanding the presence of the usual changes accompanying old age, such as hypertensive cardiovascular disease, generalized and cerebral arteriosclerosis, diabetes, and arthritis As stated above, the therapist will have to evaluate carefully the risks of the treatment on one hand, and the risk of the continuation of the psychosis on the other. In many of them, satisfactory results, including avoidance of permanent institutionalization, may be expected.

Summary

Evidence has been presented that electric convulsive therapy is advisable during the senium chiefly in affective mental disorders, notwithstanding the presence of those organic changes usually associated with old age. The different types of disorders approachable by this therapy have been discussed. The importance of maintenance treatment has been stressed.

Nore After completion of this article a paper by Feldman Susselman Lipits, and Barrera appeared in the Archives of Neurology and Psychiatry, Vol. 56, August, 1946 pp 158-170 dealing with the same subject and coming to similar conclusions

WHAT DOES THE MEDICAL SOCIETY OF THE STATE OF NEW YORK DO FOR ITS MEMBERS?

The Business Office

The centralized offices of the Society are maintained at 292 Madison Avenue New York City of 40 persons has been found necessary for the purpose of filing all information about the Society's member ship of affording quarters for the various bureaus dealing with Workmen s Compensation, voluntary insurance plans editional and business office of the Journat, public relations bureau, and a variety of other activities, including a headquarters and meeting place for the Council and Board of Trustees. The present quarters are considerably overcrowded, and when the opportunity offers, changes are contemplated to provide for the constantly expanding work of the Society which is now the largest organization of its kind to provide for the constanting expansion cannot be accomplished without an increasing income contributions from dues sufficient for a period twenty years ago are no longer adequate for the purposes of today. The Medical Society of the State of New York must maintain its position as a description in protrance is acknowledged It cannot function unless adequately supported by its membership

AMINOPHYLLINE WITH A BARBITURATE AS A RECTAL SUPPOSITORY IN THE TREATMENT OF ASTHMA

HERBERT L FRANKLIN, M D, New York City

(From the Division of Allergy, Lebanon Hospital)

THE benefits obtained from the use of aminophylline by means of rectal instillations has not been sufficiently stressed. Numerous papers have been published heretofore on the use of aminophylline in cardiovascular and respiratory diseases. Its clinical efficacy is no longer in doubt

The purpose of this paper is to emphasize the value of aminophylline, when combined with a sedative and administered in suppository form, in the treatment of asthmatic bronchitis

Aminophylline is a xanthine derivative, namely, theophylline, to which has been added ethylenediamine, the addition of which produces a compound more soluble than any other combination of theo-Ethylenediamine does not, in any phylline way, contribute to the antispasmodic effect of aminophylline The beneficial effect of aminophylline, however, is attributed to the fact that it acts directly on the muscle as an antispasmodic, thus relaxing the spastically contracted muscles of the bronchi, with subsequent dilatation of the bronchial tree and the resultant expectoration of the trapped tenacious sputum It is believed to stimulate both the heart and the kidneys by its dilating effect on the coronary arteries and by increasing capillary permeability, thus promoting diuresis

The experience gained with the use of this drug on patients, both at the Lebanon Hospital Allergy Clinics (adult and pediatric) and privately, demonstrates that the rectal route affords rehef, in those who respond to aminophylline, almost equally as fast as the intravenous route We have used aminophylline, plain, over a period of years and have found it to be efficacious both as a rectal suppository and as a retention enema

We decided to combine it with a barbiturate of rapid action to see whether the patients' irritability and apprehensiveness could be assuaged more that way than with aminophylline alone A full strength suppository was used for an adult (0.5 Gm of aminophylline, 0.1 Gm of sodium pentobarbital, and 0.06 Gm of benzocaine) and a suppository of half this strength for children During the year we observed 65 adult cases, ranging in age from 18 to 70 and 15 pediatric cases ranging in age from $2^{1}/_{2}$ to 13 years

The results of aminophylline with a sedative as a suppository in our adult cases showed the following effects 69 per cent indicated moderate to marked relief, 31 per cent evidenced none or very little relief, more effective results were obtained with children, 94 per cent (14 out of 15) indicated moderate to marked relief Our asthmatics were all of the infectious type

The adults, benefited by the use of suppositories, obtained no relief from oral or intramuscular aminophylline Twenty-five of the 65 adults were given plain aminophylline and also aminophylline with a sedative added These suppositories were administered to the patients without their knowledge of the contents The degree of clinical relief obtained without a sedative in these cases was the same. although not as prolonged We felt that the addition of a sedative contributed to a more complete relaxation by allaying apprehension and thus promoting a longer duration of action The fact that patients' reports are frequently subjective and prone to some inaccuracies was also taken into account

It should be emphasized that many of these patients were old, chronic asthmatics with marked changes in the lung fields and thorax, such as are found in emphysema, atelectasis, pulmonary fibrosis, bronchiectasis, and cardiac hypertrophy. These patients would not respond as readily to medication as a person with asthma of short duration. The duration of asthma varied in these adult cases from one to thirty years.

It is worthy of note that many patients develop a tolerance to aminophylline following its pro-It is generally accepted that an inlonged use dividual will develop a tolerance to any drug, particularly when used in excess, as was done by many of our patients who had been using this drug daily over a period of months individuals we discontinued the use of the suppositories for awhile and other supportive therapy was substituted in the interim. In no instance was any sensitivity noted in this group (adult or children) to the barbiturate or cocoa butter base The chief complaint of many patients following a prolonged use of aminophylline suppositories was a feeling of weakness and lassitude secondary complaints were occasional diarrhea, These, however, rectal irritation, and nausea were not troublesome and medication was rarely discontinued for any period of time because of The availability of this these symptoms method to ambulatory, home, and hospital patients

outweighs the minor disadvantages The method of treatment has the added advantage of self application, particularly when a physician is not available, or for some other circumstance.

The results with children were so uniformly ratisfactory that not much discussion will be devoted to it In general, experience discloses that the relief obtained in younger patients is greater than in older nationts regardless of the type of We felt that in these series of observations, asthma was not present long enough nor was it severe enough to cause marked changes in the bronchi and lung tissue. In addition there was the decided advantage of administration by this method The difficulties of forcing a child to take medication whether orally, intramuseu larly, or intravenously, was avoided Relief was obtained by the child from ten to twenty five minutes after insertion This resulted in com plete relief for the entire night, and, in most in stances there was a complete subsidence of the attack for several days thereafter

Because of the desage of barbiturate the suppository was given only at night (half strength) unless the attack was severe. In such instances it was given as often as necessary regardless of the time. No history of rectal irritation was noted and in only two instances was nausea reported following its use. The latter condition resulted in a case of a marked attack of asthma when two suppositories were used within a period

of any hours

Summary and Conclusions

1 These suppositories containing a sedative gave relief in 69 per cent of our adult cases and in 94 per cent of our children. The discrepancy in results obtained with children and adults was probably due to the fact that many of our adult asthmatics were chronic cases with pre-existing pathologic changes, thus presenting a definite handicap to complete control of symptoms.

2. Thirty-one per cent of our cases did not respond to aminophylline at all. We know from experience that aminophylline does not give relief in all asthmatics and that the percentage of nonrelief in ordinary cases is approximately 20

to 30 per cent.

3 Tolerance was developed in those cases using suppositories continuously over a period of

tune (approximately 20 per cent of the adult patients). This is understandable since a toll erance will develop to any drug, particularly if used in excess. We confined its use to those who were doing poorly on other medications and strived to avoid its use over a prolonged period. Therefore, we did not attempt its use as a means of prophylaxis, we used it only as a therapeutic measure.

- 4 In several instances, approximately 10 per cent of our adult patients, suppositories were discontinued because of weakness and occasional rectal irritation, nausea (gastric irritation) and diarrhea.
- 5 Suppositories were particularly effective in epinephrine-fast cases and in general, in those cases which did not respond to routine medication and hyposensitization treatment. In other words, moderate to marked asthmatic cases were treated.
- 6 Ease of administration as compared to the intravenous and intramuscular route recommends its use. It can be employed repeatedly by the patient since termination of the bronchial spasm is almost as complete as by intravenous use Relief is usually obtained in from ten to twenty five minutes after insertion for adults as well as for children. The effect may not be as prompt due to less uniformity of absorption by the rectum, but side-effects are rarely encountered and a definite feeling of reassurance is given the asthmatic.

It is recommended that the suppository be inserted above the anal sphincter prefarably with vaseline or other lubricant. A low enema (one to two glasses of plain tap water) should be given before inserting the suppository in order to clear the rectum, thus adding absorption

toxidant for vitamins and fats.—Food and Nutrition, April, 1947

PHYSICAL MEDICINE IN THE TREATMENT OF ARTHRITIS*

HARRY KESSLER, MD, New York City

(From the Veterans Administration Hospital, Bronx)

THAS become clear, in the light of experience, L that in the treatment of a patient with arthritis we cannot successfully treat the arthritis per se, but we must rather treat the patient as an Keeping this in mind, we should entire entity be keenly aware of the possibilities of physicomedical measures However, while the application of heat or massage or exercise to an arthritic joint may be based on irrefutable logic, unless we recognize the need for consideration of all possible factors in the cause of the arthritis, which might themselves require prophylactic or therapeutic measures, unless we recognize the need for consideration of other forms of therapy including symptomatic and supportive therapy. dietary care, chemotherapy, vaccines, orthopedic appliances, psychotherapy, radiotherapy, and surgery, and, finally in accordance with our more recent experience, unless we recognize the need for consideration of occupational therapy and indicated vocational rehabilitation, our problems in dealing with the arthritic may not be readily It might also be added that we should as readily recognize when, by virtue of certain factors in the disease process or in the patient's general condition, the application of heat or massage or exercise must be cautiously administered or, perhaps, judiciously avoided

Although many classifications of arthritis are to be found in the literature, the simple division of rheumatic diseases into three groups as generally accepted and as described by Kovacs1 is considered adequate from the standpoint of

pathology and treatment

Rheumatic fever, in which physical therapy

as such plays little role

Chronic joint changes a osteoarthritis or hypertrophic arthritis, b rheumatoid arthritis or atrophic arthritis, and c special forms of arthritis, including gouty, gonorrheal, traumatic, and tuberculous forms

Nonarticular rheumatism, including myalgia, fibrositis, bursitis, and certain forms of

neuntis

Kovacs1 further notes a practical system of grading arthritis as described by Taylor and based on clinical and radiologic findings

Based on a paper read before the Eastern Section of the American Congress of Physical Medicine at Walter Reed Hospital, Washington, D C on April 13, 1946

* Published with permission of the Chief Medical Director, Department of Medicine and Surgery, Veterans Administration, who assumes no responsibility for the opinions expressed or conclusions drawn by the author

would appear to be of value from a therapeutic and prognostic standpoint

- Mild or first degree arthritis— aside from soft tissue swelling there are only slight radio-These cases offer the best graphic findings prognosis
- 2 Moderate or second degree arthritisdefinite radiologic changes and localized limitstion of movement, however, patients are usually able to be up and about, and take care of them-Prognosis in these cases is fairly hopeselves ful under adequate treatment
- Severe or third degree arthritis— severe clinical and radiologic changes, patients in this class may walk about for short distances, but they are usually chair or bed cases and are dependent on others for care Prognosis is serious in these cases
- Extreme or fourth degree arthritis-patients are completely incapacitated and bedndden, the prognosis is poor

In the field of physical therapy there are many modalities available for the arthritic The choice of the modality or modalities employed in the individual case must ultimately be determined by the desired and anticipated effect of the pre-By and large the great mascribed therapy jority of physical therapeutic procedures in common usage have, in recent years, emerged from the realm of empiricism which enveloped so much of the work of the not-so-far-distant Today, as a result of research and study by competent observers, we can anticipate certain definite physiologic effects of most of the procedures employed and, we have only, therefore, to determine the physiologic reaction indicated in the specific case and then to choose the modality which will most closely give us the desired effect

The application of heat to an arthritic joint is an almost universally accepted form of therapy Aside from the acutely traumatized joint where local hypothermy may be desirable for a prehmmary twenty-four to forty-eight hour period,2 and aside from the tuberculous joint where heat per se may be understrable, one of our most important methods of attempting to control the symptomatic manifestations, as well as the pathologic processes of arthritis, is by the ap-Its effects are known to be an plication of heat improvement in circulation, an increase in metabolic processes, and a more efficient disposal of the waste products of metabolism

For the more superficial method of applying local heat, it is felt that experience has demon strated the superior value of the luminous type of heat generator * Aside from its simplicity of application, it has been shown experimentally that the near infrared rave which predominate in this form of heat penetrate the skin somewhat more deeply than do the far infrared rays of the nonluminous type of heat generator ' It would appear, therefore, that the former represents a more efficient means of heat application to be noted that in using any reflector type of heat generator situated some distance from the area to be treated, provision should be made for a shield to extend from the generator to the part under treatment in order to avoid undue dissipation of heat by air currents. The duration of the individual treatment should be at least thirty minutes in most cases, since it has been determined that it requires that length of time to produce the maximal heating effect *

Histamines and mecholy! iontophoresis has been used and widely acclaimed by many observers. Although some have felt that simple forms of heat therapy are preferable because in their experience they have found that this form of therapy requires considerable care in administration, that it involves the use of expensive medication, and that the beneficial effects last not more than from four to eight hours this method of therapy undoubtedly has considerable value in certain selected cases.

The paraffin bath for chronic arthritis of the hands or of the feet has proved itself of value in many instances. In affections of more proximal joints the paraffin has been applied by means of a brush and is frequently kept in position for several hours by wrapping a towel about the part.

The use of hydrotherapy in the treatment of arthritis has undergone many refinements in its mode of application and has, thereby become a most valuable asset in our armamentarium of Moist heat physical therapeutic measures locally or warm tub baths are still favorite forms of therapy for many arthritics.3 The whirlpool or hydromassage tank, whether it be the smaller unit for arm or leg use, or whether it be the large Hubbard tank for more general application has contributed a great deal to the well being of the arthritic patient. The contrast bath has also been found of value and frequently will accomplish more satisfactors results than heat alone The technic as practiced at the Mayo Clime ad vocates a ten minute immermon in hot water at a temperature of 104 F to 110 Γ followed by a

one to two minute immersion in cold water at a temperature of 60 F to 65 F, then a repeated cycle of four minutes in hot water and one to two minutes in cold water continuing for twenty to thirty minutes and ending with the immersion in hot water.

The Scotch douche, particularly following a general heat treatment in the electric cabinet, has in many instances relieved pain and relaxed muscle spasm about multiple painful joints. Because of the more general heating effect of the electric cabinet, due consideration must be given to the patient's general condition before exposing him to this form of therapy.

For the production of heat in the deeper tissues, there appears to be little doubt that the experimental evidence at hand, as well as the experience of observers, points to the high frequency electromagnetic induction field as the most effective form of deep therapy. Inasmuch as the sole effect to be anticipated from this form of therapy is that of heat production and since, experimentally, it has been shown that electromagnetic induction causes maximal heat production in vascular tissues, it if follows that this is the method of choice wherever deep heat is in dicated

In this connection certain points in the technic of administration are worthy of consideration. It has been advocated that the application of this form of therapy should be made to the tissues adjacent to the pathologic process as well as to the process itself 12 It further has been advocated that a low intensity dosage should be employed 12 which may, therefore, permit its administration for a longer period of time and at more frequent intervals in order to prolong and maintain the heating effect for optimizing results.

Fever therapy in selected cases of chronic arthritis particularly during acute exacerbations of chronic rheumatoid arthritis, has been ad ministered with favorable results in many cases In one form of accepted technic, the tempera ture of the patient is mised to about 101 F for thirty minutes,13 thereby permitting the repeti tion of the treatment daily or every other day This is in contradistinction to the method preferred by some, whereby the patient's temperature is brought up to about 104 F for a period of several hours 14 Certainly it would appear that with commensurate results the lower temperature and shorter exposure should be less exhausting for the patient and, thereby, widen its scope of application While in the past hyperthermy was almost specific in the treatment of gonococcal arthritis the advent of modern chemotherapy has in many instances climinated the need for

In discussing the application of heat, by whatever form, it should be emphasized that the success of the treatment will depend in part upon the adequate retention of the heat administered The rapid dissipation of heat from unprotected areas can do much to nullify any anticipated beneficial effect of the treatment, and therefore, it behooves us to instruct the patient or his ittendants in the matter of proper protective

to such chemotherapy in resistant cases 16

The application of massage in the treatment of arthritis poses a very delicate problem the definite indications of this form of therapy are clearly understood, and unless its method of idministration is carefully studied, more harm than good may accompany its employment cannot be forgotten that we are dealing with an already traumatized joint. In the more acute joints, therefore, and also, it might be added, in tuberculous arthritis, massage should be scrupulously avoided 16 In the subacute forms of arthritis, the administration of massage should be directed to the areas above and below the involved joint rather than over the joint itself The effects to be sought are the improvement of circulation about the joint, the diminution of edema, and the relaxation of muscle spasm Only in the more chronic types of arthritis may we attempt to apply massage to the joint itself and, then, only with the understanding that we do not further traumatize the tissues

massage properly administered to adjacent areas

will do much to restore the tone of surrounding

musculature which has been weakened in the

course of an acute arthritic episode It is an ex-

cellent practice to precede any application of

massage by thermotherapy of one form or an-

mit the subsequent massage to effect, in a much

certain instances, it has been found that general

as well as local massage2 has done much for the

comfort of the arthritic by permitting greater

muscular relaxation, thereby assisting in the

greater degree, improvement in circulation

The vasodilatation of the heat will per-

greater effectiveness of subsequent therapy The problem of exercise in the treatment of the arthritic is a very serious one, for in its proper employment we may often hold the determination of future deformities and ankyloses It is, at times, difficult to ascertain, particularly in the acute arthritic, wherein the program of exercise so necessary to prevent deformity and ankylosis may be intelligently blended with the program of rest which is equally essential in the treatment of the patient As in the case of other forms of

physical therapy, the intensity of the exercise

ease—the more acute the arthritis the less stren-The type of arthrits mut nous the exercise also come into consideration, for fear of ankyless in the case of rheumatoid arthritis may cause is grave concern, whereas, in the case of osteoarthr. tis we may not be quite so fearful since ankylose is not so frequent in the latter disability " In the very acute phases of arthritis, we may have to satisfy ourselves with muscle-setting

program will depend upon the phase of the dis-

exercises in which actual joint motion may be negligible Yet, even here, an attempt should be made, provided it is not accompanied by too much pain, to gently move the joint through the full range of motion once or twice daily It is to be emphasized that any activity of the tomi should be slow and purposeful at all time. jerking movements or purposeless wiggling an to be carefully avoided Later, mild assisted active exercises may be attempted, still later. more strenuous program of active exercises may be instituted, including postural exercises and underwater activities While a certain amount of pain will frequently accompany active or passive exercise procedures, when such pain persists beyond several hours it is an indication that the motion has been too forceful and

that subsequent procedures should be diminished

certain cases may progress to ankylosis in spile

of any and all procedures, it is extremely essential

that during ill phases of the disease the position

of every involved joint be maintained, by splint

ing if necessary, in an optimum position so that

accordingly

Considering the possibility that

if ankylosis does occur it will cause a minimum of interference with other bodily functions The use of ultraviolet irradiation has a definite place in the therapy of tuberculous arthritis While the mercury vapor lamp may be used, there are many observers who prefer the carbon are lamp with its added infrared ray component Ultraviolet irradiation may also be used for its

general tonic effect in many chronic arthritics, particularly following long sieges of debilitating illness The problem of treating over long penods of time arthritic patients who reside long distances

from available physical therapeutic facilities may, at times, be partially met by a carefully outlined and intelligently executed home program of therapy supplemented by medical checkup as indicated in the individual case in a series of cases reported from the Mayo Chang this program of therapy, while not to be consider ered as a substitute for the fully professionally supervised program, was found to serve an en

cellent purpose in many such individuals and

would otherwise have had to forego the partial

研印 ÆΝ i odic benefit obtainable from the limited facilities at their disposal. The importance of faithful ad becence to an adequate program of therapy cannot be overemphasized

June 1, 1947]

The treatment of arthritic patients at some of our medically supervised spas 21 may satisfactorily serve the needs of many selected patients. Chronic osteoarthmtis lends itself particularly to this program of treatment by virtue of the nature of the disease, but other chronic arthritides may also respond favorably to a course of carefully prescribed treatment while removed from their home environment In considering this form of therapy we must intelligently recognize its limitations as well as its advantages, for only in this manner shall we avoid the error of referring patients who are unsuited for treatment under the conditions prevailing in such health resorts 22

Although the possibilities of occupational therapy as an integral part of the program in the treatment of various disabilities particularly in association with physical therapy have been probed for many years, the general recognition by the medical profession of its true value did not develop until fairly recently It has finally been accorded its rightful place as part of the ever broadening field of physical medicine and, pf as such, it is prepared to play an important role in the psycluc as well as in the physical treatment of the patient. Intelligently applied in the case of the arthritic, it will serve to stimulate his in terest in matters removed from the level of his immediate illness and bolster his morale during I the trying days of prolonged convalescent peof riods. With the guidance of the physician and the ingenuity of the occupational therapist, the proper choice and careful application of suitable projects have proved themselves capable of im proving joint function, shortening convalescence. and conditioning the patient for a much earlier return to physical and economic self-dependence. Beginning with short periods while the patient is still bedfast, perhaps for no longer than ten minutes at the onset the program should be gradually increased as strength and tolerance permit

While the actual projects will depend upon the disease process and the interests of the patient it should be cautioned that one must avoid any activity which requires maintaining d the affected joints in a fixed position " Wherever possible the patient's vocational interest should be considered in the procedures employed

Often a siege of arthritis has, because of the resultant disability left a patient unable to return to his former occupation. As early as posreliable in the course of the disease the vocational possibilities should therefore be surveyed so that, of indicated, adequate measures may be insti

tuted to modify or, if need be, to alter completely the vocational objective previously pursued In this manner, physical therapy, occupational therapy, and vocational rehabilitation may be coordinated in one broad program directed not only to the patient's recovery from his immediate illness but, also, to his reinstatement as a self dependent member of society

Summary

Modern physicomedical measures have much to offer to the arthritic nations if properly chosen carefully applied and if judiciously correlated with other phases of medicine from a prophylac tic as well as from a therapeutic standpoint.

Some of the problems of treating arthritis by physical medicine are discussed in the considera tion of physical therapy, occupational therapy and vocational rehabilitation, as well as in the coordination of these activities in a broad program of treatment. Careful research and in telligent observation have served to secure recog intion by organized medicine of the great value of physical medicine based on a more physiologic approach in the choice and application of its methods Such continued research and observa tion must, in effect, bring ever closer the solution of the many problems in the treatment of arthri

THE GASTRITIS-ULCER SYNDROME AND ITS TREATMENT

Monroe Bradford Kunstler, M D , New York City

HAT gastritis is a constant accompaniment L of peptic ulcer has long been assumed it precedes the ulcer by many years is, in all likelihood, also true It has recently been possible to analyze carefully several cases of peptic ulcer from this standpoint, and in all a painstaking history has at least suggested the presence of gastric disease long before the actual development In one such case, ulcer was first demonstrated by x-ray only two years ago, although symptoms had persisted for at least seventeen years and x-rays during this time failed to reveal Many of these preulcer patients any ulceration with a similar train of symptoms are seen, and, usually, because of a lack of positive findings, are not treated at all or, at best, are classed as having gastric neuroses One wonders whether physicians may not be somewhat remiss in their efforts at ulcer prevention by so disregarding these cases

There is sufficient proof that all peptic ulcers have chronic gastritis as their basis, and it behooves us, if we are to prevent or treat ulcer properly, to keep this concept of ulcer pathogenesis ever in mind Collins' claims that peptic ulcer as a lesion of the gastric or duodenal mucosa is not a distinct entity, but only the most obvious manifestation of chronic gastritis, and shows microscopic preparations to prove this He also states that symptoms of peptic ulcer may be present in the absence of a demonstrable lesion and can be explained only on the basis of a chronic gastritis Hebbel² shows that an antral gastritis was present in all of 98 stomachs resected for ulcer, and he states that an antral gastritis precedes and is the anatomic basis for the development of ulcer Evidence such as this cannot be set aside, and its recognition will alter definitely any preconceived therapeutic concept we may have had

To diagnose properly the gastritis there are three means at our command, namely, x-ray, cytologic studies of gastric contents, and gastroscopic examinations. The latter, while efficient in a certain percentage of cases, requires expert training and cannot, therefore, have as wide an applicability as have the other two, but nevertheless should be made as often as feasible. A wider use of the gastroscope will lead in time to better interpretation and a more frequent diagnosis. X-ray too, while most reliable in the diagnosis of ulcer, is still in the pathfinder stage as far as gastritis is concerned, but, with the develop-

ment of mucosal studies and other modern tech nics, it is becoming more and more efficient, and the roentgenologist, therefore, plays an ever increasing important role in the proper translation of x-ray findings He is more often suggesting the presence of gastritis than was heretofore the By far the most important and reliable means of diagnosis lies in a proper cytologic examination of the gastric contents. This is performed most effectively on the fasting specimen and either stained or unstained smears may be used, the former being much more accurate. Thus Kapp and Stanberger, 3 using stained smears, have found an excess of superficial epithelial cells and leukocytes in acute gastritis and hyper plastic epithelium, as well as lymphocytes and eosinophils in the chronic cases Percentage counts of the leukocytes have revealed an excess in all cases where gastritis was present. West phal and Weselmann' state that the normal cell count of gastric juice is 500 per cu mm with 10 to 40 per cent leukocytes, and that in gastntis the count rises to from 1,000 to 8,000 with 40 to 80 per Mulrooney, m a similar study cent leukocytes using stained smears, believes the method to be of definite diagnostic value and makes possible the evaluation of the response of the stomach to Thus, it would seem that therapeutic measures careful cytologic examinations of gastric con tents are a most reliable means of diagnosis, and, therefore, should be included in all ulcer and preulcer gastric studies

This concept of ulcer, based as it is on the principle that gastritis is the fundamental path ology, influences treatment so distinctly that it hardly seems possible to effect a permanent cure unless it be given first place in planning a regimen for these patients. All of the long-accepted and well-tried means in ulcer therapy are valuable and should, with certain restrictions, be used, but with the addition of aluminum hydroride lavages, which will be described later, a greater and more direct action on the gastrits is attained and the chance of cure immeasurably enhanced

Diet and medication have been for so long a part of any ulcer regimen that little need be said regarding them. Yet the present tendency toward dietetic liberalization makes the prolonged milk diets seem rather superfluous, and an early return to a full diet is warranted with only those dietary restrictions which have proved harmful As to medication, alkali has been its mainstay,

but if attention be focused on the gastritis rather than on the acid, it loses its import in ulcer therapenals and, therefore should be restricted aluminum hydroxide gels, owing to their astrin gent action, have a definite effect on the gastric mucosa, and properly may be used, although when given by mouth so little of the medication comes in direct contact with the mucosa that much of their benefit is obviated Antispasmodics by their action on smooth muscle alter changes in rhythm and spasm markedly and are the medica tion of choice

The belladonna group, or better still, the synthetics such as syntropan may be used and should be given in large enough dosage to exert their full effect.

Gastric layage with solutions of aluminum hydroxide, which I first described eight years ago, has been my chief therapoutic measure in the treatment of this gastritis-ulcer syndrome often to the exclusion of all other medication My concept of ulcer, based as it is on an under lying gastritis, indicates the need for treatment of the entire gastric mucosa and in aluminum hydroxide, because of its astringent action and acid-absorbing quality, we have an ideally ef ficient remedy for this purpose. Its use by lavage, if properly applied assures distribution over the entire gastric surface and the spill over into the duodenum undoubtedly affects this area also It has been my custom to use lavage always through a Levin tube and in a strength of two ounces of aluminum hydroxide gel to two quarts of water

At the outset, treatment is applied once or twice daily preferably in the empty stomach and, as improvement takes place, it is gradually reduced in frequency, until eventually only rare applications are made The response to therapy is judged by frequent cytologic examinations

and an eventual return to normal cytology indicates the need for no further treatment together with x ray studies, is the final criterion of cure

The response to this type of therapy is immediate and the reduction of pain and gastric distress as well as a sense of well being, and particu larly an increased appetite, are noted and appreciated by patients. As treatment progresses the period of relief resulting from each layage is prolonged until eventually the patient remains completely symptom free

In conclusion, it may be stated that from all evidence it appears that peptic ulcer is always accompanied by a chronic gastritis which precedes the ulcer by many years and is, in fact, the anatomic basis for its development Greatest reliance for its diagnosis is placed on cytologic examinations of the gastrio juice and v ray stud ies the latter by reason of refined technics becoming more and more valuable. For the amelioration of symptoms the well recognized forms of treatment are of value, but in order to enhance the possibility of permanent cure the basic pathology must be treated directly I have found to be most efficiently carried out by gastric lavage with aluminum hydroride gel solu tions Final judgment as to betterment or cure is made only when cytology returns to normal and x ray studies indicate it

THE PRESENCE OF ATYPICAL LYMPHOCYTES IN RESPIRATORY DISEASES*

Sholom O Waife, M D, Brooklyn, New York**

(From the Department of Medicine of the Long Island College of Medicine)

THE presence of numerous atypical (monocytoid) lymphocytes in the blood is a characteristic and pathognomonic feature of infectious mononucleosis ¹ However, it is less well known that these cells may be found in other clinical A number of reports have stressed this states fact from time to time

Atypical lymphocytes were noted by Baldrich et al 2 as being found in patients without infectious mononucleosis, but with pyogenic infec-They concluded that "the tions and adenitis occurrence of absolute or relative lymphocytosis with abnormal lymphoid cells in the blood was significant only of acute lymphoid hyperplasia" Josephs^a reported on an epidemic of "influenza" with a glandular fever-like blood picture, and concluded that neither the clinical picture nor characteristic mononuclear cells are peculiar to infectious mononucleosis. A similar mild epidemic of pyrexia, malaise, with occasional cervical adenitis, and with abnormal lymphocytes in the blood recently has been described by McFarlan and McFarlane 4 Warren⁵ noted a number of cases of upper respiratory infections, acute pharyngitis and sinusitis, with from 1 per cent to 10 per cent atypical lymphocytes in the peripheral There are other reports of a similar nature, 67 and in all of these, heterophil agglutination tests were negative Stuart et al, 8 in a report of similar cases, suggest that the atypical lymphocytosis may be an unusual reaction to an upper respiratory infection caused by any of a number of organisms Atypical lymphocytosis was also found in a group of patients with various allergres,9 and with atypical pneumonia 10 Thus, abnormal lymphocytes in the blood may be found in a variety of clinical states

During the winter of 1945–1946 a group of patients with various upper respiratory tract infections were found to show lymphocytes of the type clearly described by Downey 11 12 A total of 32 cases were studied and 125 blood smears Twenty-seven of the 32 were under 40 years of age, the youngest was 15, the oldest Some contracted their respiratory infection while on medical wards for unrelated diseases.

while other cases included hospital personnel ambulatory or hospitalized

The above-mentioned group of patients had varying degrees of coryza, pharyngitis, tracheolaryngo-bronchitis, cough, expectoration, malaise, aches, pains, lassitude, and headache But there was no characteristic clinical picture. Some patients were afebrile, while others had a temperature as high as 104 6 F All cases showed cervical lymphadenopathy to some degree, but this was never particularly extensive or marked One patient had an enlarged spleen and pleural effusion Five patients had undoubted atypical virus pneumonia, with x-ray evidence of pneumonic infiltration, 3 of these 5 had a cold agglutinin titer of 1 32 or higher Most of the infections ran a short, acute course, but in a few cases the infection persisted for weeks and only gradually subsided

No etiologic agent was discovered, however, Throat culand no virus studies were made tures revealed the usual mouth flora, hemolytic streptococci being found in significant amounts in only 2 patients Penicillin had no noticeable And lastly, no posieffect on the clinical course tive heterophil agglutination test was found

Atypical lymphocytes (Downey types I and II) were found in all cases They ranged up to 48 per cent of the differential count large lymphocytes were also present in every case, but small mature lymphocytes were infre-There was a great variation in the quently seen morphology, size, and shape of the lymphocytes The total white cell count in any one smear was only occasionally elevated, so that there usually was a relative and absolute neutropenia Eosmophilia when present was minimal Red blood cell counts and hemoglobin determinations No relation was were all within normal limits found between the severity of the infection or the day of the disease and the blood picture examinations and blood chemistry studies were normal

A table of 17 unselected illustrative cases is presented (See Table 1)

During the same period several typical cases of infectious mononucleosis with adenopathy and positive heterophil agglutination tests were on the wards, as were cases of virus pneumonia with-

(a) = Highest recorded rectal temperature

out atypical lymphocytosis but with cold agglu tining over 1 32 titer

The similarity in some respects of this respira tory epidemic to infectious mononucleous and to the influenza and virus pneumonia group suggests a peculiar hematopoietic reaction to unrelated Viruses This supports the suggestion of Stuart et al

Summary

A group of 32 cases of respiratory tract in fections (coryza pharyngitis, bronchitis, and virus pneumonia) showed the presence of atypical lymphocytes in the blood Heterophil agglu tination tests were negative. This confirms other reports that the infectious mononucleosis blood picture is not specific for that disease and may be found in a variety of mild respiratory infections The mechanism of this cellular reaction to presumably unrelated infections needs further elucidation

PISTACHIO IS BETTER

A woman phoned to say that her young son had a severe abdominal pain in the lower right side The doctor prescribed an ice bag and said he d visit the patient shortly Half an hour later, the mother called again. The child was vomiting violently When the doctor asked what he had eaten since the previous call, she said, "I ou prescribed cold to the abdomen. I thought it would be better to work it from the inside I gave him a quart of vanilla ice cream —Medical Economics, April 1947

THE GYNECIC FACTOR IN THE CAUSATION OF MALE IMPOTENCE

A L WOLBARST, MD, New York City

IT IS not generally recognized that ovulation in the female is but one of two major factors in nature's plan for reproduction and the perpetuation of the species. The other factor is fertilization of the ovum by sperm which, nature has decreed, shall be deposited in the vagina by copulation. The latter, in the male, involves what we term "sexual potency." We thus see that male potency and female ovulation are in reality complementary phenomena, both essential parts in nature's system and in all probability subject to similar laws.

It has not been many years since male impotence was regarded as an exclusively urogenital pathologic process and treated as such today it is still regarded and treated as such by The verumontanum and the prostate bore the brunt of the therapeutic attack on genital organs with results that could not be called satisfactory Within recent years, however, attention has been directed to the fact that psychic repression usually is associated with neurologic inhibition and that this sequence usually is responsible for the failure of male potency, often, perhaps, as a focal dysfunction induced by diseased urogenital organs The inhibition resulting from this sequence is manifested in what we term "impotence" To deal with this condition intelligently, the urologist should know something of psychology and the psychologist something of urology

Any interference with the physiologic movement of nerve impulses from the brain and nervous system to the genital zone may and usually does induce a psychologic block, resulting in some form of sexual dysfunction, usually (in the male) in some degree of impotence. In this field we are dealing with a highly sensitive physiologic mechanism of a most complicated character, in which psychic, physiologic, and somatic elements are closely related. But there is still no explanation of the fact that in one man the psychic and somatic factors combine to induce premature ejaculation with no impairment of erection, while in another with the same factors the erectile power alone is affected.

It is a curious but not generally recognized fact that the physician cannot and does not make the diagnosis of impotence. The patient brings the diagnosis with him. There are no medical tests for impotence. We can test a man for his sight, his hearing, his digestive powers, his fertility, and even his mental powers, but we cannot test his sexual powers.

take the patient's word for it, and here is where we often make a serious error In the case of a married man who reports himself impotent with his wife, it is common practice to assume without further investigation that the man is totally impotent, that is, impotent with all women must ask and answer the question, 'Is the man totally impotent or only relatively so?" This is the real criterion for impotence. Not infrequently, the principal complaint of the patient is that he finds himself impotent with his wife but normally potent with other women information is of the greatest diagnostic importance, for it limits the impotence to the wife and makes certain the diagnosis of relative impotence based on some psychic disturbance

In these cases, it does not seem either logical or scientific to brand the man as impotent, when the dysfunction is only related to one woman, the wife. It is my considered belief that in our usual disregard of the significance of this situation, we can find the reason for the generally unsatisfactory state of our therapy for male impotence.

The most common type of impotence encountered in practice is that of the middle-aged married man. In a series of 100 consecutive cases over a period of several years, 79 among my patients belonged to this group. The age of the patients ranged from 41 to 68 years, grouped as follows.

41 to 50 years, 35 cases

51 to 60 years, 28 cases

61 to 68 years, 16 cases

A review of the histories of these cases reveals that the impotence was found relative to the wife alone in 49 cases. In other words, relative impotence was observed in 62 per cent of 79 married men who believed themselves totally impotent. Of these relative cases, the age groups were as follows.

41 to 50 years, 24 cases

51 to 60 years, 18 cases

61 to 68 years, 7 cases

From these figures it is evident that most of the "relative" impotence cases were in the age group 41 to 60 years. If these figures can be confirmed by further observation and study, it will prove beyond doubt that in many cases which did not respond to routine treatment we have been expending our energies on an erroneous diagnosis and a misconception of existing conditions

These cases of relative impotence, referred to the wife alone, are of great sociologic significance for the impotence may and often does result in breaking up the home. There are innumerable underlying causes for this type of impotence, a few of which will be considered. The impression often has forced itself upon me that the husband is not always as greatly concerned about his sexual failure as the wife. The man often becomes reconciled to his condition, probably in the belief that because of his advancing years his sexual life is finished, that nothing can be done for him in any event, and he might as well spare himself the trouble and expense of treatment. But with the wife the reasoning is different. With the possessiveness so characteristic of her sex, she often feels that the alleged impotence is but a sham, that the man is diverting his energies to other women and that if he is doing anything in the sexual line she and she alone is the rightful participant a proprietary interest in his sex In consequence, she may develop a neurosis which may attain the status of a delusion she may create a domestic tempest, and/or she may insist on his seeing a doctor. It is probably correct that for every married man who consults a physician because of impotence there are a hundred who have gone along for years without conjugal relations because of lack of sexual interest and without seeking medical attention Many men regard this condition as a normal and inevitable sequence of marriage

As a general rule women know nothing of the male climacteric. They believe that male potency is one of the physiologic functions like digestion or climination, one that goes on automatically throughout the life of the man tually, however, while potency is a natural function like those mentioned it differs in several essential respects first, it tends to diminish after maturity until in old age it disappears en tirely, second, potency is largely under the control of the senses and the will (ego control) and can be inhibited for long periods consciously through sublimation Exceptionally women recognize impotence as concomitant with advancing age but the man must be really aged before the average wife will satisfy herself that his alleged impotence is something real and not a deception intended to blind her to extramural The average wife cannot under philandering stand why her physically and mentally vigorous husband, still able to do a hard day's work at his business or job is unable to function sexually as energetically as when he was thirty

The situation is complicated and made more difficult by the fact that the woman's libido does not necessarily decrease with age. In fact, fe-

male libido may and often does increase with the approach of the menopause, ironically just at the time when the husband's capacity is diminishing with the onset of his climacteric. Incidentally, women often fail to discriminate between the libido in the male and his potency. He may lose both as he grows older or, as is frequently the case he may rotain his libido and lose his potency. In any event, the wife usually is the aggreed party and she usually makes life misemble for her mate with conjugal expectations which he cannot fulfill

It goes without saving that her intuition may be correct, the impotence may be referable to her alone and the husband may be satisfying his libido in forbidden pastures But that is true also of some men who are not impotent at home There always have been philanderers and always will be, and the same is true, to a lesser degree perhaps of married women as well as men these cases are not within our concern solely concerned in the cause of our patients alleged impotence and its cure. We must make every effort to discover the cause and the type of the dysfunction and we will often find that the cause lies not in the man but in the woman, his wife.

Sex attraction is not static, it is dynamic and subject to all sorts of sensual impressions. With the passing years of marriage, the novelty and the instinctive element of pursuit and conquest in sex usually wane. The relationship is no longer that of the woose and the woosed, affection and devotion based on mutual helpfulness and loyalty take the place of the lustful desire so characteristic of heetic youth and early maturity.

Physical attraction is the meat upon which nsychic satisfaction of the male libido thrives The female body beautiful is nature's spark plug of male libido and potency Through the ages painters and sculptors have portraved the female body for the admiration and homage of men Though they did not overtly realize that they were subconsciously titillating their own libido and stimulating that of other men by their work that is what it really amounted to and why they found the female body such a delectable artistic Although most women are at their prime and most attractive sexually in the forties and many even in the fifties and sixties certain physical and psychic changes occur in some women, prespective of the menopause which may have a devastatingly inhibitive effect on the notency of their husbands. It is these changes which presently concern us. It is true that all men are not psychically affected in this manner. but many are and in different ways. We must

recognize these sensitive men if we are to treat their impotence with some measure of success

The changes referred to are of various types Psychically, the woman may become a realous shrew, realous of the fact that her husband, though older than she, nevertheless shows fewer evidences of the ravages of age The man may stand her nagging and complaints with complacency for a time but then there is a psychic re-Sexual attraction is inhibited and loss of libido and potency is the result. Or she may acquire slovenly habits Her husband, coming home from work and finding her with hair unkempt and slovenly attired, instantly may lose whatever sexual anticipations he may have enter-The possible psychic tained during the day changes which adversely affect potency are too numerous to be mentioned in detail here

The physical changes which occur in women are more common but no less inhibitory in char-Principal among these are extreme obesity, marked hypertrophy or atrophy and sagging of the breasts, hirsutism, drying of the skin, thickening of the ankles and legs or changes in Any of these subconsciously may affect the esthetically sensitive man to the detriment of his libido and his potency. To those mentioned may be added the diminished coital friction in women with distended vaging due to repeated parturition. It is unfortunate but these changes do have this inhibitory effect Usually loss of affection or devotion or conjugal fidelity are not involved, these remain unaffected It is purely a psychic inhibition, a paralysis, so to speak, of the man's sexual center in relation to this particular woman brought on by some physical or psychic change in her which has an inhibiting effect primarily on his libido, and secondarily on his potency

In the 49 cases of this series in which the impotence was found to be relative and not absolute, the causes of the inhibition were found to be mordinate obesity, 14 cases, hypertrophy of the breasts, 12 cases, atrophy of the breasts, 9 cases, hirsutism, 4 cases, alopecia, 3 cases, thickening of the ankles and legs, 4 cases, total, 46 cases

The vogue of the beauty salon is not merely the expression of women's innate desire to look young and attractive, but it indicates the correctness of their intuition or instinctive aim to retain their sex appeal and thereby preserve the libido and potency of their husbands

To be somewhat more specific, women know that the human male "likes'em young" The attractive, young female gives the male libido that lift with which the older woman attempts to compete by resorting to the devices of dieting, face-lifting, hair-dyeing, plastic

surgery, and the mysteries of the foundation and the bra

In this connection, we also must consider the man who subconsciously cannot forgive his wife for not presenting him with a male heir some men the desire for a son virtually becomes an obsession, and the fact that there is no son constitutes a mortal hurt to their pride and am-The man may not consciously realize it. but sooner or later the resultant effect is to alienate sexual interest in the wife and in effect. induce a subsequent inhibition of his libido and/ or his potency Many women, childless in their child-bearing years, realize what is happening to their husbands and practically devote all their thoughts and energies to the physiologic task of becoming pregnant They travel from one gynecologist to another, undergo major surgical operations or artificial insemination, all in the hope of producing an heir and thereby continuing to maintain the sexual interest of the husband This particular type of impotence was present in 3 patients of this series In one, a man of 50, of fine physique and general health, the inhibition arose from the fact that after the birth of the first child, a girl, seventeen years ago, the son he longed for did not materialize and he felt that his wife was responsible, masmuch as it was demonstrable that his semen was fertile and he was fully potent His subconscious antagonism toward his wife took the form of relative impotence, though he tried without success to become recon ciled to the situation. In the 2 other cases, there were no children after fifteen and nine years of marriage

Obviously in the type of impotence under dis cussion, it would be shooting up the wrong tree to attempt treatment of the man No amount of local therapy applied to the prostate and verumontanum, no amount of gonadal hormones can have the slightest effect on the inhibition We must go further than that As the wife is the basic cause of the inhibition, she must be consulted and the facts explained She should be advised to take such measures as will remove or neutralize the inhibition in the husband tary regulation, plastic surgery, and any other possible measure should be undertaken in the hope they may result in some reversible effect At the same time, it may be on the inhibition possible to induce the husband to accept the change that has occurred as mevitable and to make the best of it Nearly all of the men involved in this report have told me they feel sympathetic and sorry for their wives, but they, nevertheless, find it quite impossible to rid themselves of the psychic inhibition, however sincerely they may try

One must conclude that in every case of impotence involving a married man, to use a hackneyed cliché, cherchee la femme. It is not always a simple matter to uncover these gynecic clues to the cause of the impotence, but it can be done through tactful and leading interrogation. Men usually do not consciously realize that they have been inhibited by the above-mentioned changes in their wives, but if asked specifically whother they have noticed any of these changes and if they have been influenced in any way by them, they will generally unburden themselves and talk freely.

The discovery of some form of urogenital pathology, the result of previous infection merely adds to the difficulty of diagnosis and treatment by presenting misleading clues to the real gynecic cause. In such cases we are apt to conclude, the factor of the six in the basic origin of the impotence and then devote wasteful time and energy to eradicate it, with little or no result. One always should be on guard to avoid this error A report of a typical case follows.

Case Report

A. B., aged 50 merchant, had been married for twenty-two years. They had three children aged 20 10 and 16 The wife had been declared normal by competent gynecologists. At the age of 20 he acquired a Neuserian infection which left him with a low-grade prostatovesiculitis without symptoms. For the past eight years, impotence (later proved to be relative) was treated on and off by several urologists by routine massage, injections, hormonos and sounds, all without effect. On persevering inquiry he revealed that his wife had developed enormously hypertrophied breasts which had irritated and dissusted him to the extent of inhibitors his libido

The situation was explained to him. He was told that the trouble probably was not in his gental tract, as would seem to be the case but in his mind—a psychic inhibition. If he could adjust himself to the change, the inhibition might be reversed. This is tred faithfully for a year without benefit. As an alternative the wife was advised to have a mastopixia done. This was accepted. An excellent cosmetic result followed, and a year or two later the husband reported that his libido was quite fully restored.

Our particular interest in this phase of impotence lies in the fact that generally we have failed to recognize the significant role of the wife as the cause of impotence in married men. There is no reference in the literature of the subject, so far as an intensive search has revealed It is hoped that this presentation may stimulate further study and investigation and point the way to a more intelligent and realistic therapy for this type of dysfunction

Summary

Male potency is highly susceptible to psychosomatic impulses. These may be either totally inhibitory, or relatively so — In the latter type, the inhibitory influence may be the result of certain psychic and physical changes in one woman the wife.

It is essential in every case of impotence in married men to elicit by direct interrogation the presence or absence of this gynecic factor for this will determine the correct diagnosis and appropriate therapy

MEDICAL RESEARCH GRANTS

Medical Research grants amounting to more than two million dollars have been recommended for the approval of Dr. Thomas Parran, Surgeon General, United States Public Health Service by the National Advisory Health Council. Grants are contingent upon appropriations by the Congress for the fiscal year 1948 which begins July 1 1947

Of the 193 grants that supplement existing funds of universities and other research institutions, the largest, \$105 800 was recommended for a study of syphilis by the Pan American Sanitary Bureau. Sums of \$52,454 and \$46,000 respectively were stated for the study of malaria by the University of Chicago and Christ Hospital Cincimati, Ohio. Six other grants were above a \$30 000 level.

Research studies involved cover a diverse number of subjects including tropical diseases, biochemistry

and nutrition, cardiovascular diseases, dental research gerontology hematology pathology physiology surgery antiobiotics, tuberculosis, bacteriology pharmacology radiobiology metabolsm and endocrinology sanitation, virus and richeticial infections, and public health methods. The use of grants-in-aid in pursuing these studies implies no degree of Federal control. The investigator may work with full independence and autonomy submitting only a brief concise report of scientific progress annually.

The National Advisory Health Council is established by Congress and aids the Surgeon General mearrying out the research programs of the Public Health Service Dr George Bachr clinical professor of medicine, Columbia University College of Physicians and Surgeons, was recently appointed to the Council.

FURTHER IMPROVEMENTS OF THE SIGMOIDOSCOPE

ALFRED J CANTOR, M D, Flushing, New York

ENDOSCOPIC examination of the rectum and sigmoid by means of a tubular instrument is a relatively recent development. The straight tube and head mirror of Howard Kelly (1895), the distally placed electric lamp of Pennington (1899), Laws (1899), Tuttle (1902), and Buie (1918), the proximal light source of Yeomans (1912), and Lynch (1914), the telescopic instrument of Gant (1923), all are important milestones in the development of sigmoidoscopy

The author's telescopic instrument for fluid sigmoidoscopy (1940), and his subsequent dryfluid modification offered further advantages. These instruments, however, were considered by the author to be too complex for any but specialist use. Thus, a design for general use combining a maximum of illumination and provision for close mucosal inspection with simplicity of operation is herewith described.

In preparing a design for an improved sigmoidoscope it became evident that there were advantages and disadvantages in both the proximal and distal lamp instruments When the lamp is located near the examiner's eye (proximal site). the light is diffused over the area under inspection and close examination of early tissue changes is either difficult or impossible When the lamp is located near the distal end of the tube (furthest from the eye but nearest to the mucosa, 1 e, distal site), the illumination is far better distal location, however, blood or feces often cover the lamp and interrupt the examination This is a serious defect of such illumination

It thus becomes apparent that a lighting system embodying the best features of both proximal and distal illumination would give a vastly superior sigmoidoscope, even if no other changes were made Such a system should permit ready change from proximal to distal illumination, or vice versa, by a simple switch (Fig. 1) the distal lamp were to be obscured by feces or blood, a flick of the finger should permit immediate illumination from the proximal lamp The examination need never be interrupted If the distal lamp could be cleared readily of obstructing material without disassembling the instrument, a still further advantage would be obtained This is also provided for in the new instrument 1(4))

The diffusion of light from the proximal lamp has already been mentioned as a defect in the ordinary sigmoidoscope. The new instrument provides a reflecting device for focusing this light source as a spot on the area under examination.

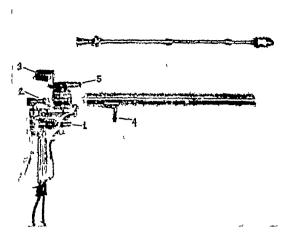

Fig 1 The obturator is seen above The examining sheath and handle assembly are separated (1) Switch for control of distal lamp (at end of sheath) (2) Proximal lamp with reflector cap (3) Telescope this swings down to examining position (4) Air or water inlet to tube that extends the length of the sheath and opens just behind the distal lamp. This is used to clean the lamp when obscured by feces, blood, or mucus (5) Spring lock to hold the telescope in desired position.

This can be arranged for any length of tube, either for sigmoidoscopy, proctoscopy or anoscopy (Fig. 1 (2))

For further improvement of vision a telescope is provided. This allows for magnification and close inspection of suspicious mucosal areas. The telescope is readily pivoted out of the line of vision and should be used only for careful inspection during withdrawal of the instrument and not during the routine insertion of the sigmoidoscope (Fig. 1 (3))

The same device that permits ready cleaning of the distal lamp also allows for suction of liquid feces or blood from the bowel lumen and for irrigation. A simple bulb attachment is adequate for this purpose. The bulb is used to force a sharp blast of air through the tubing surrounding the distal lamp (the light well), thus blowing away any obstructing foreign matter about the lamp. Similarly water may be forced through this channel for the same purpose, or liquid feces or enemaretention fluid may be withdrawn by suction.

A pistol-grip handle is provided to facilitate manipulation. This is constructed in a narrow width so that it will not interfere with the examiners who prefer to hold the sigmoidoscope by the body of the tube during insertion (Fig. 2)

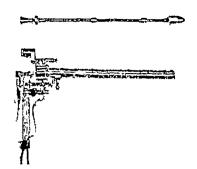

Fig 2. The sheath and handle are connected Examination can be performed with the unit thus assembled and the obturator in place. Another technic is with the obturator in the sheath for introduction of the instrument attaching the handle after the obturator is removed.

Summary

This instrument provides both proximal and distal illumination with a rapid-action switch to permit facile change-over from one lighting system to the other. The examiner may thus avoid

interruption of examination if the distal lamp (the preferred illumination) becomes obstructed by feece or discharge. A device is also incorporated to allow rapid removal of such obstructing material by suction or by air or fluid pressure. The proximal lamp assembly is designed in such a fashion as to permit focusing of the beam upon the area under inspection, whether it be for sigmoidescopy proctoscopy, or anoscopy. Diffusion of light is thus obviated

A telescope provides further aid for close mu cosal inspection The pistol-grap handle design facilitates case of manipulation of the instrument.

This new instrument is not complex and will increase greatly the accuracy and ease of examination for the general practitioner as well as for the proctologist and gastroenterologist. It combines simplicity of handling with maximum illumination and vision

JAUNDICE FOLLOWING PLASMA TRANSFUSION—RECORDING OF LOT NUMBERS ESSENTIAL

The problem of homologous serum jaundice first attracted widespread attention in 1942 when over twenty-five thousand members of the armed forces were infected with jaundice through the use of hu man serum employed in the preparation of yellow fever vaccine. Since that time, numerous other instances of jaundice transmitted through blood and certain blood products have been brought to light the causative agent presumably having been introduced through the use of blood from an infected donor. The period between transfusion and the onset of jaundice is usually two to three months, although it may best months or more.

The State Department of Health has recently undertaken a statewide blood bank program and it is imperative to determine the frequency with which serum jaundice may be expected. At the present time the Department is attempting to follow up selected groups of persons to whom plasma was administered six or more months ago. Preliminary findings seem to indicate that about 5 per cent have suffered from hepatitis during this period. This is not inconestent with reports by English investigators which show that the incidence of jaundice following the use of plasma may be as high as 7 per cent.

In addition the Department has recently checked thrty-six death cortificates on which Jaundice is mentioned as a cause of death. In seven instances, the deceased had received blood or blood products two to six months prior to death. The clinical data obtained indicate that each death was due to ful minating hepatitis and that the initial illness necessitating the use of blood transfusion did not contribute directly to the fatal outcome. Six of this group had apparently received Red Cross plasma On further follow-up it was possible to determine the lot number of the plasma involved in only one in stance.

It is apparent from this and other observations that in only a small minority of cases are the lot numbers of plasma recorded on the patient is hospital chart or reported back to the Department of Health knowledge of the lot numbers of plasma or other blood products which have been administered will be essential for the routine determination of the frequency of the association of plasma or other blood products with jaundice. This information can also be of great mactical value in the recall of lots of plasma which early experience has shown to be intercognic.

Since it is urgently necessary to assess the whole problem of homologous scrum jaundice, all physicians are urged to record the lot numbers of all plasms or other blood products administered and promptly to report all cases of jaundice which are observed following transfusions of blood or blood products.

It is hoped that practical means will be developed to destroy the jaundice-causing agents in plasma without affecting the useful properties—
Health A ers, April 14, 1947

THE ASSOCIATION OF MERALGIA PARESTHETICA WITH SCIATICA

ARTHUR ECKER, M D, Syracuse, New York

(From the Suracuse University College of Medicine, Department of Surgery)

MERALGIA paresthetica is marked climaterial aspect of the thigh. The symptoms are aggravated by standing or walking and may be associated with a burning sensation or pain. Both thighs may be affected and usually there can be found slight loss of appreciation of light touch, pain, and thermal sensation in the affected area. The area in which light touch sensation is diminished is the most extensive. This syndrome is usually due to pressure or tension on the lateral femoral cutaneous nerve

In 1938 the author1 reviewed the records of 150 cases of meralgia paresthetica In thirtythree (or 22 per cent) of these cases, the patients had sciatica or other pain in the back or hip In sixteen of these cases, meralgia was associated with low-back pain (lumbosacral or sacrollac) but there was no evidence of sciatica. In twelve cases, sciatica and meralgia occurred on the same side, although not necessarily at the same time. in two cases, bilateral meralgia was associated with unilateral sciatica, and in three cases, bilateral sciatica was associated with unilateral There was no instance of contrameralgia lateral sciatica and meralgia

The relatively high association of meralgia paresthetica with low-back and sciatic pain, and especially the ipsilateral relationship, has represented a minor mystery. Ober suggested in 1935 that the iliotibial band was an important factor in the cause of both pain in the lower portion of the back, with or without sciatica, and, also, along the course of the lateral femoral cutaneous nerve. Today most cases of low-back and sciatic pain are considered of intraspinal origin, whereas meralgia paresthetica is a peripheral neuropathy.

In the last few years, the author has seen over a

dozen patients who suffered from low-back or sciatic pain in whom meralgia paresthetica had developed In each of these cases, the onset of the meralgia paresthetica began after the use of adhesive strapping or the use of a sacrollac belt In a few of these cases, the adhesive tape had extended as far forward as the anterior superior spine of the ilium Thus, irritation of the lateral femoral cutaneous nerve apparently arose either as a result of traction by the tape through the superficial fascia, or by compression of the nerve by the lower edge of the sacrollac belt more, in cases of sciatica, it is more common for the lower lumbar portion of the spinal column to be tilted away from the affected side would tend to put on the stretch the lateral femoral cutaneous nerve on the same side as the sciatic pain, and would tend to relax the nerve on the unaffected side Thus may be explained the frequency of insilateral meralgia paresthetica associated with sciatica and the rarity of contralateral meralgia paresthetica

Summary

The fact that low-back and sciatic pain was present in 22 per cent of the cases of meralgia paresthetica has long been a minor mystery Clinical observation of several patients with this association of syndromes has shown that meralgia paresthetica resulted from the use of strapping with adhesive tape or the application of a sacrolliac belt for low-back or sciatic pain. Thus, in association with sciatica, as elsewhere, meralgia paresthetica is caused by pressure or tension on the lateral femoral cutaneous nerve

Correction

Professor Harold W Thompson, of Cornell University, contributed a very interesting article, entitled "Medicine in New York Folklore," to the April 15 issue of the Journal Inadvertently, in a footnote it was stated that he was deceased We are informed that, in the words of Mark Twain, this is a "gross evaggeration" We apologize for the error, the source of which cannot be traced and we are happy to make this correction

SOCIAL TRENDS AFFECTING MEDICAL CARE

LEO E GIBSON, M D Syracuse New York

A MONOGRAPH written in 1878 by Henry J Biglow, M.D., professor of surgery at Harvard University and surgeon to the Massa chusetts General Hospital, began with these words "When Sidney Smith asked What human plan, device, or invention, hundreds of years old does not require reconsideration?' he would have no doubt regarded with favor an occasional reconsideration of the theory and practice of medicine and surgery, especially in view of the current belief that their traditions have been kept alive, and their rule prescribed, in part, by authority"

The beginnings of medicine go back farther than man's records, but some of its most glittering epochs are comparatively new Homer had written his Odessey at a time when diseases were treated by superstitious rites. Chaucer had written Canterbury Tales two centuries before a ligature was applied to a bleeding vessel. Rembrandt had painted his great picture, "The Anatomy Lesson," two-hundred years before Pasteur linked bacteria with disease, and Michelan gelo was spreading his canvas with infinite beauty long before this. Although the science of medican was bringing sympathy, cheer, and restoration of health

Only after years of experience in that unique relation between the physician and his patient sorely buffoted by misfortune, after blunders immeasurable, after chances that have been lost forever by a single word, said or unsaid after failures that were so nearly becoming successes but for a method that was neglected, or an assumption that was premature, after humiliations and disappointments and misunderstandings, only then have we come to appreciate all that this relationship can mean in human life and affairs of our own world

The history of medicine is a history of the dynamic power of the relationship between patient and doctor. Through the centuries, when doctors were doing more harm than good this dynamic force of relationship between doctor and patient has sustained the esteem of the medical profession has inspired other groups with such faith in its values that they were willing to lend their economic support to the doctor.

In such a world we are anchored by sentiment, by our possessions, and by our positions As in dividuals we might have had some worries about our own success and security, but we have not been troubled about the stability and perma nence of the whole world Today no such assur ance is ours. The entire social and political organization within which we live is under attack Before we can continue to maintain our own places in American life, we must attend to reestablishing the place of American life, itself, in the world

This is a day for easting up accounts between the individual and society. We have reason to believe that in this process our own little world is in for some pretty thorough overhauling. To ask why our accounts are not in normal balance is probably as futile as to ask for a definition of the universe and give an example, but the prescription for putting them in balance is our challenge.

Jonathan Forman has attempted to solve the first part of our dilemma in these words "It is characteristic of the human mind to want a drug to cure its disease and save it from the penalties of its own violations of the laws of life, just as it looks always for a prayer or penance that will save it from the slas of its own soul"

In the past man has turned to science, which extended its promises of salvation, salvation by means of water closets, bathtube, automobiles, necosalvarsan, sulfa drugs, antitoxin, vaccines, and now antibiotics.

Now man is turning to science's stepchildren, economics and politics, which describe a kingdom of heaven filled with garages for two cars instead of one, an ever-normal granary a quart of milk for every child, and a free doctor at everyone's beck and call twenty four hours of the day

We have to live too much by the figures of the speedometer and stockbroker's tape, our slightest wish must have instant and expert attention. Even when one-third of our physicians were in the armed forces, it was much easier to obtain medical attention than it was a generation ago. In those days, the terrors of diphtheria, typhod and smallpox, long since eradicated by medical science, sent a messenger on horseback, over roads which were well nigh impassable sixmonths of the year, after a doctor who did well to reach his patient by the next day

These higher standards of living have decreased our mortality rates it is true, but at the same time has increased our pride. We become unduly exercised for what is termed lack of adequate medical care, many complaints are those of

alarmists and not justified by fact. The exponents of more medical care have yet to define adequate medical care

The prewar years trained the American people to buy protection against all calamities, fire, theft, liability of all kinds, and death, all on easy prepayment plans. The remainder of their incomes was spent on much that was not needful to good living. A man's social position was often determined by the type and equipment of his summer camp, yet, many productive generations have lived longer without them. With all these gadgets came the system of installment payments. With installment payments came the inability to finance a catastrophe. All of this has made the problem of medical care essentially one of politics and economics.

Politics, since the first savage learned that he could coax, rather than scalp, his way to favor, has had a productive course. Call the attention of the people to the many things they do not have and promise to provide them, and you have reached the top. An immediate passage of vicious legislation, destructive to the present system of medical care in its entirety is doubtful A controversy has been raised and offers excellent political bait for future knights of the whirling intent on destroying the profit system, making a little more progress each time

We engaged in a world war to prevent the usurpation of power by the state over the individual The totalitarian states were defeated, but it has often happened in the past that the ideas of the vanquished have conquered the conqueror Something like an ideologic totalitarian conquest is even now under way right within the very democracies which were pledged to its de-The basis of this idea is an exaltation of the state which takes command of the individual from the cradle-to-the-grave It begins as a welfare problem which involves all the essential needs of the individual, brings him into the world, schools him, provides him with work, supports him in sickness and takes care of him in At last the individual becomes completely dependent on the state and the state has acquired complete control over him. We are in a period of economic and social revolution and no one can see the future, but it certainly tends toward more complete central government—central and bureaucratic government

Doctors remain like ostriches with their heads in the sand. The specialists are the worst offenders, but a large percentage of other practitioners do not want to disturb the status quo—their incomes at present are too good. What they do not understand, they oppose. They are terrified with any significant change. They fear change as an upset that may affect them. They

feel confident and secure as long as the set of circumstances in which they have lived is preserved to the last detail They are afraid to make new judgments and to depart from the old ways no matter what the signs of the times may be Such men confuse the councils of society We fail to realize that England, France, Czechoslovakia. and China have become socialized, that private banking has been eliminated in foreign fields and limited in its activities domestically, that labor has risen to political power, and taxes are being utilized to equalize the earnings of all persons. and that many other changes are affecting the economic and social structure of all countries What we should have is a calm confidence that we are sufficiently useful to survive any upset

No one who views the national picture can question the evidence that is accumulating of the continued encroachment of certain lay-controlled agencies into the practice of medicine, such as the hospital, the Blue Cross, and the Federal Government

The hospital participates by offering certain medical services on a service-basis as a part of hospital care, and there are indications of an increasing desire on the part of the hospital management to increase these services

In the past, certain general service physicians, the radiologist, pathologist, anesthetist, and physiotherapist, engaged themselves to the hospital, and, probably without fully realizing the implications of their position, placed themselves at the disposal of the hospital on a salary basis, thus becoming agents of the hospital This situation permits the accusation which we hear today, namely, that the hospitals are corporations which are practicing medicine It is not difficult to visualize that such hospitals with the addition of an internist and surgeon on the same salary basis, would exist as a complete medical unit These physicians are engaged in the practice of medicine, as employees and agents of the hospital The hospital is then engaged in the practice of medicine, a situation which is not legal in many states, but, what is even more important, it violates the principles of ethical medical practices If this system becomes prevalent it would limit the hospital privilege to physicians not so employed and interfere with the free choice of physician on the part of the patient

The resolutions of the House of Delegates of the American Medical Association is pertinent to this situation "that hospital corporations should not be permitted to engage in the practice of medicine through the medium of employed physicians or to enter into contract with any individual group or agency whereby the hospital agrees to furnish any medical service" and "that all fees for medical services rendered in hospitals

hould be collected by or on account of the hymician rendering such service, and all physiians concerned in the care of a patient should ave or send directly to the patient, or to the esponsible party a statement showing charges or professional services rendered.'

The plight of the hospital itself, however, is liscouraging. The cost of administration has necessed thirty to-fifty per cent and perhaps nore in some instances. The cost for patient are is fast approaching \$10 per dem. This will con be prohibitive. The hospitals then must sk for Government aid a condition which builds nother plank in the platform of State Medical Zare. The distress of a far reaching financial lepression is undesirable. If the fundamental conomic laws of supply and demand are not sermitted to obtain a depression is inevitable and even desirable to rescue us from this economic chaos.

If the Blue Cross establishes the comprehensive program which is now prepared and includes aboratory service, radiology, physiotherapy, ardiology, anesthesis, it will cement a certain mount of medical care as a part of hospital are and guarantee to the subscriber not only sed, food, and nursing care but also the services of the doctor

The Bureau of Medical Economics of the American Medical Association in its principles recommended for guidance in the establishment of group hospital plans includes the following statement in regard to this program "The subscriber's contract should exclude all medical service—contract provisions should be limited exclusively to hospital facilities."

We do not know what type of legislation providing medical care will finally be established by the Federal Government. It is evident, however that all these agencies seek to emulate the assumption of the reformers, that all the financial barriers involved in providing medical care will be surmounted by the interposition of a third party between the doctor and his patient.

While controversy advertuses and experience illuminates the issues of medical care, the challenge to the profession consists of three essential tasks

First To define through the joint work of progressave physicians and informed lay groups policies which will permit adoption of prepayment medical plans to serve more of our people and which can be incorporated into legislation

Second Joint participation by the public and the profession in the administration and organization of medical service. When people visit the large clinics they see these two factors at work. These are the things they understand

That The third task properly executed would go far to help solve our dilemma. Correct understanding of medical welfare and the analysis of misstatements. The public is completely ignorant of the contribution of the profession to wel fare patients and to medical education. Such statements as that published by the Interdepartmental Health Conference, namely, that forty million people in the United States do not receive proper medical care, should not remain unchal lenged. These issues are only specimens of the many for which an aggressive agency is now needed, working in cooperation with organized labor and other bodies

The time has come when we individuals must realize the urgent need for a new specialist among us, a specialist in public relations long has this activity become a chronic neglect. We lack the incentive and ability to translate our ideals and problems into terms which the general public understands. In the immediate fu ture the public will decide the fate of private practice. If the public becomes able to analyze the promises of the socializers it must be edu cated This cannot be done with a few pennies Medical dues must be increased The California Medical Association increased its dues to provide a grand total of \$300 000 but they were successful in defeating undestrable legislation. The most effective educator of the public is the individual physician The physician who pleads ignorance of the benefits offered by the prepayment plans. or who fails to appraise his patient of the dan gers inherent in the interposition of politically controlled agencies between himself and patient is a deterrent to progress.

These postwar years will continue to be uncertain. There may be prosperity for a few years
more. If we succeed in promoting international
trade, in preventing another world war, and in
establishing amicable relation between labor and
management, it may outlast our time. The
rapid revival of installment plans may eventually
impoverish our people while it provides physical
sustenance it robs them of their occonomic secentry and destroys their ability to finance catastrophic illness.

When a people is insolvent it will sell its liberty for security. In the next few years we must use our power to compromise we have lost our power to dictate, use it so that somewhere between the convent and the gutter there will be a place where most of us may dwell, where the economics and politics surrounding medicine will be sobered by the strength of science

BACILLUS PYOCYANEUS IN URINARY TRACT INFECTIONS

JOSEPH A LAZARUS, BS, MD, MORRIS S MARKS, BS, MD, and LEWIS H SCHWARZ, BS, New York City

WE PROPOSE to discuss the significance of Bacillus pyocyaneus in infectious uropathies, with special reference to its behavior toward streptomycin

A common misconception among surgeons and urologists is the belief that B pyocyaneus is purely a "nuisance" organism showing saprophytic rather than distinct pathogenic tendencies, and difficult to destroy. The reason for this erroneous belief is the failure to differentiate, by in vitro and in vivo examinations, the various strains of bacteria belonging to this group, and, particularly, the failure to ascertain by means of proper assays the degree of virulence of the members of this group

The Organisms

Bacillus pyocyaneus for years has been recognized as the organism which produces "blue pus," and much speculation has arisen regarding its role as a primary invader and its degree of pathogenicity in human beings. As far back as 1890, there was a diversity of opinion regarding the role which this organism played in disease. Marthen¹ (1890), in his dissertation, discussed the implications of the "blue pus organism," and placed special emphasis on the occurrence of paralysis in patients and laboratory animals infected with virulent strains of B pyocyaneus.

In regard to the virulence of B pyocyaneus in infections, Edel² was able to collect several examples from the literature with fatal terminations. Bernhardt³ and Klieneberger, reported cystitis and nephritis as caused by this organism. Loder⁵ found that experimental animals frequently succumbed within six to twelve hours with a severe terminal drop in body temperature. Generalized infections with B pyocyaneus, while rare in healthy adults, are more common in children and debilitated adults (Musser and Sodeman) These authors maintained that paralysis of smooth muscle and paresis of the leg muscles, with subsequent atrophic changes, may occur as a result of absorbed pyocyaneus toxin.

Although a considerable literature has accumulated on the bacteriologic and, to a less extent, climical aspects of the Pseudomonas aeruginosa, little work has been done in differentiating the various strains of organisms constituting this group. Bacterial variability or mutation is often discussed by bacteriologists, but rarely is it referred to in examples of infections with atypical organisms in the field of urology. This is by no means a purely academic problem, since it is likely that in a transposed form an organism may play an entirely different role than in the parent strain.

It is known, for example, that the relative degree of virulence of certain bacteria can be roughly estimated by the character of the colonies they produce on agar plates Those which fall within the so-called "S" or smooth category are believed to exhibit increased virulence (Figs 1 and 2) The second group, known as the "R" or rough group (because of the irregular surface presented by the colonies on the agar plate) consists of organisms showing a lesser degree of virulence. The third category, of which only slight mention has been made in the literature, is known as the "M" or mucoid group, because of the mucoid appearance of the colonies (Figs 3 and 4). Bacteria, belonging to the three groups, may occur singly or in association. We will deal primarily with the SM strain of P aeruginosa (Fig. 5).

Concerning the apparent innocuousness of certain strains of B pyocyaneus, it is our impression that the organisms belong to the general group of pseudomonas fluorescence. In any event, we believe that when B pyocyaneus is isolated from the urine, appropriate examinations should be made in order to determine its pathogenicity and virulence.

Laboratory Procedures

Fresh urinary specimens collected under strict asceptic precautions should be routinely examined by smear and culture in all urologic investigations. Negative smears of thoroughly centrifuged urines do not necessarily indicate absence of bacteria. We have repeatedly found this to be the case, and, contrary to what has frequently been advocated, we routinely culture all urines, regardless of the results of the smears.

B pyocyaneus is frequently overlooked because of the common tendency to inoculate urines into broth media. In the presence of a multiplicity of organisms, B pyocyaneus may be overgrown by bacteria possessing a more luxuriant growth propensity, making it impossible, on the transplanted agar plates, to isolate and identify the P aeruginosa group. To overcome this difficulty we have found it advantageous to streak blood agar plates immediately at the same time the broth media are inoculated.

Is the Organism a Contaminant?—Whenever an unusual organism is isolated from urine cultures, the question invariably arises as to whether it is or is not a contaminant. Owing to the serious consequences which may result from urinary infections due to organisms such as the B pyocyaneus, the question assumes more than mere academic interest. It is our confirmed opinion that if proper precautions are taken in procuring and transporting urinary specimens, contamination does not occur

Necessity of Early Diagnosis of B Pyocyaneus Infections—In order to minimize the hazards which frequently follow infections due to a virulent strain of P aeruginosa, it is necessary at the onset of symptoms to ascertain the presence of the organism. This can only be accomplished by routine bacteriologic examinations in all new patients and those showing any indication of urinary tract infection.

Fig 1 Photograph (× 500) showing smooth plain colonies (Case 4)

Fallure to do this may subsequently lead to blood stream invasion with its attendant dangers of diffuse or localized visceral abscesses or fatal septicemia.

Susceptibility of B Pyocyaneus to Chemotherapy—
The pathogenic strains of P aeruginosa are extremely resistant to drug therapy. They are not
affected by the sulfonamides or by penicillin. Since
Waksman and his associates' demonstrated the strong
bactericidal action of streptomyein on both gramnegative and gram-positive bacteria, including almost all of those found in urnary tract infections
several investigators have stressed the effectiveness
of this snithiotic in dealing with the pathogenic
variants of the P aeruginosa group which are
totally resistant to other urinary tract antisepsis

Our work with streptomyon in the treatment of urmary tract infections with B pyocyaneus, begun May 6 1946 reveals the following significant data

Case I—Mr J P was operated on by the senior author in March 1940 A right nephrectomy and subtotal ureterectomy was performed for suppurative prelonephritis ureterius, and multiple renal calculi. During the course of routine follow up urologic examination (April 9 1940) a gram negative encapsulated rod was recovered from the bladder urinary specimen showing all the characteristics on culture of an organism belonging to the mucoid strain of P aeruginosa. In vivo studies readily disclosed that we were dealing with a virulent bacterium of great toxicity which in doses as low as ½, ml. proved rapidly fatal to mice weighing 20 Gm A careful asay disclosed that the growth of the bacteria was definitely inhibited by streptomycin in concentrations of 75 units per ce but was in no way influenced by penicillin or the sulfona mides

A rabbit was subsequently moculated intravenously with 3c of washed suspensions of organisms, followed by two doess of streptomycin 10 000 ml crograms each. Within forty-eight hours the animal developed hyperpyrexia, hind limb parallysis, and diarrhea, and succumbed Postmortem disclosed multiple abscesses throughout viscera.

A second rabbit was inoculated with 3 cc. of a broth culture of the organism intravenously followed in twenty four hours by one dose of 20 000

Fig 2. Microphotograph (× 1,200) showing smooth colonies (nonencapsulated) B pyocyaneus (Case 4)

micrograms of streptomycin Recovery was complete in five days.

A guinea pig which was moculated with 5 cc. of a month-old growth of this culture transplanted weekly to bactotryptose broth media succumbed in thirty-six hours. Postmortem revealed similar lesions.

In order to ascertain the toxic source experiments were carried out in which (1) the pigment pyocyanun which was extracted from a ninety-six-hour tryptose broth culture of B pyocyaneus (mucoid variety) was inoculated intraperitoneally into a guinea pig No untoward effects were noted (2) Eight oc of a toxin filtrate was injected intraperitoneally into a guinea pig This was followed by a convulsive sezure lasting twenty-five ninutes, hind limb paralysis and semicoma. However complete recovery occurred in seventy two hours. (3) Another pig received 5 oc. of a four week-old tryptose broth culture of B pyocyaneus (a daughter strain of the original mucoid colony isolated from Case 1 two months previously). Five minutes lates the animal developed urinary incontinence partial hind limb paralysis and coma, and succumbed in forty-eight hours

Our experiments indicate that (1) even old cultures of the mucoid variant of P aeruginosa retain their high degree of virulence (2) the bactern-free filtrates are not fatal to laboratory animals and (3) the pigment, pyocyania, seemingly plays no role in the pathogenicity of the organism. It appears, therefore, that the toxicity of the mucoid variant of P aeruginosa is probably due to an endotoxin which causes a multiplicity of viscoral lesions

Treatment

On reporting our laboratory data, 5 Gm. of streptomycin equivalent to 5 million inferograms of streptomycin sulfate was allotted to us. The initial does (May 7, 1940) was 500 000 micrograms, which was followed by a similar does three hours later, and then 100 000 micrograms was administered at three-hour intervals. A urnary culture made after the second does of the drug was storke and remained so until June 7, 1940 when a pure culture of a smooth strain of B pycoyaneus was isolated. Careful study of this organism showed it to be nonecapsulated motile much less virulent

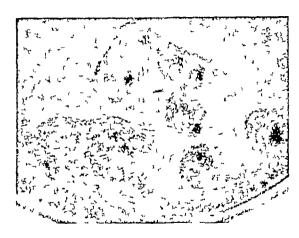

Fig. 3 Photograph (× 500) showing smooth mucoid colonies (Case 1)

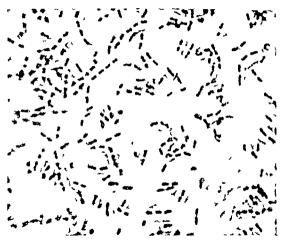

than the mucoid strain, as shown when injected intraperitoneally into a four-pound male rabbit The only effect noted was an abscess at the site of inoculation A urine culture, taken June 19, 1946, disclosed a pure culture of the mucoid strain, the organism showing characteristics identical with those of the original strain, except that its virulence was decidedly diminished A four-pound albino female rabbit was inoculated intravenously June 25 with 4 cc of a twenty-four-hour culture (washed suspen-The only result was to make the animal extremely lethargic On June 27 the animal received 25 cc of a seventy-two-hour tryptose broth culture (organism and toxin) intravenously Within three minutes the animal became restless, and after five minutes had two convulsive seizures Immediately after the second convulsion it succumbed and was promptly autopsied

Autopsy disclosed perihepatitis, multiple abscesses of the liver, and a hemorrhage in the left orbit. There was, also, a pronounced leptomeningitis hemorrhagica involving meninges of brain and cord with hemorrhages and purulent evidate within the substance of those structures. Smears taken from the liver showed thick encapsulated rods (Paeruginosa) identical to those of the original culture

A bladder culture taken July 7 again disclosed smooth mucoid colonies of P aeruginosa on the agar plates, and encapsulated rods under the microscope. Two rabbits were inoculated, one intraperitoneally with 11,cc of a ninety-six-hour washed suspension of the organism with town and pyocyanin, the other received 3 cc of similar material intravenously. The first rabbit succumbed in twelve hours, the second five minutes after the inoculation.

A postmortem performed on rabbit number 1 showed evidence of pneumonitis and pinpoint abscesses in the right lung. The serosa of the large intestine, especially the cecum, was diffusely hemorrhagic. The stomach showed a spontaneous laceration measuring 3 cm in length at the cardiac end, with its contents present in the upper peritoneal cavity. The liver showed many abscesses. The kidneys and adrenals were apparently not involved, but the spinal cord was definitely hemorrhagic. Smears from the liver and lung abscesses, and, also, from the spinal cord, showed encapsulated rods (Paeruginosa)

In view of the highly pathogenic character of the

 F_{IG} 4 Microphotograph (\times 1,200) showing smooth mucoid colonies (encapsulated) B pyocyaneus (Case 1)

mucoid strain of B pyocyaneus seen in animal experiments, and the few symptoms shown by the patient, we instilled 2.5 cc of a ninety-six-hour broth culture into the bladder of a full-grown female rabbit through a ureteral catheter. After seventy-two hours the rabbit developed urinary frequency but no other symptoms. A specimen of urine showed leukocytes and encapsulated rods of B pyocyaneus on smear and culture. Nine days later, despite positive urinary findings, the animal was totally asymptomatic.

totally asymptomatic

Comment—The outstanding features of this case are (1) the recovery of an unusual strain of P aeruginosa of the mucoid variety, presenting unusual pathogenicity and virulence, (2) the transient effect of large doses of streptomycin on the organism, (3) the reappearance of another strain (smooth) of P aeruginosa one month following the discontinuance of the drug, and (4) recovery of the original strain (mucoid) twelve days later. The question naturally arises as to whether or not we are dealing here with an example of mutation of bacteria or with two different strains of the same group.

In the former instance it would be necessary to postulate that streptomycin was instrumental in causing (1) a noteworthy but temporary bacteriostasis so that for one month after the discontinuance of the antibiotic, repeated cultures were sterile, (2) a change in physical characteristics of the organism in that the colonies lost their mucoid appearance, and the organisms their characteristic capsules, and (3) a definite decrease in virulency and pathogenicity. In the last noted instance we must assume the simultaneous presence of both strains of organisms at the time of taking the original culture, where the predominant one (the mucoid variety) completely overgrew and masked the other (smooth)

On the administration of streptomycin there occurred an abrupt inhibition of both strains more sustained, however, in the case of the mucoid variety, with the result that one month after cessation of the antibiotic only the smooth species could be recovered from the culture. A later culture, however, showed the mucoid organism again active and predominant, but displaying a less degree of virulency.

Fig 5 Photograph (× 125) showing two varieties of colonies—smooth to the left (Case 4) accompared to smooth mucoul to the right (Case 1) Note halo around colonies (Case 4) due to pyccyanne formation

Case 2.—Bilateral pyelocystitis. The organism was a smooth variant of P acruginosa. The treat ment consisted of 5 million micrograms of streptomycin and the result showed no effect

Case 3 -Bilateral pyelocyttitis. The organism was a smooth variant of P serugnosa. The treatment consisted of 7 million micrograms of streptomyeln, and the result showed temporary inhibition

followed by recurrence

Cass 4—Polycystic disease of kidneys. The

organism was a smooth variant of P aeruginosa

solated from bladder urine The treatment was

5 million micrograms of streptomycun with the result consisting of a temporary bacteriostasis after

the administration of 15 million micrograms

followed by recurrence

Case 5—Right pyclocystitis. The organism
was a smooth variant of P acruginosa. Treatment
consisted of 17 million micrograms of streptomycin,
and the result was the first negative culture after
9 5 million micrograms followed by cure

Case 6—Cystitis. The organism was a smooth variant of P aeruginosa. Treatment consisted of 5 million micrograms of streptomyen with the result a temporary inhibition followed by relapse.

As a result of our experiments and clinical observations we came to the conclusion that the bacteriostatic property of streptomycin, as regards its effect on members of the P aeruginosa group is far more certain than the bactericidal. While the experiments of Helmholz' suggest that streptomycin is an antihiotic capable of destroying P aeruginosa when administered in sufficient dosage our work in the clinic and in laboratory animal experiments casts considerable doubt on the validity of his conclusions, which only proves the fallacy of drawing hard and fast conclusions solely on the action of antibiotics in in vitro laboratory experiments.

Comment

We are convinced that in human beings as well as in laboratory animals streptomycin exerts a distinct inhibiting offect on B pypocyaneus, so that ur inary cultures made shortly after the administration of the drug in dosages of one-half to ten million micrograms over a period of five to seven days will frequently be sterile (Cases 1 3 4 5 and 0)

Follow-up urinary cultures taken one to two weeks later however frequently show that the organism has recurred (Cases 1 3 4 and 6) In regard to the mucoid strain, such as was present in case 1 we are inclined to believe that the drug may have been instrumental in bringing about some temporary alteration in the physical characteristics of the bacterium, as shown by the disappearance of its capsule. When this occurred, the organism seemed to have lost much of its virulence. This phenomenon was also a transient one, since cultures taken subsequently again showed the bacteria encapsulated with subsequent return (?) of their former virulence One culture remained positive throughout the period of administration of the streptomycin, and remains positive to date.

It is difficult to explain the discrepancy between the results obtained on plates and those observed in patients But the fact remains that it occurs, and for this reason the only dependable way of ascertaining the effectiveness of streptomycin on P aeruginosa is to make repeated urinary cultures. It is of course, possible that failure to destroy permanently the organism in all of these patients may have been due to insufficient dosage of streptomycin, although the doses were those recommended by the Division of Medical Science National Research Council, on receipt of our laboratory data On the occasion when cultures remained sterile after the discontinuance of treatment, the first negative one was obtained after the administration of 9.5 million micrograms. It is of course possible that too little time has elapsed following the discontinuance of streptomycin to state with certainty that cure is permanent. However if this is so in view of the fact that the organism in this instance was identical in every instance only one conclusion is possible—that permanency of cure was due en tirely to the massive desage of the streptomycin administered.

Efficacy of Streptomycin in B Pyocyaneus Infections of Urinary Tract

In treating infections of the urinary tract with an antibiotic as with any antiseptic drug, two important criteria must be kept in mind (1) Has it produced complete and permanent relief of all symptoms and physical signs of infection? (2) Has it caused a complete destruction of the causal or ganism? Although it would seem that full realiza tion of the first criterion would necessarily result in the accomplishment of the second this does not hold true in urinary tract infections with B pyo-The fact that a patient has been made evancus symptom-free that his urine has become acellular and cystoscopy no longer discloses evidence of in fection does not necessarily indicate that the causal organism has been destroyed. This can only be established by periodic culture examinations of the urine over a prolonged period especially when treating B pyocyaneus infections of the urinary tract with streptomycin. The validity of this, we believe is borne out by the aforementioned ex amples in which only one presumably showed no

recurrence after the administration of 17 million micrograms of streptomycin. A priori, it can be argued that the cause of failure in our series was probably due to insufficient dosage rather than to the inability of the antibiotic to destroy the organism.

If our conclusions prove correct, it would seem important, when using streptomycin against B pyocyaneus, to avoid (1) the possibility of provoking a state of resistance by the patient against this antibiotic, so that if subsequent circumstances make it exigent to use the drug against an organism known to be susceptible to it, its potency will not become appreciably or completely nullified, and (2) the possibility of preventing the establishment of a state of immunity by the organism toward the drug which would render it inert

Before releasing streptomycin for general use, we believe that higher dosages should be recommended for treating urinary infections caused by P aeruginosa

Summary and Conclusions

aeruginosa (B pyocyaneus) shows distinct pathogenic tendencies in urinary tract infections Three strains of this group which possess various grades of pathogenicity have been described, and special reference has been made to the mucoid variant and its extremely high degree of virulency Since B pyocyaneus is highly refractory to the usual urmary disinfectants, including chemotherapeutic agents as well as penicillin, an attempt has been made by in vitro and in vivo studies to evaluate the effectiveness of streptomycin as a drug capable of destroying it We believe that conclusions drawn from in vitro experiments alone fail to correctly evaluate the therapeutic action of this antibiotic, since results obtained have been found to be at great variance with those of the clinic and in laboratory animals

Streptomycin has been found ineffective in treating infections due to the mucoid strain of P aeruginosa in doses recommended by the Division of Medical Science of the National Research Council In only one of five patients, in whom the causal organism belonged to other strains, was the organism apparently destroyed. In this patient the total dose of streptomycin was approximately three times that recommended by the committee (17 million micrograms). In the others, the drug, in doses ranging from five to seven million micrograms, has failed to give permanent results

A permanent cure can only be brought about by periodic culture examinations of the urine at frequent intervals. We believe that streptomycin may be curative in infections of the urinary tract caused by all strains of P aeruginosa, except possibly the mucoid variant, provided massive dosages are used during the initial period of treatment Much more experimental work must be done, however, in order to evaluate correctly the potency of streptomycin in P aeruginosa infections before recommending it as the ideal drug to destroy this organism

"DOCTOR JONES" SAYS-

When I was a boy I knew a father and grown son that used to go out and get drunk together That wasn't a commendable sort of family program but, you know, as a 'teen-ager, I almost envied that young fellow being able to meet his father, as it seemed to me, on common ground and as man to man

I realized, well enough, that I had a better father No father ever was more interested in than that his children than mine was But he was a busy practicing physician and his practice took most of As a kid I loved to get up in the night and his time go off with him somewhere on a long country trip But when I got into my 'teens, when I most needed the kind of help and advice he could've given, sort of an intangible barrier seemed to grow up between It was the result, I'm sure, of uneasy conscience on my part and some inhibitions on his And that sort of situation, I've observed since, is the common thing between sons and fathers

Knowing the kind of man he was, I know now that if I'd gone to him honestly and frankly with the things that were troubling me, he'd have met me

sympathetically, "as man to man" and welcomed the opportunities to give me kindly and helpful counsel. It would've established an ideal father-son relationship.

What brought all this to mind I was reading an abstract of the discussion at a national conference on family life they had out in Cincinnati some time ago It'd be better for the girls as well as the boys, they said, if they and their fathers could get better acquainted But boys especially women dominating their lives from infancy on—it's responsible for many of their "subversive" reactions They need somebody that's been a boy himself and knows how it is Father should be something more than a provider and a last-resort disciplinarian

But the father that hopes to make good as a confidant and counselor to his kids needs up-to-date information. He can't be satisfied with the ideas on child guidance he picked up from his old folks. Yes, taking a course or reading books—it takes time. Whether the kids are worth it or not—that's something for Pop to decide—Health News, April 14,

CELLULITIS OF THE CHEEK COMPLICATING NASAL FRACTURE

ERNEST J ELSBACH MD, Flushing New York

(From the Department of Otolarymgology, Presbyterian Hospital, New York City)

DANGEROUS complications of masal fractures if no skull fractures are involved are infrequent, although secondary meningitis has been reported. Therefore it is of interest to report such a case of cellulities of the check and abscess of one nostril. No reference of such a complication has been found in the literature of the last ten years.

Case Report

E. K. a 20-year-old white woman, a student was seen in the office on the evening of May 18, 1940. She stated that the previous night about 12 30 A.m the automobile in which she was riding seated next to the driver, crashed against another car and her face was smashed against the dashboard. There was bleeding from the nose and face but not from the ears. The patient did not become unconscious. She was taken to a hospital and an adhesive strip was put over the bridge of her nose. An x-ray revealed a fracture of the nasal bones bilaterally near their extreme distal extremities. The patient complained about slight pelin on the right side of the face

On examination she was found rather pale (pre-mably her normal color) There were skin abrasumably her normal color) sions on the right check, upper lip and nose which were swollen and slightly tender to pressure nose was deviated to the left, and its lower part depressed The left nasal bone was movable and crepitation was felt. The intranasal examination revealed a small amount of coagulated blood and the right nostril was swollen. After cleaning and shrinking a vertical tear of the mucous membrane was noted over the left apertura piriformis identical spot on the right side could not be visualized due to the swollen nostril. Transillumina tion showed the right antrum cloudy due to the swelling of the soft parts. There were some lesions of the mucous membrane of the upper lip ear, nose, and throat examination was negative.

The tear in the muccus membrane and the abra

The tear in the mucous membrane and the abrations were painted with metaphen, the nasal bone kept in place with adhesive stripe, and a light vaseline gaure packing applied. Further manipulations were not undertaken because of the swelling. The patient was advised to apply cold compresses to the swelling and to return in two or three days.

Two days later in the forenoon I was called as the patient had ferer intensified pain over the right side of her face, and had had discharge from the nose since the previous night. The swelling had in creased and the nose was more tender to touch The right nostril was filled with yellow mucopus, the origin of which could not be determined since the nose was filled again immediately after cleaning and shrinking. Her temperature was 100 F. The packing was not reapplied and the patient was put on combisul D-T of which she took only 2 Gm., and use of prothricin by atomizer was advised. In the afternoon she felt much worse had chills, and a temperature of 103 F. Therefore she was admitted to Presbyterina Hospital-in the late afternoon.

At that time she seemed seriously ill the swelling was still more extended than in the morning the lids of the right eye were edematous, her face was bluish but she was alert and oriented. The narce were filled with much mucopus and the right nostril was very tender but there was no nuchal rigidity and kernigs sign was not present. The bluish color of the face was thought to be due to toxicity and dehydration. Therefore, an infusion of 5 per cent dextrose in 1,500 cc. saline solution was started im mediately. She was given 40 000 units of penicillin intramuscularly and 25 000 units every three hours. In addition she received 1 Gm. of sulfadiaxine with sodium blearbonate every four hours, because sulfadiarine penetrates the subarachnoidal spaces better than penicillin and it was thought advisable to use it due to the possibility of a complicating moningitis. At 9 00 r m the temperature rose to 105.2 F 100 000 units of penicillin were added to the infusion which was finished at 12 30 Am and alcohol rub was given. A blood culture taken at this time showed no growth. After a few hours the patient felt much better and the temperature had receded to 100 2 F about midnight. The following day it was 00 F, on May 22 it was 101 F and then romained normal.

A nasal spray of I per cent necspnephrine was administered and the nose cleaned by suction several times daily On May 22 an abscess in the right nostril was evacuated. Nose culture taken May 21 revealed a moderate number of hemolytic streptococci Another x ray, taken May 22, gave evidence of soft tissue swelling over the right cheek and thickening of the lining membrane in the lateral wall of both antra, which was apparently of remote origin and not related to the present filness.

The blood count on May 20 showed hemoglobin,

The blood count on May 20 showed hemoglobin, 12.3 Gm., red cells 4,690 000 leukocytes 16 600 On May 23 hemoglobin was 13.5 Gm red cells 5 250 000 leukocytes 8,400

Sulfadiatine was omitted on May 25, after she received a total of 24 Gm. and penicillin was stopped the following day after a total of 1,140 000 units had been administered. The swelling of the right cheek, nose and upper lip slowly subsided. She was discharged from the hospital May 27. The swelling had almost completely subsided when she was seen July 27, 1946. Only at this occasion the extent of the disfigurement of the nose as compared with a previous photograph could be appredated

Comment

A nasal fracture was complicated after about forty eight hours by a purulent discharge from the right nostril with high temperature. In the beginning it was not possible to find the source of this pusmight have been caused by a latent sinus infection. activated by the trauma and blood which accumulated after the accident in the antrum But the first x-ray did not show such an accumulation of blood, and the second one did not reveal any findings typical of an acute sinusitis. The diagnosis of cellulitis of the right cheek was made. It may be assumed that due to the accident the cartilaginous lower part of the nose was bent to the left side causing the tear in the mucous membrane which was seen on the left apertura piriformis and very likely also caused the same lesion on the right side, which could not be seen due to the swelling of the right nostril lesion the hemolytic streptococci, ever present in the nose, found a way into the soft tissues of the cheek and here a good culture medium presented itself in the crushed tissue The speedy recovery and the avoidance of further complications were due certainly to chemotherapy In the presulfonamide or prepenicillin era this case would have required extensive surgery and the outcome would have been doubtful

The nasal plastic surgery, which still is required to eliminate the otherwise permanent disfigurement caused by the fracture of the nasal bones and especially the depression and fracture of the lateral cartilages, was postponed several months, so that the infection would not be reactivated by too early surgery

I am indebted to Dr Herbert Friedmann, the chief resident, for his kind assistance in the care of the patient

US CHILDREN'S BUREAU HOLDS CONFERENCE ON CEREBRAL PALSY

At the first conference of its kind, specialists working with children with cerebral palsy—"spastics" met at the US Children's Bureau, Social Security Administration, Federal Security Agency, March 26 to 28, and pooled their experience preparatory to a major effort by the Bureau and State crippled children's agencies to get help to these "tragically neglected children "

The importance of providing continuity in the child's treatment, education, and training over the years was stressed throughout the conference assure this, it was pointed out, called for drawing into the plan of care for each child specialists, in a number of fields, all working as a team with the fullest possible understanding of the child's handicaps and his possibilities for growth and development

The service to be established would be a part of existing State crippled children's programs Under the projected plan, all allied State agencies would be drawn into joint planning with the administrative agency, so that when help is available through the schools, the welfare department, and other institutions, it can be considered

TRIAL BY DEPRESSION

All too familiar is the boom-crash-boom pattern Less familiar is the close tie between economic depression and public susceptibility to

compulsory sickness insurance

People under financial stress are traditionally receptive to government aid The early days of the Roosevelt Administration, with its farflung CCC and WPA, illustrate how quickly government can step into the breach when the people want it to Economic hardship creates a public mood for state medicine—and for the political candidates who prom-

It seems reasonable to suppose, then, that the next depression will constitute an acid test for private

medicine

Before stocks tumble and belts tighten, an answer must be found to the public demand for wider distribution of medical care and for spacing its cost. Voluntary health insurance must be extended to the more than 1,000 US counties not now covered by any medical society plan. Prepaid medical care must be sold to a substantial proportion of the 95 million eligible persons not now enrolled

Preventive medicine, public health, child care, and medical research all need expansion. Nor can

we blink the trouble spots in our system

Unless medicine in rural communities and in mining districts, for example, is revitalized, physicians can expect these areas to turn into depression for state medicine hotbeds A fuel to can be counted onto add flame

The constructive planks in medicine's platform are well known Not enough attention has been paid to the deadline for nailing these planks into place

When will the next depression come? It's anyone's guess But the slump usually arrives sooner

than the experts predict To fortify our system of private medical care before the country's economy takes its next header is only good sense

Our trial by depression is now in the making -

H SHERIDAN BAKETEL, M D March MedicalEconomics, -Editorial, 1947

BACTERIOLOGIC DATA REGARDING THE TREATMENT OF A TYPHOID CARRIER WITH STREPTOMYCIN

HELEN SCHWARZKOPF, Brooklyn New York

(From the Department of Laboratories St. John's Hospital, Brooklyn)

THE following study of antibiotic effects of streptomycin on the typhoid bacillus in vivo and in vitro had been made on a 62-year-old white woman submitted to the hospital for cholecystectomy The patient had the history of boing a typhoid carrier for twenty-eight years.

The bacteriologic work on this case consisted in confirming the diagnosis and in studying the effect of streptomycin on the flora of the stool of the bile, of the biliary calcula and the gallbladder of the pa tient. Additional tests on the action of the chemical were carried out in vitro with Eberthella typhosa isolated from the patient, and also for comparison with two other organisms Escherichia coli and Pseudomonas pyocyaneus.

The diagnosis "typhoid carrier was confirmed by examining the blood of the patient by means of the Widal test and by isolating the typhoid organism from the patient's stool and bile The Widal test showed the presence of specific typhoid fever anti-bodies with both typhoid antigens. The O antigen gave a 4 plus agglutination in a dilution of 1 20 and only a 1 plus agglutination in a dilution of 1 40 The 'H' antigen agglutination reached the final titer in a dilution of 1 800

The isolation of the organism was carried out by planting a measure of stool and bile specimen di-

rectly on Endo s and Salmonella shigella agar plates. The first stool specimen grew many colonies suspicious of being L typhosa together with Each coli colonies in predominance On the Endo plate the colonies appeared colorless and of a vine leaf shape, the colonies on the SS agar were round, smooth colonies with black centers caused by hydrogen sulfide production. Several of these suspicious colonies were isolated and diagnosed by agglutina tion and also by sugar fermentation tests as E typhosa. The agglutination reached a titer of 1 2,500 with a 4 plus agglutination and 1 10 000 with a 1 plus agglutination. An additional serologic test was made by exposing the isolated typhoid organism from the patient against the patient serim. It showed a positive agglutination in a serim dilution of 1 1000

The bile specimen was also found positive a small loop of it directly plated on Endo's and SS agar yielded several colonies of E. typhosa.

The kidneys of the patient were not infected and

the urine was sterile.

After the diagnosis was confirmed, the patient received streptomycin therapy In the course of the treatment the effect of this chemical on the patient s intestinal flora was studied by daily stool

cultures. Streptomycin first attacked the coli organism which disappeared almost completely on the third day after 9 900 000 micrograms of streptomycin had been administered. The gram positive flora also disappeared at this time But the typhoid organism unexpectedly spread over the entire plate in considerably increased numbers. These colonies were dissociated into smooth and rough types with the rough types predominating However from the fifth day on, after the patient had received 12,-000 000 micrograms of streptomycin a gradual decrease in the number of typhoid colonies took place, and their morphology became increasingly abnormal On the eighth day after the administration of 23 000 000 micrograms of streptomyon a few color less colonies of questionable morphology still could be detected on Endo s agar They were of granular character relatively large and flatter, their surfaces were more irregular more effuse with irregular edges. It was also impossible to recognize them by their chemical reaction since they did not produce hydrogen sulfide on SS agar on Kligler's iron agar or lead acctate. They could only be diagnosed as E typhosa by aggluthation tests. Now their titer reached only a dilution of 1 500 These atypical organisms were moculated into the peritoncal cavity of a guinea pig and were found to be nonvirulent.

However the stools continued to be positive for the following two weeks showing one to three stypical colonies of E. typhosa. On the fifteenth day, after 40 000 000 micrograms of streptomycin had been administered the stool was found negative for the first time

On the tenth day of treatment, after 29 700 000 micrograms of streptomycin had been given, a bile specimen was investigated. The direct cultures of the drained bile were negative but several colonies of E. typhosa were found after the scienite-F enrichment method was applied for the process of culturing, for which the large amount of 8 cc. of bile was used for seeding 25 cc. of selenite medium

The bile and also the urine of the patient were briefly examined for their antibiotic powers in order to determine if they carried streptomycin. Both specimens were tested against a fresh virulent typhold culture by placing drops of bile and urine on plates heavily seeded with typhoid organisms, The bile showed very little inhibition of the typhoid growth under its drops, whereas the urine inhibited the growth not only under the urine drops but also in an extensive surrounding sone. These findings are in agreement with Zintel et al. 1 who have shown that after the parenteral injection of streptomycin the chief route of excre ion was through the urinary The concentration in the bile and excretion through the biliary tract was appreciably less. The highest concentration of the chemical was found in the blood.

Because of the continued presence of typhoid bacilli in the bile the calculosis and the probability that the gallbladder was a focus of infection a cholecystectomy was performed after fifteen days

The streptomycin for this tudy was made available through the courtesy of Charles Pitter and Company Brook 19n, New Jork.

The auth r winless to express appreciation to Dr E. J Grace Brooklyn, New York for the suggestion of these studies and the opportunity to make these observations, and also to Dr Haymond Cettinger, Director of the Department of Laboratories St. John Brosphi | Brooklyn New York for his helpful interest in this work.

of chemotherapy, using a total amount of 41,-000,000 micrograms of streptomycin of which 38,-200,000 micrograms were given intramuscularly

and 2,800,000 micrograms orally

The gallbladder was reported as showing the features of chronic cholecystitis. It contained many calculi consisting chiefly of calcium bilirubinate and mixed cholesterol types. A few representative calculi were sterilized from the outside, smashed under sterile precautions, and planted on Endo's and SS agar plates. These cultures grew countless E typhosa colonies of typical cultural, morphologic, and physiologic characteristics. Also, tissue taken from the gallbladder wall and also from its mucous membrane developed a heavy growth of E typhosa suggesting that the streptomycin did not penetrate the deeper layers of the gallbladder nor the smallest calculi. Cultures from the drained bile again yielded only a few colonies when the primary enrichment selenite-F culturing method was used.

Two hours after the operation, a specimen of vomitus containing bile was received for investiga-

tion, it contained countless typhoid bacilli

The streptomycin treatment of the patient was resumed after the operation and a total amount of 42,000,000 micrograms was given The patient also received acidophilus milk as part of the diet, in order to establish the acidophilus bacillus in the intestinal flora Daily cultures showed degenerated typhoid colonies in slowly decreasing numbers with the acidophilus bacillus gradually predominating Eleven days after the operation, the stool was free of E typhosa Four days later, additional stool cultures were examined on three successive days, which also remained negative A final check-up was made two months after cholecystectomy and both the bile and the stool were found to be negative by our laboratory and the Department of Health

Tests in Vitro

The antibiotic properties of the streptomycin were also tested out in vitro against the typhoid organism isolated from the patient. Broth cultures with tubes containing from 1 to 200 micrograms of streptomycin per cubic centimeter of medium were seeded with equal amounts of bacilli. The results are given in the table in column 2

Broth containing 100 micrograms of streptomycin per cc of medium showed marked retardation and reduction of growth which became evident after incubation of ninety-six hours or after transplants were made into fresh media, incubated for at least forty-eight hours Broth containing 200 micrograms of streptomycin per cc of medium remained sterile, even when repeatedly transferred and incubated for the long period of 168 hours

Comparative Tests

For comparison, the antibiotic action of different amounts of streptomycin was briefly studied on the following organisms. Esch coli, E typhosa, and P pyocyaneus. For this purpose agar plates with different amounts of streptomycin were seeded with these three organisms. Plates having a concentration of 2.5 micrograms of streptomycin per cubic centimeter of agar showed some inhibition of Esch coli, no effect on E typhosa, and no effect on P pyocyaneus. On a similar plate with 10 micrograms of streptomycin complete inhibition of Esch coli,

marked inhibition of E typhosa, and no effect on P pyocyaneus was obtained, 100 to 200 micrograms of streptomycin per cubic centimeter of agar showed complete inhibition of Esch coli and E typhosa, but no inhibition of P pyocyaneus Complete inhibition of all the three organisms occurred on the plate having a concentration of 500 micrograms of streptomycin per cubic centimeter of medium. In all these tests, the plates were incubated for one week.

Summary

The preparation of a typhoid carrier for cholecystectomy by the preoperative therapy of streptomycin offered an opportunity to study some of the effects of this antibiotic on E typhosa clinically and in vitro

Before the removal of the gallbladder, 40,000,000 micrograms of streptomycin were administered, of which 38,200,000 micrograms were given intramuscularly and 2,800,000 micrograms given orally

The antibiotic effect of the streptomycin on E typhosa was evident in a conspicuous reduction of the number of colonies cultured from the stool, by their changes in morphology and by the biologic reaction of the organism. Although the stool was negal fee on one occasion, before cholecystectomy, subsequent stool specimens again contained typhoid bacilli. These observations indicate the need for continued cultures.

The drained bile before the operation and the bile from the removed gallbladder were positive, but both specimens required the selenite-F enrichment method to demonstrate the organism which was di rectly and readily cultured in large numbers from the calcult the gallbladder wall, and the mucous membrane suggesting that the streptomycin did not penetrate the deeper layers of the gallbladder in sufficient quantity to have significant antibiotic effects.

Antibiotic effects on E, typhosa were demon-

strated in vitro by using the patient's bile and urine and also by the reactions compared which were produced by various concentrations of streptomycin with E typhosa, Each coli and P pyocyaneus,

THE OPPORTUNITY

June 1, 1947]

Tuberculosis, which remains a major health problem all over the world has been under concentrated attack in this country for over forty years greatest effort ever made to emdicate tuberculosis in livestock in the United States was begun about 1900 The result is that today the milk we drink comes from tuberculosis-free dairy herds and our meat comes from nontuberculous animals.

Viewed from the standpoint of all humanity this remarkable achievement is little more than an impregnably secured beachhead, but for Americans it has meant almost complete elimination of all human forms of bovine tuberculosis (largely tuberculosis of the bones) Ultimately other countries must also

reduce animal tuberculosis.

Today, hospitals are participating in the greatest direct effort ever made to eradicate tuberculosis in humans. This movement began rather slowly about twenty or twenty five years ago with tuberculin testing programs for selected groups This was accompanied by construction of numerous sanatoriums to care for discovered cases. Soon it was learned that physical diagnosis would not discover early cases, but that the x ray could There has been real progress National tuberculosis mortality rates have declined and some areas have achieved mortality lows which were not considered possible forty years

Despite all this, it was not until about ten years ago that the prospect of complete eradication became a foresceable probability The earlier programs, depending on tuberculin testing, physical diagnosis, and limited use of the x-ray were too cumbersome and expensive for universal coverage and diagnosis of cases in their early stages. These handicaps were overcome by the development of photofluorographic x ray equipment and there now appears to be justifiable optimism toward the prob-

lem of tuberculosis eradication

The Council on Professional Practice of the Amer ican Hospital Association believes that the immedi ate need is to extend the practice of routinely x raying chests. This should be done in many different population groups but the council is, of course primarily concerned with the hospital program. A

few statistics and facts may be worth repeating Hospital admissions now exceed 16,000 000 a There are other undetermined millions who are seen in outpatient clinics These two groups lend themselves to routine radiography thermore many of these persons would not be reached by programs directed at industrial or other population groups.

Two years ago the Council surveyed all hospitals to determine the extent of routine radiography 104 hospitals reporting programs, further checking suggests that only a moderate per cent had a routine considered adequate today. On the other hand a few weeks ago at a regional hospital meeting a dozen or more administrators indicated their hospitals are now x raying chests routinely In one state two photofluorographic units have been purchased by local tuberculosis associations and placed in hospitals and four more are on order, or have had funds earmarked for the purpose The U.S. Public Health Service has approved or will approve, funds for state and local health departments with which to place several hundred x-ray units in hospitals \ \lany nospitals are setting up the programs on their own or other resources

The institution of case-finding routine radiography by hospitals, however will bring general hospitals face to face with the necessity of providing facilities for temporary handling of some of the discovered

Routine chest vaying should not be deferred simply because of the fact that cases of tuberculosis will be discovered These patients are in hospitals for other reasons in the first place Failure to discover tuberculosis results in these undiagnosed cases of tuberculous exposing other patients and employees to tuberculosis Until new construction permits adequate care for tuberculosis itself, hospitals should be able, with the ald of the manual. The Management of Tuberculosis in Hospitals, to accept with safety tuberculosis patients for non tuberculosis treatment

Human tuberculosis is under the most severe attack ever directed at it. The best thinking today appears to be that eradication will be achieved only after a long pull that more intensive dis-covery programs will continue to increase the known cases for years to come, that the sensible course is to create the programs and facilities necessary now to maximum discovery and adequate treatment.

Many national state and local organizations are coordinating their efforts to eliminate this disease The hospital has a dominant part in the program. It can become a major case-finding agency by routinely x raying the cheets of all nation to on admission all outpatients and all employees.—Robin C Buerki M D Hospitals August 1946 in Tuberculous Abstructs April, 1947

ASPHYXIA SECONDARY TO AORTIC ANEURYSM

Bernard J Ficarra, M D, Brooklyn, New York

THE present day accentuation of syphilitic infection has been determined as fection has brought to light an increasing number of patients with aortic aneurysm Spirochetes seem to have a selective affinity for the arch of the aorta, where it causes a weakening of the wall Local weakness leads to dilatation and eventual aneurysm formation Often the pressure of the blood in the aorta causes an out-pocketing in the form of a saccular aneurysm A blood clot may form laminations filling the aneurysm, thus producing a spontaneous cure

Clinical and pathologic literature on aneurysms fail to report any instance of asphyvia due to aortic aneurysms For this reason, the following case

history is considered significantly valuable

Case Report

The patient was a middle-aged, colored man who went to the hospital on October 21 and expired on November 1 His chief complaint was one of dyspnea and a brassy cough of one year's duration At that time he experienced difficulty in breathing Slowly, over a period of many months he developed a harsh cough without the production of sputum During this time he was treated by his family physician without success. Within the three months prior to admission he was unable to work about that time he noted that the veins in his neck and arms had become very prominent His past history failed to clicit any severe illnesses However, during the course of his present illness he had

lost about forty pounds

Physical examination at the time of admission revealed a well-developed, well-nourished, middleaged colored man, apparently in acute respiratory distress. His breathing was labored with harsh respiratory and expiratory sounds A frequent brassy cough was present Tortuous verns were noted over his head, neck, arms, and chest Aside from this, examination of the head and neck were nonrevealing, excepting for inequality of the pupils and the fact that the trachea was deviated from the No lymphadenopathy was noted amination of the chest demonstrated an area of flatness over the manubrium about the size of a grape-Percussion of the chest further brought to light dullness in the left apex Tractile fremitus was not impaired Numerous crepitant and subcrepitant rales were heard throughout the left Examination of the heart revealed it to be enlarged downward and to the left No murmurs were audible The rate was 160 The remainder of the physical examination was negative impression at the time of admission was a mediastinal tumor, the possibilities of which were a dermoid cyst, Hodgkin's disease, or other lymphoma.

substernal goiter, or aneury sm On October 23 an x-ray study revealed a welldefined mass filling the entire mediastinum and extending into the upper lung field. The aorta was tending into the upper lung field. The aorta markedly displaced downward and to the left blood Wassermann test was taken which was reported as four plus This brought about further interrogation as to luetle infection. The patient stated that his wife had one miscarriage in the first trimester of pregnancy In view of the additional information, fluoroscopic examination was performed This study failed to demonstrate adequate pulsation in the region of the aorta which would indicate the presence of an aneurysm Kymographic studies were contemplated in order to assist in the diagnosis of an aneurysm A biopsy was suggested of the mediastinal mass However, the patient's extreme orthopnea prevented such a procedure On November 1 respiratory distress became so marked that continuous oxygen was necessary pirations at this time were shallow and labored

Laryngoscopic studies showed that the epiglottis was very small and pinched upon itself. The in terior larynx was not visualized With much difficulty the vocal cords were seen, there was no growth or ulceration noted. The right cord showed only partial motion toward the midline The left cord was not impaired The entire laryns and tracheal structures were pushed far posteriorly was considered adequate so that a tracheotomy was not necessary. The consultant stated that the findings were compatible with mediastinal or vascu-lar tumor. X-rays were again taken. The report stated that there was a large supra-aortic and paratracheal mass extending to the periphery of the upper third of the right lung field This mass was stated to appear in close association with the aortic arch and could not be separated from it studies were contemplated to determine whether the findings were the result of a vascular tumor such as an aneurysm or a large mediastinal growth November 1 the patient expired in the afternoon from what was diagnosed as cerebral anovia The patient's temperature during his hospitalization ranged between 98 6 F to 100 F His respirations were always irregular and rapid, pulse rate was 160 The blood pressure in both right and left arms was 110/100

Laboratory Data — Total proteins 48, blood chemistry urea-29, creatinine-12, sugar-76, blood Wassermann four plus, stool for blood was negative, urine was negative except for 5 to 8 white blood cells in clumps, white blood count—9,640 with 7 per cent eosinophils, hemoglobin—90 per cent, red blood count—4,200,000 The electromagnetic cent. cardiogram demonstrated myocardial damage and left ventricular hypertrophy

The patient was autopsied the day following his The significant findings were as follows

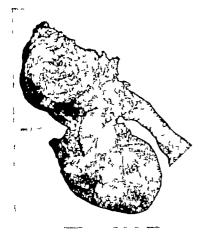

Marked clubbing of the fingers of the left hand was noted

Distention of the veins noted clinically was 2

confirmed

Inspection of the thoracic cavity showed a very large, round, symmetrical mass emanating from the ascending aorta and protruding into the right The mass measured 8 cm in diamepleural cavity The mass was moderately firm in consistency ter but could be compressed

The mass arose one inch from the aortic ring The wall of the aneurysm and was a true aneurysm was about one meh in thickness and in some areas was one and one-half inches The superior portion

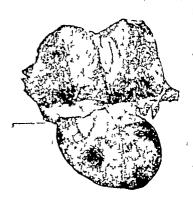

Fig. 2 Ansuryon opened revealing almost complete occlusion of acritic lumen

of the walls of the ancuryam were soft in consistence. When the ancuryam was opened the structure was very frable and broke. The appearance of this area was of three distinct layers which formed a well-organised blood clot. The adventitin, media, and intima could be identified grossly. The media was laminated in appearance friable and soft in consistency (see Figs. 1 and 2).

5 The heart was tremendously dilated weighing about 500 Gm. without the anourysm. Marked hyportrophy of the ventrules was noted. All the

valves were competent.

6. The aortic mass extended posteriorly and compressed the trachea almost completely. How ever a small airway still remained. The tumor mass compressed the right lung so that the lunor parenchyma was poorly aerated. The right pulmonary apex had many adhesions more marked in the region of the aortic mass. Section of the lung demonstrated bronchiectaria. The remainder of the autopsy was nonportinent.

7 The cause of death was asphyxia secondary

to acrtic ancuryem.

Comment

Clinical features of this case in many aspects are classic of aortic ancuryam. The inequality of the pupils resulted from compression of the sympathetic chain. Pulmonary signs were attributed to trach eal and bronchial compression which produced bronchiectasis. Bronchiectasis of this type simulates tuberculosis hence the term ancuryamal phthisis. The positive serology was significant.

The unusual clinical findings were the inability to demonstrate an expansile mediastinal mass which is pathognomonic of aneruyam Fluoroscopy and ky mography did not reveal a pulsating tumor The reason for this was demonstrated adequately at antopys. The ancary-mai pathology resulting in the formation of many laminae gradually diminished the lumen of the aorta. This process insidiously impaired cardiac output, even as the laminae solidified the aorta. This solidification provented the true clinical identification of the lesion.

More unusual was the compression of the traches by the aneurysm. The compression gradually dr minished the pathway of gaseous exchange was a prime factor in the interference with adequate respiratory function. Thus, oxygen intake was diminished and carbon dioxide retention gradually increased In the presence of this situation, anoxic anoxia resulted Moreover the gradual diminution of the size of the aortic lumen lessened the volume of blood available for aeration. Under this cir. cumstance, ischemic anoxia was added to the previously existing anoxic anoxia. Both these factors resulted in the clinical signs of orthopnen and dyapnes which finally produced cerebral anoxia and death from a phyxia

Summary and Conclusions

of luctic origin

- A report is presented of asphyxia recondary to sortic aneurysm
- to aortic aneuryam
 2. Clinical studies demonstrated several features
- typical of aneurysm and others alien to this leanon
 3. Autopey revealed the sorts to be almost completely obliterated by a large laminated aneurysm
- 4 Tracheal compression was almost complete, due to pressure of the aneury sm.
- 5 Insidious death was attributed to asphyxia resulting from chronic ischemic and anoxic anoxia.

REITER'S DISEASE—REPORT OF A CASE SUCCESSFULLY TREATED

JACOB D MATIS, M D, New York City*

SINCE its description by Reiter in 1916, the syndrome of urethritis, conjunctivitis, and arthritis has been observed by a number of authors a total of some 60-odd cases have been reported and the recent trend seems to be to recognize the disease more frequently 2 Reiter's disease is almost always seen in young men, especially among those in mili-The author has seen several cases tary service during his military career, and since one symptom of the disease predominates, these cases were usually first seen on the orthopedic, eye, or genitourinary services of an Army hospital The specialists on these services were concerned with the predommating symptom and were usually not cognizant of the triad which would allow the diagnosis of Reiter's disease

The urethritis of Reiter's disease resembles gonorrheal infection except for the absence of specific organisms after repeated attempts at smear and There often is an accompanying cystitis which may be the most troublesome symptom Involvement of other parts of the urmary tract has been reported.3 The conjunctivitis starts in one eye, but soon becomes bilateral, it is acute in onset and the discharge is purulent 4 There is usually spontaneous recovery without impairment of vision All attempts to recover a specific organism from cultures of the exudate have been negative

Arthritis is the most chronic and incapacitating symptom of the triad. Polyarthritis is the rule. and in the author's experience the knees have been most frequently involved The pain is severe and the patient is confined to bed for a total of one to five months with periods of remission and exacerba-Some few cases of permanent joint injury have been reported since the first report of a case of Reiter's disease in the American literature by Bauer and Engleman 5

French authors have always noted diarrhea preceding the other manifestations of Reiter's disease While some American authors7 have also reported diarrhea early in the disease, it is not a necessary part of the clinical picture. In my experience, diarrhea was neither a frequent nor a severesymptom A definite order of appearance of the triad of symptoms has been reported and, while urethritis is commonly the earliest symptom, patients often present themselves with other complaints Laboratory studies show moderate leukocytosis, rapid sedimentation rate, negative blood cultures, negative urine and serologic findings, and negative bacteriologic studies of the conjunctival evudate, urethral discharge, and joint fluid

Various drugs have been tried in the treatment of Reiter's disease without success 22 Large doses

of penicillin and sulfonamide drugs, alone and in

* Formerly lieutenant colonel, MC, Chief of Medical Service, 227 General Hospital, APO 772

combination, have been tried by the author and others without response A recent report by Strachstein tells of a case of Reiter's disease treated successfully by means of fever therapy knowing of this work, the author used fever therapy in several cases, resorting to intravenous typhoid vaccine rather than intragluteal milk injection as Strachstein did While our results have been universally good, they have not been as brilliant as Strachstein's, possibly because our cases were of a more chronic nature when first seen and treated Since the patients were treated in an overseas military hospital and were later evacuated to the Zone of the Interior, they could not be followed for long periods after therapy The results were dramatic enough, however, so that the improvement may be said truly to be due to therapy rather than the possibility of remission of the disease

Case Report

The following case of Reiter's disease is reported since it is the most chronic and disabling one in my experience

A 21-year-old white soldier was admitted to the Eye Section of the 227th General Hospital in France on December 11, 1945, because of conjunctivitis of the right eye of four days' duration. On the day of admission the left eye became involved day the left knee became swollen, painful, and warm, and on the following day the left elbow and left On the fourth shoulder were similarly involved hospital day there was a moderate urethral discharge which lasted one day and was negative on There was no history of recent smear and culture sexual exposure Laboratory studies on admission showed a white blood count of 10 100 with 70 per cent polymorphonuclears, red blood count of 3,700,000, hemoglobin, 12 2 Gm, and sedimentation Urmalysis and Kahn test were negative rate, 31 Physical examination was negative except for the X-rays of the swollen joints and conjunctivitis chest and involved joints and electrocardiographic studies were all negative Penicillin, sulfadiazine and salicylates were without effect on the painful joints and temperature, which remained between 99 and 101 F

On December 17, 20 cc of turbid fluid was aspirated from the left knee, smears and culture of the fluid were reported as negative for organisms Repeated examinations of the eye exudate had also

been negative The conjunctivitis improved gradually and spontaneously, so that by January 30 1946, six weeks after admission, only the painful and swollen left knee, left elbow, and left shoulder remained un-The patient was confined to bed throughout this period and a great deal of muscle wasting of the left upper and left lower extremities was no-At this time the sedimentation rate was 35 and the white blood count 10,750 with 80 per cent It was now decided to use polymorphonuclears fever therapy since there had been no improvement

in the patient's polyarthritis in the six weeks of hospitalization and also since fever therapy had been used on our service with success in previous cases of Reiter a disease. Twelve and a half million killed typhoid organisms were injected intravenously on January 31 and there was a rise in temperature to 102 F for several bours. On February 5 75 000 000 organisms were given in a slow intravenous drip and a temperature of 102 F to 103 2 F was sustained for over four hours. During this period sulfadiaxine and penicillin were administered con comitantly

Within four days after the treatment there was the first marked improvement in the patient s condition. Motion of the affected jounts was no longer restricted by pain and almost all swelling had subsided. Active motion of the joints was encouraged and the patient was ordered out of bed. The patient was now afebrile and improvement in joint motion continued so that by February 20 the patient was well enough to be excusted to the Zone of the Interior for further care. At this time only slight swelling of the left knee remained and the problem then was that of muscle conditioning to overcome the muscle

wasting which had occurred during the long period of immobilization due to joint pain.

Summary

- 1 The triad of symptoms consisting of urethritis, arthritis, and conjunctivitis, all of nonspecific cause, has been described as Reliter's disease.
- 2 A case of Renter's disease is presented to illustrate its typical course and to point out a gratifying response to fever therapy

CITRIC ACID SYNTHESIS IN HUMAN SUBJECTS

Citric and synthesis has been demonstrated in the animal body by C C Sherman, L. B Mendel, and A. H Smuth (J Biol. Chem. 113 247 (1936)) Similar observations in human subjects have been found by J E. Strom and M. L. Hathaway (J Vutrition 32 327 (1946)) These workers compared the urnary citric and exerction of 3 subjects fed a purified diet containing no citrates with the citric acid exerction of the same subjects when fed a natural-food diet which supplied an average of 197 mg of citric acid per day Since C C Sherman, L. B Mendel, and A. H. Smith (J Biol. Chem. 113 265 (1936)) had shown that animals excreted small and relatively constant amounts of citric acid in their feces in ofscal analyses for citrates were made in the present experiments

When the subjects were fed the purified diet for a period of forty fivo days the daily citric acid excretion was observed to vary from \$63 to 1179 mg, for subject A, from 673 to 994 mg for subject B and from 487 to 1019 mg, for subject C When the natural food diet was fed for a period of twenty-one days, the daily citric acid excretion of the 3 subjects was found to vary within the same range observed when the purified diet was fed. The citrates ingested in the natural food diet had not influenced the citric acid excretion Individual variations in daily citric acid excretion of the same magnitude were observed on the two diets. During the forty

five day period of maintenance on the citrate-free purified diet, the subjects excreted a total of 38, 39 and 34 g. of citric acid, respectively. The authors calculated that at the beginning of the experiment the subjects had citric acid stores in their skeletal structures of roughly 43, 45 and 47 g., respectively. No decline was observed in citric acid excretion toward the end of the forty five day period even though the amounts of citric acid excreted were equivalent to 70 to 90 per cent of the calculated citric acid stores. In addition no increase in calcum excretion was observed during the entire experimental period.

Since citric acid and calcium are believed to be intimately associated in bone, these data are strong ordence that citric acid synthesis does occur in human tissues when a ration containing no citrates is fed

An interesting relationship was observed between the citrate excretion and the phase of the menstrual cycle. In each subject the highest excretions occurred during the mid period of the cycle and the lowest excretions during menstruation. This represents confirming evidence for the relation of urinary citric acid exerction to the menstrual cycle and the steroidal reproduction hormones described by E. Shorr A. R. Bernheim, and H. Taussky (Science 95 606 (1942)) —Nutrition Reviews March 1947

THE PRESENT STATUS OF STREPTOMYCIN

JOHN WINSLOW HIRSHFELD, M D, Ithaca, New York, and CHARLES W BUGGS, PH D, Detroit, Michigan

(From the Department of Clinical and Preventive Medicine, Cornell University, Ithaca, the Division of Surgery, Tompkins County Memorial Hospital, Ithaca, New York, and the Department of Bacteriology, Wayne University, Detroit, Michigan)

HE extraordinary success of penicillin in 1 the treatment of certain bacterial infections led to a search for other antibiotic agents with which to attack bacteria that are resistant to In January of 1944, Schatz, Bugne, penicillin and Waksman1 announced the isolation of such an agent and named it streptomycin from the generic name of the organism that produces it, namely. Streptomyces griseus, a soil actino-This agent was shown to possess a powerful antibiotic action both within and without the body, against not only gram-positive bacteria but also against gram-negative bacteria,2-9 and it quickly became apparent that it was sufficiently nontoxic and valuable in the treatment of certain infections in animals to warrant an extensive clinical trial Considerable progress has been made in this direction, 10 and, although there are many issues which have not been settled, enough data have been accumulated to warrant an appraisal of the current status of this new antibiotic

Preparation of Streptomycin for Use and Standardization

Streptomycin is supplied as streptomycin hydrochloride or streptomycin sulfate preparations are in powder form and are readily soluble in water or in physiologic salt solution Waksman¹¹ has proposed an "S," "L," and "G" unit,* but current practice is establishing the administration of the agent in terms of fractions of a gram every three or four hours and not in The antibacterial activity of one terms of units microgram (0 000001 Gm symbolized by the Greek letter gamma) of the pure base of streptomycin is equal to one "S" unit, but because the individual dose of streptomycin required to treat a given case is usually in terms of hundreds of thousands of units, it is better that dosage be expressed in grams Bacterial sensitivities are given in terms of gammas or micrograms

Compared with penicillin, streptomycin on the weight basis is considerably less effective. Fifteen milligrams of crystalline penicillin, equivalent to about 25,000 units, is considered a good therapeutic dose, whereas effective doses of streptomycin for the majority of infections caused by gram-negative bacilli begin at 125 mg. Because many bacteria quickly become streptomycin-fast, it is important to administer large doses, and 400 to 500 milligrams (0 4 to 0 5 Gm.) of the agent every three or four hours is a better dose than smaller quantities

The Bacterial Spectrum of Streptomycin

The cardinal principle in antibiotic therapy is undoubtedly that the invading micro-organism be sensitive to the antibiotic employed, and for rational therapy some knowledge should be possessed of the amount of antibiotic needed to inhibit the growth of bacteria and the blood levels attainable with various-sized doses majority of the bacterial species that affect man have been tested in vitro for their sensitivity to streptomycin 12-16 Workers in this field support the viewpoint that infections caused by many of these organisms can be brought under control provided (1) the organism is clinically sensitive to streptomycin, and (2) is eliminated before it has developed a resistance to the agent "clinically sensitive" it is meant that the organism's growth can be prevented by concentrations of streptomycin obtainable within the body This distinction is necessary, as it has been found that, within the body, a streptomycin concentration from four to eight times greater than the in vitro sensitivity of the invading bac-Such blood teria is required to effect a cure levels are not difficult to maintain if the in vitro sensitivities are of a high order, that is, if the organism is sensitive to a minimum of not more than about 5 micrograms Thus, Alexander¹⁷ has found clinical response to be closely correlated with the sensitivity of the invading organ-Infections caused by organisms with high in vitro sensitivities usually respond favorably, whereas those with low sensitivities are usually refractory to treatment

^{* &#}x27;S'' unit That amount of streptomycin which will inhibit the growth of a given strain of the colon bacillus in 1 oc of nutrient broth or other suitable medium. It is equivalent to 1 coli unit L' unit. One thousand 8 units G'' unit One million 8' units equivalent to 1 Gm of crystalline streptomycin with an activity of 1,000 coli units per milhgram

The Development of Resistance to Streptomycin by Bacteria

Of considerable importance is the ability of many bacteria to develop a resistance to streptomycin with considerable rapidity. This has been demonstrated both in vitro and in vivo studied thirteen strains of bacteria commonly found in infections of the urinary tract. She was able, by growing these organisms in increasing concentrations of streptomycin to raise the resistance of all of them to 1 000 micrograms per cc of culture medium. It required a maximum of twelve subcultures in broth or twenty four in urne to produce this high resistance and Bohnhoff! were able to increase the resistance of six strains of gonococci and ninety-six strains of meningococci from levels of 1 to 40 micrograms to a point where they grew in the presence of 75 000 micrograms of streptomycin This increased resistance was acquired in from four to six transfers The virulence of the organisms was not affected when they became streptomycin-fast.

Youmans et al 29 found that tubercle bacilli isolated from 7 patients under treatment with streptomycin had increased in resistance from 500 to 1,000 times that possessed by the organ isms before therapy was begun In a study of streptomycin resistance of bacteria isolated from patients with various types of surmeal infections, Buggs et al 14 found that streptomyon resistance was often rapidly acquired in patients who were undergoing therapy More recently, the follow ing rapid in vivo adaptation of bacteria to streptomycin has been observed A colon bacillus isolated from a bacteremia before streptomycin therapy was begun was found to be sensitive to 8 micrograms of the antibiotic When streptomycin therapy was instituted the organism im mediately disappeared from the blood stream but reappeared six days later with a resistance greater than 20 000 micrograms of streptomycin per co. of culture medium A strain of Proteus vul garis and an alpha hemolytic streptococcus were also isolated from the blood stream of this pa tient Both organisms rapidly adapted them selves to the streptomycin so that after a few days exposure they were able to grow in the presence of more than 20 000 micrograms of the Although this patient received 0.5 Gm of streptomycin every four hours it is apparent that the streptomycin in his blood stream was insufficient to prevent the multiplication of the organisms which were in some focus of infection and, hence they became resistant to its action

Finland and his associates in have recently reported streptomycin failures due to acquired bacterial resistance in 8 patients infected with

gram-negative bacilli On a basis of their blood level and sensitivity studies, 3 of these patients were certainly adequately treated, for the blood level values were from four to eight times higher than the in vitro sensitivities of the invading During therapy, however, organisms from all 8 cases reported developed resistances greater than 50,000 micrograms of streptomycin per cc of culture fluid An interesting specula tion is the outcome of these cases had the in vitro sensitivities of the invading bacteria been from 2 to 5 micrograms of streptomycin instead of from 6.3 to 100 micrograms. The infecting or ganism in one of the 8 cases Hemophilus influenzae, had an unitial sensitivity of 16 micrograms but blood level determinations were not reported

The implications of these facts are obvious. Since bacteria can acquire resistance to streptomyein rapidly treatment must not be instituted with small doses. On the contrary, it is important to begin treatment with imassive doses and to eliminate the invading organisms as completely and as quickly as possible. Also before therapy is begun it is essential to eliminate indwelling catheters renal calculi, drains bone sequestra and poorly drained sinuses which protect bacteria and may give them an opportunity to become resistant.

The Determination of Streptomycin in Body Fluids

Because of the relatively large concentrations of streptomycin that appear in the blood, and other body fluids following parenteral administration, it is feasible to employ the cup plate method for assaying body fluids. The method of Stebbins and Robinson²² has given, on the whole, consistent results and is to be recommended. Other methods and modifications of the cup plate method have been advanced. The consistence of the cup plate method have been advanced.

Absorption, Distribution, and Excretion of Streptomycin

The absorption, distribution, and excretion of streptomycin has been studied and reported upon by a number of investigators n-14. The various data are in good agreement. Thus, the literature is unanimous in pointing out that streptomycin when administered orally is only sparingly absorbed and detectable amounts usually do not appear in the blood. This failure of absorption is not, however due to destruction in the gastrointestinal tract, as almost 100 per cent of the quantity given by mouth is excreted unchanged in the stools.

Following parenteral injection streptomycin is rapidly absorbed and distributed throughout

most of the body fluids. It has been assayed in blood, ascitic fluid, pleural and peritoneal fluids, aqueous and vitreous humors, amniotic fluid and bile. It also passes the placental barrier and can be detected in cord blood ⁵⁷. Only small amounts of the agent appear in cerebrospinal fluid of healthy individuals following parenteral administration, but apparently in the presence of meningitis larger, though not therapeutic, amounts enter. Streptomycin injected directly into the subarachnoid space remains there for some time and can be detected in therapeutic concentrations in cerebrospinal fluid at the end of twenty-four hours.

The chief mode of excretion of streptomycin is by the kidneys, and as much as 92 per cent of an injected dose may be recovered in urine. Urine concentrations may amount to more than 1,000 micrograms. Although streptomycin is also excreted in bile, the liver does not appear to concentrate it to any great extent.

In contrast to penicillin, streptomycin, when administered by nebulization, is poorly absorbed and detectable quantities are not found in the blood or urine 31 Streptomycin is absorbed and excreted more slowly than is penicillin, and, for this reason, blood concentrations remain at a peak for longer periods of time Ten to 18 or more micrograms are found per cc of serum for from two to four hours following a single intramuscular or intravenous dose of 0.5 Gm concentrations of 4 to 6 micrograms may persist for six and, occasionally, for twelve hours following such a dose. It is to be remembered, however, that these are average values, and levels much lower and much higher are obtained from patient to patient

Toxicity of Streptomycin

All reports on toxic effects of streptomycin agree that there have been no serious or lasting reactions following its intramuscular administration over a period not exceeding two weeks A few transient reactions have been reported^{28-29 31 36 38-41} and continue to occur, but in retrospect many of them may be attributed to impurities in the preparations then available Renal and hepatic function tests have revealed no significant damage and no pathologic changes have been demonstrated in animals killed in acute toxicity experiments 41 Hinshaw, in his report to the Committee on Chemotherapeutics and Other Agents, 10 stated that one of 6 patients in his series who had come to necropsy showed evidence of renal damage, but this patient had also been treated with sulfonamides et al 40 have recently reported that the application of 5,000 micrograms of streptomycin to the

central nervous system of monkeys will induce temporary convulsive manifestations, but that these are less severe than those produced by the same unitage of penicillin Brown and Hinshaws have given an extended report of their experiences with labyrinthine disturbance in 23 patients treated with streptomycin but, in all except one. the disturbance did not occur under two weeks of treatment They concluded that "symptoms of involvement of the eighth nerve are no contraindication to administration of streptomycin in cases of serious types of tuberculosis, since compensation for loss of labyrinthine function tends to occur" The condition is seen most often in patients who receive streptomycin over long periods of time

In summary, the toxic reactions which have occurred in humans receiving streptomycin are of several varieties

- 1 Irritation and pain at the site of injection. This was more common with the earlier preparations, but it still occurs
- 2 Histamine-like reactions such as headache, flushing of the skin, fall in blood pressure, nausea, and vomiting may occur immediately after an injection of streptomycin. Arthralgia and fever may occur somewhat later. Like the local reactions, these phenomena were more frequent with the less refined preparations.
- 3 Sensitization manifestations Erythematous, urticarial, or morbilliform skin rashes and fever may appear after several days of treatment
- 4 Casts and albumin may appear in the urine Usually this is not a serious occurrence, for the urine clears, when there my is discontinued.
- clears when therapy is discontinued

 5 Toxic action on the eighth cramal nerve.
 During prolonged treatment, or even after short
 treatment with heavy doses, 42 there may develop a
 subjective sense of vertigo, accompanied by an ataxic
 gait and reduced labyrinthine response to calorio
 tests. Occasionally a transient deafness may occur,
 but this seems to be due to the primary disease
 process and not to streptomycin. No permanent
 loss of hearing of a serious nature developed in the
 cases reported by Brown and Hinshaw 33

Therapeutic Uses of Streptomycin

Streptomycin has been used in a number of infections in which the results of the early in vitro tests against bacteria indicated that it might be successful. In some types of infections the response has been striking while in others it has been disappointing

Tularemia—Gratifying results have been obtained in the treatment of tularemia with streptomycin Pasteurella tularensis is extremely sensitive to streptomycin, being completely inhibited by as little as 0.15 microgram per cc of culture medium. Heilman found that 100 per cent protection of infected mice could be obtained if they were treated with a total of 1,000

micrograms of streptomycin per day These results have been amply confirmed and extended to human cases of tularemus. There is no published evidence that P tularensis becomes resistant to streptomyou as the equally-sensitre tubercle bacillus does Tularemia, therefore, is an excellent example of a disease caused by a sensitive organism which can be promptly cured with streptomycin primarily because the organism is sensitive to the antibiotic and shows no disposition to adapt itself to the agent during therapy

Treatment has on the average consisted of 1 Gm. of streptomycin per day for the glandular type of the disease and 2 Gm daily for the pulmonary and pleural types. All reports 10 42-42 are unanimous in describing streptomy cin as a most effective agent for the treatment of tularemia, and the opinion of the Committee on Chemotherapeutics and Other Agents is that it is by

far the most effective agent available

Bacteremia Due to Gram negative Bacilli -A number of patients with bacteremia due to gram negative bacilli have been treated with streptomycin 45-40 The blood stream was promptly sterilized in all of those cases in which the organism was continuously sensitive to the concentrations of streptomy cin that could be maintained in the blood Abscesses, however, which were often the source of the bacteremia, were not sterilized and, thus, required surgical drainage. Sixty-seven per cent of 91 cases reported by Keefer et al 10 either recovered or improved while 4.4 per cent of them showed no response All of the patients who died 28 6 per cent were gravely ill when treatment was begun and death occurred between one and five days thereafter

Urinary Tract Infections - Since streptomy cin is effective against many of the bacteria which commonly cause infections of the urinary tract it was logical to suppose that it would be of value in the treatment of these infections number of workers have reported the results of such therapy 10,31 65-65 In general the results are encouraging provided (1) the organisms are senutive and do not develop a resistance to the agent, and (2) factors predisposing to infection such as urmary stasis, indwelling catheters and calcult are not present. As shown by Helm hols, Aerobacter acrogenes and Bacillus coli are the most sensitive organisms causing urmary tract infections with these organisms order of increasing resistance are Proteus am moniae, Streptococcus fecalis, and B pyocyan eus. Although in general the above order of susceptibility holds it should be emphasized that as pointed out by Buggs et al 14 there is an enormous variation in the sensitivity of different strains of the same species of organism to strepto-

This, plus the fact that bacteria acquire resistance rapidly. 11 makes it important to deter mine the quantity of streptomy cin necessary to inhibit the organism in question before therapy Adcock and Plumb 11 have suggested is started that since often the source of the bacteria is an inflammatory process in the wall of the bladder or the kidney pelvis, unnary concentration of streptomycin is not as important as tissue con centration a fact that is apt to be overlooked in view of the high concentration of streptomycin which can be obtained in the urine As strentomycin is more effective in alkaline than in acid urine sufficient alkali should be administered to raise the pH of the unne above 7.5

Infections with Friedlander & Bacillus -Heilman' carried out an experimental study of the effect of streptomycin on infections with Fried lander a bacillus in animals He found it to be very effective Morgan and Hunts and Bishop and Rasmussen⁴⁴ have reported that cases of pneumonia due to this organism responded dramatically to streptomycin. It is not unlikely, however, that resistant cases will be encountered for many of the strains isolated are not inhibited by 256 micrograms of streptomycin Finland et al 21 have found a strain of Friedlander's bacillus which developed an in vivo resistance of more than 50,000 micrograms overnight. Its initial

resistance was 6.3 micrograms.

Hemophilus Influenzae Infections -The response of patients with influental meningities to streptomyon has been good, 17 47-40 and it is probable that exceedingly gratifying results will he obtained if treatment is initiated early in the disease.

The organism has a high in vitro sensitivity (156 to 50 micrograms) but at least one strain has been shown to become resistant during therapy (increased from an initial sensitivity of 156 to a resistance of more than 5,000 micrograms in one days1) Keefer et al 19 have reported a 06 per cent climcal and bacteriologic cure in 100 patients, and improvement in 13 per cent of the cases during treatment followed by eventual recovery Streptomycin had no effect on 3 of the patients, 1 improved but relapsed and 17 died Daily dosage, on the average, was 0.5 Gm. intramuscularly and 0.00 Gm. intra thecally

Durant et al a have reported favorable results with the use of streptomy cin in treating 3 cases of pulmonary infections. The intrabronchial route alone (0 05 Gm daily) was effective in 2 of the 3 cases.

H pertussis is also quite sensitive to streptomyon and Hagarty et al 2 were able to offect 50 per cent cures in mice by treating them with daily doses of 2 mg of streptomy cin. The mean survival time of the animals that died was twentytwo days, as compared with five and five-tenth days for the controls — It would seem worthwhile, therefore, to employ streptomycin in human infections with this organism

Undulant Fever -Although in vitro studies12 indicated that streptomycin would be useful in the treatment of undulant fever, the results have Herrell and Nichols48 found not been good that the bacteremia associated with the acute phase of the disease could be held in check with streptomycin Two or 3 cases they treated had negative blood cultures after a single course of The symptomatic course of these the agent patients, however, was unaltered The third patient received three courses of streptomycin. the last following splenectomy, and six months after discharge from the hospital was afebrile In the latter instance, the spleen was found to be a focus of infection Chronic infections, in which blood cultures are negative, have not responded to streptomycin As pointed out by Spink and Hall,62 and Harris,63 streptomycin is of value in terminating the acute phase of the disease and rendering blood cultures negative. but relapses are the rule The concensus seems to be that favorable results probably can be obtained only if there is no localized focus of infection, or if such a focus of infection can be removed

There are two hopeful signs First, in vitro studies of sensitivities have not brought to light any resistant strains, most of them being inhibited by less than 5 micrograms of streptomy-Second, Live, Sperling, and Stubbs⁶⁴ treated guinea pigs infected with Brucella abortus with daily doses of 20,000 micrograms of streptomycin divided into 6 doses and obtained good re-Treatment was begun seven days after infection and continued for twenty-four days Only 7 of 35 animals yielded positive cultures on autopsy from one to fifteen days following discontinuation of therapy This is an overall bacteriologic cure of 80 per cent

The report of Keefer et al ¹⁰ on cases with positive blood cultures is not too discouraging. Thirty of 45 patients showed a decrease in fever and only 2 of 29 follow-ups have had relapses (seen from three to eight weeks after treatment was stopped). There was no response in 15 patients who received the agent. Dosage ranged from 2 to 4 Gm of streptomycin per day.

Typhoid Fever—One of the early clinical reports on streptomycin was that of Reimann et al 65 66 These investigators studied 5 cases of typhoid Of these, in only two instances was the effect of streptomycin apparently related to an abrupt improvement in the patient. In one of these patients, although he had become afeb-

rile, typhoid bacilli were still present in the stools Elias and Durso, ⁵⁰ who studied the same patients, recovered typhoid bacilli from stools containing 40 and 145 micrograms of streptomycin per gram. In vitro sensitivity tests of typhoid bacilli, isolated before therapy was begun, had shown that the organisms were killed by 6 micrograms of streptomycin. They postulated, therefore, that there might be some substance in the body which inhibited the action of streptomycin. Of considerable importance was their finding that the typhoid bacilli did not develop a resistance to streptomycin during the course of therapy.

In a second series of five typhoid patients. Remann et al 55 found streptomyein to be of apparent value in three of them However, the clinical outcome of these patients was not correlated with the sensitivity of the invading bac-One case, in which the streptomycin blood level of the patient was considerably higher than the in vitro sensitivity of the organism, resulted in complete failure, the patient dying after the administration of about 12 Gm of streptomycin at the rate of 4 Gm per day On the other hand, a second patient who was infected with a relatively resistant strain of typhoid bacillus recovered, although her streptomycin blood level was barely that required for the in vitro inhibition of the organism

None of the patients treated by Reimann et al received streptomycin by both the oral and parenteral routes, but, as pointed out by Keefer et al, 10 this combined therapy is no better than the intramuscular route alone. The concensus of the Keefer group, based upon the treatment of 51 patients, is that streptomycin in doses of 4 Gm a day did not shorten the course of the disease. What effect the agent has when given during the first week of illness and its ability to reduce the fatality rate are problems yet to be studied

The problem of streptomycin therapy in typhoid fever is, perhaps, complicated by the finding of Welch, Price, and Randall⁵⁷ that this agent has a stimulating effect on the typhoid bacillus at certain concentration levels, resulting in a higher fatality rate than would have occurred had the streptomycin been withheld. This complication perhaps can be avoided by maintaining the patient on maximum doses of streptomycin (not less than 3 or 4 Gm per day)

Salmonella Enteric Infections and Dysentery—Too few data are available to evaluate the efficacy of streptomycin in the treatment of these infections, and it is not clear to what extent the oral route of administration has been employed in combination with the parenteral ¹⁰ Although this combined method of administration has not proved of superior value in the treatment of

typhoid fever it nevertheless, should be tried in these infections. The organisms vary tremendously in their susceptibility to streptomycin, in view of which fact maximum doses of the agent should be employed.

Tuberculosis -Schatz and Waksman' in 1944 demonstrated that streptomycan was effective against Mycobacterium tuberculosis in vitro Since that time, considerable evidence has appeared which seems to show that streptomyoin is effective in controlling experimental infections of tuberculosis in animals 4.55-70 The number and size of the lesions have been decreased and life has been prolonged but in the majority of animals all of the tubercle bacilli have not been eliminated There is very little information as vet, upon which to base conclusions in regard to tuberculosis in man 18 To date the results have been disappointing as far as curative effects of streptomycin are concerned Clinical improvement in some early cases of pulmonary tuberculosis has been reported, but there seems to be little effect in the patients with long standing disease In miliary tuberculous it is thought that the course is more prolonged than usual and that more fibrosis is found at autopsy." but the results have not been striking "1,71" The most encouraging results have been reported in tuberculosis of the urmary tract7344 and the upper and middle respiratory tract 72,75 A single case of tuberculous meningitis treated with streptomycin, and reported by Cooke et al.,78 resulted in a clinical and bacteriologic cure, but a great deal more work must be done before the place of streptomycin in the treatment of tuberculosis is established

One discouraging sign is the report by You mans et al that the tubercle budillus possesses the ability to acquire resistance to streptomych both in vitro and in vivo with great rapidity. The chemistry of tuberculosis makes it seem improbable that streptomycin and the natural forces of the body can kill the tubercle bacillus before it becomes resistant

Pulmonary Suppurative Disease —Streptomycin has been employed in such cases with varying degrees of success depending upon the nature of the flora present. As pointed out by Hirshfeld et al. *many of these infections yield a mixed flora on culture and not infrequently Bacteroides melaninogenicus, anaerobic streptococci and anaerobic staphylosocci are present. It has been impossible to climinate these organisms with combined parenteral and local administration of streptomycin, and where they have per sixted, clinical results have been disappointing

In 44 cases of pulmonary infections caused by a variety of organisms and studied by Keefer's group, we twenty nine recovered or improved, seven showed no response, and eight died — It is not clear from the data presented whether or not anaerobic studies were carned out. It is noteworthy, however that thirty of these infections were caused by Friedlander's bacillus, the influenza bacillus, the colon bacillus, and Proteus vulgars, organisms that are known to be, on the whole, very susceptible to streptomycin — More extensive investigation of this group of infections is needed, however, before the results of streptomycin can be accurately evaluated — This is especially true of those pulmonary infections in which anaerobic bacteria constitute a part of the flora present

Treatment of these suppurative pulmonary infections has been mainly by the intramusoular route, but in several of them streptomycin acrosol was employed, or the agent was introduced supraglottically Olsen employed 0.5 Gm of streptomycin dissolved in 20 cc. of salline which was nebulized over a twenty-four hour period. In these instances it was possible to free the sputum of susceptible organisms and to decrease the quantity of the sputum. This regimen is also of definite value in preparing patients for surgery but is only a temporary expedient and, of course will not cure a deformed bronchial

Pertonitis —Streptomycin has not shown any spectacular results in the treatment of peritonitis, but, as pointed out by Hirshfeld et al., this disease is an unpredictable one and its treatment by chemotherapy is difficult to evaluate These authors stated, however, that streptomycin should prove to be of value in the treatment of peritonitis if the organisms causing the infection are sensitive to the agent. When its use is not attended by marked beneficial results the explanation probably lies in the presence of a mixed flom, among which are nonspore-bearing anner obes

The report to Dr Keefer's committee substantates the results obtained by Hirshfeld et al. Of 53 patients treated, 39 recovered 2 failed to respond to the agent, and 12 died. In the light of these findings, the committee felt that streptomycin should be used in all cases of peritonitis caused by streptomycin-sensitive organisms.

Spirochetal Infections —Herrell and Nichols*s treated 4 cases of early syphilis with doses of streptomycin which they considered as madequate

Temporary improvement occurred but in 3 cases in which darkfield examinations were positive relapses ensued Dunham and Rake" have shown that in experimental syphilis of rubbits penicillin G is more than 3 000 times as effective as is streptomycin. It does not seem likely

therefore, that streptomycin will come to occupy an important place in the therapy of syphilis

Heilman employed streptomycin in the treatment of experimental infections with Borrelia novyi and Leptospira icterohemorrhagiae antibiotic exerted a marked protective effect, but it was not as active as penicillin

The Use of Streptomycin in Preparation for Surgery on the Gastrointestinal Tract -Smith and Robinson have demonstrated that when given orally to mice, streptomycin will eliminate the majority of the coliform organisms from the stool and greatly decrease the total bacterial count Similar results have been obtained by Reimann They were able to eliminate all et al 55 for man aerobic bacteria from the stools of some patients. but the anaerobic organisms persisted tional study of this problem may well result in the addition of streptomycin to succinylsulfathiazole and phthalylsulfathiazole as a means of preparing the intestinal tract for surgery

Miscellaneous Surgical Infection —In such conditions as infected compound fractures and chronic ulcers, streptomycin has not been of striking benefit 49 This is probably due to the rapidity with which certain bacteria can acquire resistance to the agent, to the presence of naturally resistant bacteria, and to the difficulty of freeing any such infection of bacteria quickly

Summary

- Streptomycin, an antibiotic introduced by Schatz, Bugie, and Waksman, in 1944, has been shown to be effective against a number of gram-positive and gram-negative bacteria as well as mycobacterium tuberculosis both in vitro and m vivo
- Studies of its absorption, distribution. and excretion in man following oral and parenteral injection have been made Enough information has been accumulated to permit establishment of dosage schedules and to prove that it is relatively nontoxic
- Unfortunately, many bacteria are able to develop resistance to streptomycin very rapidly when exposed to sublethal concentrations This demands that large initial doses be employed if treatment is to be successful
- Streptomycin has proved to be strikingly effective in the treatment of tularemia, many bacteremias due to gram-negative bacilli, urinary tract infections due to susceptible organisms. Friedlander's bacillus infections, and infections caused by hemophilus influenzae Its place in the treatment of undulant fever, tuberculosis. and infections, such as peritonitis and supperative pulmonary disease, usually caused by a mixture of organisms, has not been determined

NORTON MEDICAL AWARD INVITES MANUSCRIPTS

W W Norton & Company are again offering the Norton Medical Award for book manuscripts written for the lay public by professional workers in the field of medicine. Terms of the Award have been alightly altered. The publishers now set no final closing date for the submission of manuscripts which may be submitted at any time, the Award not being limited to any one year The Norton Award offers limited to any one year \$5 000 as a guaranteed advance against royalties Either complete manuscripts or detailed table of contents together with one hundred pages of manuscript may be submitted A descriptive folder giv

garlic may be summted. A descriptive folder given guild details of the terms of the Award may be secured on request from the publishers, W. W. Norton & Co. Inc., 101 Fifth Avenue, New York 3, N. Y. Books that have previously won Norton Medical Awards are The Doctor's Job by Carl Binger, M.D., Doctore East Doctors West by Edward H. Hume M.D. and A Surgeon's Domoirs by Bertram M. Bernheim M.D., published this spring.

NOTIP FOR THE WAITER

While my husband was overseas I stored all his equipment and furniture in his consultation room Our three small children used the waiting room as a

Diayroom.

On entering the playroom one afternoon I found a little old man wedged into a small rocking chair. Toys books and games were piled high

around him. All the furniture was child-azed. The only reading matter he had been able to find was a comic book.

When I asked what I could do for him, he smiled with total unconcern and said, "Oh, nothing, thank you. I m just waiting for the doctor'—Afedical Economics April, 1947

DEPARTMENT OF THE VETERANS MEDICAL SERVICE PLAN, INC.

A PLAN FOR THE TREATMENT AND REHABILITATION OF EPILEPTIC VETERANS

Albert L Deutsch, BS, MD, and Joseph Zimmerman, AB, MD, New York City (From the Office of Veterans Administration, Branch Office Vo 2, New Yorl City)

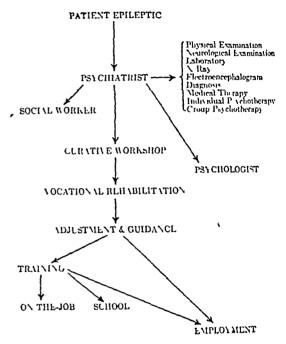

IN JULY, 1946, the Mental Hygiene Service of the New York Regional Office, Veterans Administration, was confronted with the problem of diagnosing and treating a large number of epileptics, both idiopathic and traumatic, who were appearing at the Clinic These veterans were in need of systematized observation, treatment, and vocational aid Hence, it was necessary to evolve some umfied plan which would give them a thorough medical workup, organize and systematize their treatment, and, in addition, help them plan their future so that they could become occupationally valuable This problem of making a socially adjusted and vocationally adaptable individual is very vital when one is handling veteran groups. As the program was considered, the authors realized that it had many ramifications which entered a multiplicity of fields, namely, medical, psychiatric, social service, occupational therapy, physical therapy, and vocational rehabilitation. With this in mind, the authors evolved the following integrated plan which had a two-fold purpose first, to diagnose and treat the convulsive disorder, and second, to make the patient socially and vocationally adjusted in society by securing employment and relieving his fears and anxieties of the disease, epilepsy

Procedures

The patients were referred to the Mental Hygiene Service from many sources. They came from the Medical Department, from the Vocational Rehabilitation and Training Section, from Medical Rehabilitation, and from numerous social and government agencies. There was no restriction for their admission to the Epilepsy Program other than that they be veterans, that their disorder be service-connected, and that they be desirous of securing treatment.

The patients were screened by an admitting or screening psychiatrist and were admitted to the Program if a history of convulsions, whether idiopathic or symptomatic, was present. Many patients who showed syncope, fainting spells, dizziness, or "black-outs" were admitted for differential diagnosis.

The patients were then seen by a psychiatrist who took an accurate history of the seizures, did a complete physical and neurologic examination, and evolved a plan for treatment. The psychiatrist then sent the patient to the laboratory where a complete blood count, sedimentation rate, urinalysis, blood chemistry, Kahn and glucose tolerance tests were done. In addition to the routine laboratory workup, an electroencephalogram was done on every patient. An x-ray of the skull was given to every post-traumatic case, and in addition wherever and whenever otherwise indicated. A psychiatric study included the mental status on the patient.

Diagnostic representation of patient processing to all services in a total epilepsy program

The patients were then referred to the social worker who conducted a detailed social study of their backgrounds, with special emphasis on seizures, their frequency, head trauma, and childhood diseases

Situational difficulties which could be handled by the case worker were done on this level and therapy was frequently instituted under the advice and guidance of the psychiatrist, but carried on a case work level. The patients previously were oriented to the place the social worker had in the program and there was a minimum of resistance to the worker. The usual handicaps, which were sometimes present in the social service and patient relationship, were thus avoided by this preparation of the patient.

The psychologist then saw the patients for study and psychologic therapy when indicated. A Rorschach, Thematic Apperception Test, Wechsler-Bellevue, Bender-Gestalt, Man and Woman Drawing Testa, and any additional necessary tests, were given to every patient. These studies were important

since they correlated the personality makeup of the patients and their behavior attitudes. The psychol ogst was also able to function on a thempeutic level in the group psychotherapy sessions by giving per tinent material on anxioties and tensions which so often play a part in the service pattern

The patients were then referred to the Curative Workshop where supervised occupational therapy was given as a therapoutic measure and also as a provocational training period. The patients were observed by the occupational therapist and evaluations of their capabilities, applications frequency of sciences and vocational attitudes were studied.

The Advisement and Guidance Section of the Vocational Rehabilitation Division then saw the pa tients and an analysis of their capabilities and aptitudes for employment was made Well-trained advisors were able to evaluate the patients capabili ties and suggestions for on the job training school-They worked in ing, or job placement were given close liaison with the occuational therapist of the Curative Workshop and the psychologist and were thus able to place the patient in a situation which he was capable of handling After the objective was achieved, the patients were referred either to the Training Section which carried through the mechanics of the advisement and guidance plan, or the Placement Section where attempts were made to secure them proper employment.

Since employment was a goal of the integrated program, all departments met frequently to discuss the skills, qualifications, and problems which the patients presented and they thus received the benefits of a combined medical sociopsychologic, and vocational guidance.

It was realized that many of the patients were in need of psychotherapy, in addition to their medical therapy. Group psychotherapy, sessions were held during which many of the psychiatric and psychologic problems pertaining and relating to setures were discussed. (This aspect of the group psychotherapy sessions will be discussed in a paper currently being released.)

agnetes, which as the United States Employment Bervice, which as the United States Employment Bervice, were contacted in an attempt to insure the patient placement when his solutions were controlled adequately and he was considered employable.

Summary

The plan as ovolved at the Mental Hygione Service presents a means of integrating all activities and disciplines of a well-functioning clinic into a coordinated unit and thereby eliminating vocational and social invalids and developing socially and economically adaptable cpliepties who can function in a social environment. The integrated activity of the psychiatrist, psychologist social worker, occupational therapist, and vocational adviser plays an important role in climinating the concept of "the epileptic invalid"

AMERICAN BOARD OF OBSTETRICS AND GINECOLOGI

The general oral and pathology examinations (Part II) for sil candidates will be conducted at Pittaburgh Pennsylvania, by the entire Board from Sunday June 1, through Saturday June 7, 1947 The Hotel William Penn in Pittaburgh will be the headquarters for the Board. Formal notice of the exact time of each candidate's examination will be sent him several weeks in advance of the examination dates.

Hotel reservations may be made by writing direct to the Hotel William Penn

Candidates for re-examination in Part II must make written application to the Secretary's Office not later than April 15 1947

Candidates in Military or Naval Service are requested to keep the Secretary's Office informed of any change in address.

Applications are now being received for the 1948 examinations. For further information and application blanks address Faul Titus VLD Secretary 1915 Highland Building, Pitteburgh, 6 Pennsylvania.

MEDICAL NEWS

\$3,000,000 Grants Aid Cancer Study

A TOTAL of nearly \$3,000,000 in grants for cancer research was distributed during 1945 and 1946 to finance 240 research projects in forty-eight universities, hospitals, and other institutions, it was announced in April by the American Cancer Society at a press luncheon at the Hotel New Yorker

The speakers outlined a broad coordinated attack on the cancer problem in which chemistry, biology, physics genetics, and other scientific disciplines will cooperate in the greatest concentrated effort ever made in the field of cancer to learn its cause and find methods for its prevention and cure.

Passano Foundation Award Goes to Dr Waksman

A FORMAL presentation of this \$5,000 award will be made at a dinner to be given at Atlantic City, June 12, 1947, to Dr Selman A Waksman, microbiologist at the New Jersey Agricultural Station, New Brunswick, N. J. Dr. Waksman's address is entitled, "Antibiotics and Tuberculosis,—a Microbiological Approach" Established in 1943 by the Williams and Wilkins, Company medical

publishers, of Baltimore, the two previous winners of the Award were Dr Edwin J Cohn of the Harvard Medical School and Dr Ernest W Goodpasture of Vanderbilt University Medical School The Foundation includes on its Board as representatives of the medical profession, Drs Emil Novak, Nicholson J Eastman, and George W Corner, all of Baltimore

Annual Meeting of the Society for Investigative Dermatology

THE eighth annual meeting of the Society for Investigative Dermatology will be held at the Ritz-Carlton Hotel, Atlantic City, on Tuesday, June 10, 1947

The following who will speak at the morning session of the scientific program are Dr Herman Beerman, of Philadelphia, Drs Samuel M Peck and Sheppard Siegal, and Miss Rose Bergamini, New York, Mr John F Madden, St Paul, Minnesota, Drs Stephen Rothman, J H McCreary, and A. Smiljanic, of Chicago, Drs Arthur C Curtis, Holman Taylor, and Robert H Grekin, Ann Arbor, Drs Marion B Sulzberger, Franz Herrmann, and

Frederick Zack, New York City, Dr James B Hamilton, Long Island College of Medicine

The afternoon session speakers will be Drs Jerome Sherman and Eugene Walzer, Brooklyn, Robert R Kierland and Eugene M Farber, from the Mayo Clinic, Rochester, Minnesota, S William Becker, Chicago, Edgar A Hines and Hamilton Montgomery, Mayo Clinic, Rochester, Minnesota, Sonia Dobkevitch and Rudolf L Baer from the New York Skin and Cancer Unit, Eugene S Bereston, Baltimore, Lawrence Katzenstein, University of Pennsylvania, and A. Benson Cannon, New York City

Personalities

Dr Tracy J Putnam, director of the Neurological Institute of New York, and Dr Houston Merritt, chairman of the epilepsy committee of the American Psychiatric Association, were cited April 24 for development of new drugs to treat epilepsy

At the annual luncheon of the American Epilepsy League in the Hotel Pierre it was declared that dilantin, mesantoin, and glutamic acid, developed by the doctors, had "alleviated the suffering of thousands of people with epilepsy"*

Delaware County Medical Society recently helped Dr Robert Brittain, of Downsville, celebrate his eightieth birthday Dr Brittain has served Downsville more than fifty years, settling there in 1896

In the early years of his practice it was common for him to be called to Cooks Falls or Shavertown, making the trip with horses. No weather was ever too stormy nor rough nor distance too great He still has the spirit of his youth but now makes calls with an automobile

Among those who were with him for the celebra tion were three of his sons, Robert, of Franklin, Ned of Bloomfield, New Jersey, and Dr Knov Brittain of Spencerport *

Dr John D Stewart, professor of surgery in the University of Buffalo Medical School and head of the Department of Surgery at Meyer Memorial Hospital, is one of 12 surgeons appointed to a surgery committee which will act as an advisory body to the federal services

The committee has been named by the Division of Medical Sciences of the National Research Council It will be concerned with the problems of the armed services and the Veterans Administration.

^{*} Asterisk indicates that item is from a local newspaper

Dr John J Wittmer assistant vice-president of the Consolidated Edison Company of New York, has been elected a trustee of the Long Island College of Medicine Dr Frank L. Babbott, chairman of the board of trustees, announced recently

In making the announcement Dr Babbott said "Dr Wittmer, a graduate of the college in the class of 1922, was instrumental in the establishment of our postgraduate course in industrial medicine and of other services by the college to industry fortunate to enlist the help of a man whose experience has embraced both the scientific aspects of medicine and their practical application to the prob-lems of industry His guidance will be of particular value in helping to plan for the college a expansion and development in the future.

Dr Frank O Franco has begun a practice in Bedford Hills

Serving with the U.S Army three years twenty two months of which was spent overseas with the 133 Evacuating Hospital in the European Theatre Dr Franco achieved the rating of captain *

Three Long Island doctors were recently honored in the first banquet staged by the Queens Clinical Society to recognize outstanding members of the

This process of choosing members who have distinguished themselves, and of recognizing the distinction, will be a regular part of the society s program from now on, according to Dr G E. Nightingale of Jamaica, president

The three who were honored at the banquet are Dr David Uts, of Rockville Centre for having qualified before the American Board of Pediatrics.

Dr John A. Singleton, of St. Albans, for outstanding citizenship—Dr Singleton is a member of the Mayor's Committee on Unity

Dr John E. Lowry of Flushing, for outstanding citizenship—he is a member of the Board of Trustees of the Queens Library *

Dr Paul A. Dwyer Beech Grove Place, has re-

Dr Dwyer was graduated from Manhattan College and from the Georgetown University School of Medicine.

He served his internship and residency in medicine at St. Mary's Hospital Rochester *

Dr Horace C Montgomery of Watertown, president of the Jefferson County Unit of the American Cancer Society has been named associate state chairman of the 1947 cancer campaign in seven of New York's northern counties.

Dr Montgomery will supervise campaign ac tivities in Essex, Oswego Jefferson, Lewis, St. Lawrence, Franklin, and Clinton counties.

Dr Leslie H Backus of Buffalo personal phy sician to the late President Roosevelt at the Yalta Conference was the speaker at a recent meeting of the Genesee County branch of District Number 1 of the State Nurses Association held at the Legion Home with 64 present.

Speaking on "Modern Trends in Reconstructive Plastic Surgery "Dr Backus told of his experiences while serving with the Navy and showed films of some of the work done in that line during the war At present Dr Backus is affiliated with hospitals in Buffalo and is on the teaching staff at the Univer sity of Buffalo Medical School He is also con sultant at the Veterans Hospital.

Dr Robert Peterman, of Hicksville has resumed his medical practice at his home after a six year ab-

sence while in service.

He entered the Army Medical Corps in January, 1941 and landed with the first troops in the North African invasion and later in the assault on Sicily During those invasions he was awarded the Silver Star for gallantry in action, the Bronze Star for professional skill and personal courage as battalion surgeon, and was given special mention by the late Ernie Pyle in his book, "Here Is Your War" Since his return to the States in November 1943

he was assigned to Fort Lewis, Washington, where he was chief of the medical and surgical technical courses and was advanced to rank of major *

Dr William M Smith, who before entering public health work ten years ago was a practicing phy sician in Olean, has returned to that city and resumed the practice of medicine at his former office

about April 21

Or Smith served as district State health officer in the New York State Health Department until he entered the Army Medical Corps in World War II He served oversess as well as at posts in this country and was discharged from the service with the rank of major He held a number of important posts in the Army's field of preventive medicine.

On leaving the service Dr Smith returned to the field of public health and became the State Health officer of North Dakota. He resigned that post, effective April I, to re-enter private practice in Olean.*

Dr Leon Star, recently returned after four and a half years in the Navy has opened an office for the practice of surgery in Rockaway

He was a flight surgeon in the Navy holding the rank of lieutenant-commander After obtaining his wings at Pensacola, Florida, he saw service in the African invasion Okinawa, Iwo Jima, and finally went to Japan with Admiral Halsey He was recommended for the Legion of Merit in the Pacific

Before entering the service he was graduated from the Long Island College of Medicine and served as intern and resident in surgery at Mount Sinai

Hospital.

Dr M S. Richards and Dr William Padget have opened their new offices in Tully '

Dr Jacob Sirkin, of Newark, former State School physician and Army Medical Corps officer has opened an office for the general practice of medicine On April 8 1944 he was commissioned a first

lieutenant in the Army He was trained at the Carlisle Barracks, Pennsylvania, medical field service school and served at the Percy Jones General

Hospital, Battle Creek, Michigan

Most of his three-year "hitch" was served aboard Army hospital ships and he made nine crossings of the Atlantic Ocean to England, France, and Ger-On his final crossing on the USS Wisteria he was both executive officer and medical officer He was discharged with the rank of captain

Dr William Tenenblatt, formerly of New York City, has opened offices in Spring Valley Dr Tenanblatt received his medical degree from the New York Medical College He than served an internship at Kings County Hospital in Brooklyn, New York.

He has been assistant resident obstetrician and gynecologist at Bellevue Hospital He also has served for two years as chief resident obstetrician and gynecologist at Lincoln Hospital in New York

Dr John E Heslin, of Albany, was one of the speakers at the 141st annual meeting of the Medical Society of the State of New York, at Buffalo The subject of his address, made in connection with the Society's Teaching Day, was "Development in the Care of Prostatic Disorders"*

Dr Herbert R Edwards, director of the Bureau of Tuberculosis, New York City Department of Health. has been appointed executive director of the New York Tuberculosis and Health Association

Dr Lewis B Posner has been awarded the New York State Conspicuous Service Cross by Governor Dewey for exceptionally meritorious service in the armed forces of the United States

In his military career he was first with the Third Infantry Division, later in charge of Industrial Medicine at the Boston Port of Embarkation, and finally commanding officer of the Station Hospital. S S Brenville

He has been previously awarded the Army Commendation Ribbon, American Campaign Medal, European African Middle Eastern Campaign Medal, and the World War II Victory Medal

The appointment of Dr Charles A R Connor as associate medical director of the American Heart Association, has been announced by Dr Howard F West, president of the Association

Dr Connor will work with Dr David D Rut-stein, medical director, in the development of the Association's program of research, service, and public education in diseases of the heart and circula

tion

Born in New York City, Dr Connor was grad uated from Holy Cross College and received his medical degree from New York University, College of Medicine in 1931 He was awarded the degree of Doctor of Science in Medicine by New York University, College of Medicine in 1940

Dr Evan W Thomas, of New York City, ad dressed the annual meeting of the Women's Medical Association of New York City at the Beekman Towers Hotel, April 30 Dr Thomas is associate professor of medicine at the New York University, College of Medicine, and director of the Rapid Treatment Center at Bellevue Hospital

Dr H G Weiskotten, chairman, Council on Medical Education and Hospitals, American Med ical Association, and dean, Syracuse University, College of Medicine, was among the honorary mem bers initiated at the installation of the New York Beta chapter of Alpha Epsilon Delta, national hon-

orary premedical fraternity, on April 19
The Premedical Society was organized by Mr Morton H Rachelson under the guidance of Dean Eric H Faigle and with its installation became

the 38th chapter of Alpha Epsilon Delta

County News

Albany County

At a recent meeting of the Albany County Medical Society the question of whether or not medical fees should be raised was discussed and the following resolution presented to the society by its committee

on general practice "Whereas the fees of the general practitioner have remained unchanged for many years during which time there has been marked increase in the cost of living as well as in the costs incident to the practice

of medicine, therefore, be it resolved "That the Medical Society of the County of Albany approve an increase in basic fees as follows: "Office call, \$3 00 "House call, \$4 00

"House call, received after 10.00 р м , \$5 00 "Such fees to become effective on and after May

such increases in the past no action had been taken

1, 1947 " Although other county societies have approved in Albany County since it was hoped that living costs might come down in the near future, but since such does not seem to be the case, the members of the society felt that increase in fees could no longer be postponed * be postponed '

Erre County

Recent findings on the functions of the liver have led to a better understanding of the reasons why present treatments of diabetes are successful, Dr Samuel Soskin, Chicago physiologist, reported at a recent meeting of the Buffalo Academy of Medicine in the Buffalo Museum of Science

Dr Soskin was introduced by Dr Grosvenor W. Bissell, chairman of the Academy's Section on Medi-

cine, which sponsored the meeting

Dr William J Orr, professor of pediatries at the University of Buffalo Behool of Medicine addressed the Jefferson County Medical Society at a meeting held Thursday evening, April 10 at the Hotel Wood Dr Orr's subject was the modern methods in the prevention and treatment of infectious dis-

Kings County

The barbiturate addict is just as much a danger to society as the narcotic addict Dr Charles Solomon of the Kings County Medical Society declared April 2 at a hearing by the Board of Health on proposed legislation for the control of the sale of barbiturates, the acdatives known commonly as sleeping pills.

Health Commissioner Israel Weinstein called the hearing at the Health Department Building, 125 Worth Street to outline his proposals for amend ment of the Sanitary Code in regard to barbiturates and to permit spokesmen for pharmaceutical manu facturers, pharmacists physicians and hospitals to voice their opinions of the new program

All speakers agreed on the need for stricter control of barbiturate sales. When it came to the Health Department program, however opinion was divided, with the pharmaceutical manufacturers and phar macrists lined up almost solidly against it, and most of the doctors favoring it *

The opening of the Central Medical Group of Brooklyn recently was hailed as a great step for ward in the history of medicine in the borough several prominent physicians who attended the event in the new offices of the group at 9 Lafayette Avenue

The Central Medical Group which was organized in January 1946 after about ten years of planning marks the beginning of prepaid medical group practice in the borough and brings medical group service for city employees under the contract of the Health Insurance Plan of Greater New 1 ork.

The group is composed of 21 general practitioners and specialists who, during their years of service in the army and navy realized the "greater efficiency" of this type of group practice according to a spokesman of the organization.

The group the spokesman said, will give the highest standard of medical care to its patients at a predetermined cost on an insurance basis, through the pooling of the various talents of the member

physicians.

The first two floors of the group a quarters are completed, consisting of four consultation rooms, six examining rooms, two physiotherapy rooms, and the standing rooms of the physiotherapy rooms. electrocardiograph basic metabolism and x ray

departments, and laboratory and surgery remaining two floors will be completed with the admittance of nine more physicians in the near future.*

A PIONEER PROFESSION

One of the latest and most useful adjuncts to medical practice is occupational therapy which has proved its usefulness and rehabilitating possibilities during the two world wars, being particularly elaborated during and subsequent to World War II

This form of therapy was instituted during World War I, when General Pershing called for 500 therapists to do "bedside occupational work at the front" During World War II it was adopted by the War Department for use in all army and navy hospitals It has been announced that countless thousands were speeded in their recovery when physicians prescribed this therapy as a part of the treatment to overcome sickness and disabilities

It is stated that registered occupational therapists now number 2,200, far short of the nation's demand for trained personnel The program of the Veterans Administration alone has called for 1,300 therapists by the spring of 1947 This demand offers an opportunity for training a large number of y and women to enter this useful form of se is not only applicable to army and navy

but also should have a field in civilian in The success of occupational therapy del specialized training for this class of pri In order to establish and protect the sti this profession, the American Occupations Association (33 West 42nd Street, New N Y) issued "Essentials of an Accredited Occupational Therapy" in 1935 The vidual schools established at that time hav to "twenty-five which now train the therapist in medical information and a y of arts and skills, leading to a diploma oil b The American Occupational Therapy has established the "American Journa tional Therapy" which will be issued bindwill be of use to both laymen and pl Northwest Medicine, March, 1947

NECROLOGY

Edward B Angell, M D., 90, of Rochester, died on April 23 Dr Angell received his medical degree in 1881 from the University of Pennsylvania Medical School. A founder and former president of the Rochester Medical Society, Dr Angell had also been vice-president of the American Neurological Association and the New York Medical Society He had practiced medicine in Rochester for more than fifty years, and was a former president of the Rochester Medical Society a member of the Rochester Acad emy of Medicine the American Medical Association, and the State and County medical societies

Rose Anne Bebb, M.D., of New York City, dlod on April 16. She was a graduate of the University of Minnesota Medical School in the class of 1899 Dr Bebb was a member of the American Medical Association, the Medical Society of the State of New York, New York County Medical Society, the New York Academy of Medicine, and the New York Neurological Society She was assistant alienist to the Department of Hospitals New York City at Bellevue Hospital Dr Bebb was 50 at

the time of her death.

Frederick Garilck, M.D., of Rochester died on April 22. He was graduated from Albany Medical College in 1913 He was a member of the staffs of General and Park Avenue hospitals, Rochester the American Urological Association, American Medical Association, and the State and County medical societies. He had been urologist of the Monroe County Hospital. Dr Garlick was 59 at the time of his death.

and County medical societies.

Harwood L. Hollis, M.D., 53 died on April 28. He was director of the Oswego County Tuberculosis Sanatorium, Orwell, and a member of the American Medical Association, American College of Chest Physicians, and the State and County medical socioties. He was graduated from Syracuse University, College of Mediciae, in 1920

College of Medicine, in M.D., 68 of New York City died on February 20 In 1904, he was graduated from the College of Physicians and Surgeons, Columbia University He was consultant on gynecology and obstetrics to the Lenox Hill Hospital New York, outpatient department.

Frank Liberson, M.D 58 of Brooklyn, died on April 13. He was roentgenologist in charge of the

United States Public Health Service in New York. and had been previously associated with the radiological clinic of the United States Marine Hospital Stapleton, Staten Island, and the Immigration and Naturalization Service on Ellis Island Dr Liber son was graduated from the Long Island College of Medicine in 1917 He devised many x ray improvements and wrote many articles on radiology for scientific publications. He was a member of the American Board of Radiology and the State and County medical societies.

J Francis Messemer, M.D., of the Bronx, died

on April 10 He was a podiatrician at Fordham Hospital in the Bronx In 1915, he was graduated from Columbia University College of Physicians and Surgeons. He was a member of the Bronx County Medical Society the Medical Society of the

State of New York, and the American Medical Association. He was 57 years old. Robert F Sheehan, M.D. of Scarsdale died on April 16 He was 67 Dr. Sheehan was a former professor of psychiatry at Fordham University and consulting neurologist at Kings Park State Hospital, Kings Park, Harlem Valley State Hospital Wing dale and the Benedictine Hospital, Kingston. He was president of the board of visitors of Harlem Valley State Hospital from 1928 to 1935, and at-tending neurologist at St. Mary's Hospital, Brook lyn, from 1935 to 1944

Dr Sheehan was also chief neurologist at St. Vincent's Hospital and the Community Hospital New York consulting neurologist at Misericordia Hospital and St. Clares Hospital, New York director of the child guidance clinic at St. Vincent s Hospital, and consulting psychiatrist at St. Vincent s

Retreat.

He was a member of the American Association for the Advancement of Science, the American Psychiatric Association, American Medical Association, the New York County Medical Society, Dutchess County Psychiatric Association, the Association of Military Surgeons of the United States, and the

State and County medical societies

Dr Sheehan received his medical degree in 1904 from the University of Buffalo, School of Medicine George W Shoemaker, M.D., of Syracuse, 01, died on March 29 He was one of the founders of Onondaga General Hospital and the People's Hospital and the People's Hospital and the People's Hospital Syracuse. In 1897 he was graduated from Syracuse University College of Medicine. Dr Shoemaker had practiced in Syracuse for over fifty years and as well as assisting in the founding of Onondaga General Hospital he was president and chief of the medical staff for two years

AMERICAN BOARD OF ORTHOPEDIC SURGERY

The American Board of Orthopedic Surgery will hold its next examination—Part II—in Chicago Illinois on January 22 and 23, 1948.

The deadline for receipt of completed formal appli cation and application fee is September 15, 1947

Correspondence and applications related to Part II of the examination should be sent to the Secretary of the American Board of Orthopedic Surgary Dr Francis M McKeever 1136 West 6th Street, Los Angeles 14, California.

HOSPITAL NEWS

Master Plan Given for City Hospitals

THE Hospital Council of Greater New York unfolded its master plan for hospitals and related facilities at a dinner meeting on April 22 where the plan was acclaimed by leaders in the field of health and hospital service

Geared to meet the city's requirements in 1950, the plan envisages the need for 129,000 hospital beds, based on an estimated population of 8,-000,000 three years hence

Of this total, 33,600 beds are designated for general care, 8,000 for convalescent care, 16,000 for long-term illnesses, 800 for acute communicable diseases, 6,600 for tuberculosis, and 64,000 for psychiatric care. These figures generally are in excess of present facilities and the recommended distribution is in many cases markedly different

The plan was drawn with the idea that distribu-tion and location of hospital facilities should be determined by the needs of the people, the need for teaching and training programs, and the need for

medical research

While no attempt was made to indicate where new hospitals should go, although the survey covers forty-one study areas, the plan noted that Manhattan now has fifty-seven hospitals with 16,561 beds, the Bronx, nineteen with 3,193 beds, Brooklyn, forty-six with 9,337 beds, Queens, nineteen with 2,439 beds, and Richmond, four with 541 beds It was pointed out that this bears no relation either to present or projected borough population

The plan was endorsed at the meeting by Edwin A. Salmon, chairman of the City Planning Commission, Dr John B Pastore, executive director of the Hospital Council, Dr George Baehr, presi-dent of the New York Academy of Medicine, Dr William B Rawls, representing the medical societies of the City, Dr Claude W Munger, director of St Luke's Hospital, Dr Edward M Bernecker, City Commissioner of Hospitals, and Arthur A Ballantine, chairman of the United Hospital Fund and the Greater New York Fund *

News Notes

Supreme Court Justice Henry Greenberg, in an appeal for support of the New York University-Bellevue Medical Center Fund of \$15,575,000, said April 17 that the New York University Medical School "should receive a Congressional Medal

of Honor for its lack of prejudice

The justice, who asked business and professional groups in the metropolitan area to support the fund, spoke at a dinner on behalf of the drive held at the New York University Faculty Club, 22 Washington Square North, and attended by thirty members of the state bar He praised the lack of prejudice and anti-Semitism at the medical institution and declared that a large percentage of the student body represented minority groups *

Under pressure of steadily rising expenses which produced red ink on monthly balance sheets, the Nyack Hospital has found it necessary to raise the rates for hospital services substantially. The new The new rates, approximately 35 per cent higher than those previously charged, were effective on April 1

With this increase in effect, rates at the Nyack Hospital will be in line with but not higher than the average rates already prevailing in most of the hospitals of similar size in the suburban area around New York City *

Two years of construction work on the 1,000-bed Veterans Hospital at Fort Hamilton was started after Col W F Heavy, New York district engineer, Army Corps of Engineers, broke the ground on March 31 The main building will be 16 stories It will be on an 18-acre site bordering Dyker Beach Park.*

Affiliation of the Department of Physiotherapy of Ithaca College with Auburn City Hospital was

announced April 2

President Leonard B Job of the College and Lawrence E Kresge, administrator of the hospital, in a joint statement, said that under the program begun in March, third-year students will receive clinical instruction under the supervision of Miss Ardis McCarty, head physiotherapist at the hospital, and orientation training from Richard Hardenbrook, Ithaca College instructor

Auburn City is the second hospital with which the college has become affiliated recently, the other being Robert Packer Hospital, Sayre, Pennsylvania A Garman Dingwall, assistant director of the Ithaca College physiotherapy department and supervisor of the three-year courses in Ithaca, com-

pleted the arrangements with the hospitals
Auburn City Hospital will provide a second phase of clinical practice for the Ithaca students will receive training in the care of general medical cases in the physiotherapy clinic, whereas at Robert Packer Hospital they obtain basic instruction

in orthopedics

The purpose of the hospital clinical affiliations is to give the students enough background, so that with the additional work done during the fourth and final year at the Hospital for Special Surgery in New York City, they will be able to judge which field of physiotherapy they would be best suited

Advances in rates from sixty cents to one dollar, went into effect April 1 at Jones Memorial Hospital, Wellsville The new rates are expected to reduce an estimated defeat from 200 and to 200 estimated deficit from \$36,000 to \$30,000

Daily rates announced by the hospital board of managers were \$6 for residents and \$6 50 for nonresidents in wards, \$8 for residents and \$9 for nonresidents in semiprivate room and \$9 to \$9 50 for residents and \$10 to \$10 50 for nonresidents in private rooms.

The differential between residents and nonresidents was made because village taxpayers make up 100 per cent of the deficit in hospital operating costs, while only 40 per cent of the patients are residents of the village.

Dedication ceremonies, attended by 1 000 guests, were held March 29 for the Horace Harding Hospital in Emburst, Queens, the first hospital to be completed in Queens since the war Speakers at the dedication ceremonies were Dr. Edward M. Bennecker commissioner of hospitals

Speakers at the dedication ceremonies were Dr. Edward M. Bernecker commissioner of hospitals Dr. Samuel Frank, representing Health Commissioner Israel Weinstein, Borough President James A. Burke, Dr. Louis J. Toormins, president of the hospital s board of governors. Dr. Edward A. Fleming, president of its medical board and Max Lerner the hospital s administrator.

The new hospital is privately supported Funds for its construction were raised by subscription

Thomas W Fitsgerald, president of the board of trustees of a fund to build a \$2 000 000 hospital to serve the Great Neck section of the North Shore announced April 24 that it will be situated at Bay view Avenue and Old Mill Road in the Village of Old Saddle Rock, to serve residents within a radius of five miles. Mr Fitsgerald said a campaign to raise the money for the 150-bed hospital is now being organised.

Action to keep physicians' medical records up to date at Lockport City Hospital in order to meet the requirements of the American College of Surgeons, which has omitted the institution from its list of approved hospitals for several years, has been taken by the host of menagers.

the board of managers
Physicians will be suspended from the staff seven
days after receiving notification that they are delinquent in their records and will not be parmitted to
practice until complete reports have been filed.

Utica General Hospital formally became Oneida County Hospital of Utica, on March 18, it was announced by Lewis G Fowler president of the new board of managers.

The changeover became effective with the signing a two-year leass of the institution by the county in accordance with provisions of a resolution of the Board of Supervisors and action by the Board of Managers.

The House of the Good Samaritan of Watertown recently was willed half of the \$67,000 estate of George II Bell. The bequest was given to the hospital for the building of rooms or a wing as a memorial to Mr Bell agrandparents.*

The Woman's Auxiliary of Vassar Brothers Hospital in Poughkrepsie has denated \$2,000 to the hospital's school of nursing, to be used as tuition schoolarships for student nurses.*

The growing list of corporations which have made a substantial subscription to the building fund of the North Country Community Hospital, Glen Cove has been further increased by the Columbia Ribbon and Carbon Manufacturing Company Inc., of Glen Cove, which made an unrestricted subscription of \$10,000 to the fund Announcement of the subscription was made by Frank T Powers, Jr., Chairman of the Committee on Corporation Subscriptions of the \$1.750 000 building fund.*

A four floor hospital at Thuresa, Jefferson County, has been opened by Dr Walter G Robinson, of Alexandria Bay With modern equipment, the hospital now has seventeen beds, but the building

lends itself to an easy expansion.

Working with Dr Robinson at the hospital are
Dr Robert B Burtch, recently separated from the
Navy, and Mrs. Roberts Tate Watson, R.N. former
superintendent of the Noble Hospital at Alexandra
Bay Dr Burtch, a graduate of Syracuse Univer
sity College of Medicine in 1943 interned at Brook
lyn Naval Hospital and then served as naval flight
surgeon at Pensacola, Florida. He also served in
the Naval Air Corps in different parts of the world
including New Caledonia, Guam, and Japan.

Eleven hospitals in Queens, including Rockaway Beach and St. Josephs Hospitals, have received donations of \$1 500 from the Queens Borough Lodge of Elks.*

Certain rates at the City Hospital in Schenectady were increased by the city council on March 24

The charge for private nonwelfare patients went from \$3 to \$4.50 a day for children from two to twelve years of age, and from \$5 50 to \$7 50 a day for persons thirteen years of age and older The charge for large x-rays was raised from \$5 to \$7 Other charges for private patients were left unchanged.

The charge for welfare patients went from \$3 to \$4 a day for children two to twelve and from \$5.50 to \$0.50 for persons thirteen years old and over Other charges for welfare patients were left unchanged.

The Jefferson Hospital in Middleburg, an eightbed institution that has served the Schoharze community since it was founded in 1927 by the late Mrs. Blanche Dyckman, has been sold and will be reconverted into a private residence.

The institution, first called the Dyckman Hospital but registered as the Jefferson Hospital by Dr Joseph F Duell after he obtained possession in 1937 had been managed and conducted entirely by the physician in recont years and nover received outade finantical and or exemption from taxes.

The number of cases handled there has not been computed but records reveal that in 1945 the heapital had passed a total of 2,500 major operations in addition to obstetric and other minor case operations.*

Increased rates at Good Samaritan Hospital in Suffern, effective since March 16 have been an nounced by hospital authorities

The increase was necessary to meet the rising costs of almost every item for the care of patients and the maintenance of the hospital, officials said A general increase of \$1 a day for all private and semiprivate rooms, of fifty cents per day for ward rates, and a \$5 increase for the use of the delivery room were announced *

Medical students and interns are learning to provide for mental well-being as well as physical health in the Child Guidance Clinic at Children's Hospital in Buffalo—the only clinic of its type in Upstate New York

The clinic was organized in 1930, but operated only part-time until last summer, when Dr Sherman Little was appointed director and attending

psychiatrist

He is also assistant professor of pediatrics and associate in psychiatry and mental hygiene at the University of Buffalo Medical School

The Child Guidance Clinic attempts to supply, in

organized, scientific form, the kind of information which a family doctor acquired after years of ex-

To make up a deficit in its operating costs, Children's Hospital is conducting its Guarantors' Fund campaign Buffalonians and Western New Yorkers are being asked to subscribe for one or more \$25 shares in the future of their community. If hospital expenses are kept under the budget, the full amount of the shares will not be collected, but each guarantor may be called upon to pay to the hospital annually a proportionate part of the annual deficit for each share taken *

Plans for the new veterans' hospital in Albany are about completed, and bids for the construction of the institution will be sought shortly, according to J J Rockefeller, director of construction for the Veterans Administration 4

Acclaiming Dr Marshall Latcher as one of the greatest humanitarians in Otsego and Delaware counties, a committee of Oneonta men and women have completed plans for a campaign to raise over \$25,000 for construction of a laboratory in honor of the veteran physician

Plans call for the laboratory to be constructed on the Third Street side of the Fox Memorial Hospital in Oneonta The proposed building will cost over \$18,000, it is estimated, with an additional \$7.000 to be spent for equipment. The present \$7,000 to be spent for equipment

laboratory equipment owned by the hospital, valued at over \$4,000, will be used in the new building

The move to construct the laboratory in honor of Dr Latcher for his "services to mankind" during his fifty years as a physicain was started in March. and the committee hoped that the ground breaking ceremonies would be held on the occasion of his anniversary in May *

The operating deficit of Staten Island Hospital continues to mount, the board of trustees was informed at a recent meeting in the hospital.

An operating deficit for February of \$7,019 50 was reported In January, the deficit was announced as \$8,000 Mounting costs of supplies and salaries were cited as primary factors in the It was reported that salaries also had increased \$1,000 over the previous month and \$6,000 over the same amount last year *

New Rochelle Hospital's adult medical and surgical departments were occupied 95 per cent during February, according to the monthly report of Superintendent Alex E Norton Percentage is based upon the number of patients in the hospital and the number of days in the month. vacancy lowers the total percentage

A general solicitation campaign for the hospital's \$2,000,000 building fund got under way in mid-April, the crowded condition of the hospital em-

phasizing the need for the expansion *

The alumni dinner of the New York Eye and Ear Infirmary will be held June 11 at 6 30 PM at the Marlborough-Blenheim Hotel in Atlantic City, New Jersey Announcement of the dinner was made by the alumni association secretary, Dr Brittain F Payne

Hospital public relations will be the subject of a five-day institute to be conducted by the American Hospital Association June 9 through 13 in Princeton, New Jersey, in cooperation with the New Jersey Hospital Association Nationally known public relations authorities, including members of the Princeton University faculty, will take part in the institute, which will be the first of its kind

Enrollment at the institute will be limited to 100 hospital administrators, public relations directors, and others concerned with hospital public relations who are personal members or representatives of institutional members of the American Hospital

Association

At the Helm

After thirty years as head of the obstetrics department of the New Rochelle Hospital, Dr Orville Hickok Schell has resigned from his official hospital duties He will, however, continue his private practice In January he retired as director of obstetrics at Grasslands Hospital, in Valhalla, after twenty-five years of service with that hospital The degree of honorary Doctor of Medicine has been conferred upon Dr H J Stander of the Lying-In Hospital, New York City, by Dublin Honorary Dublin Lealand. University, Dublin, Ireland *

Dr J A Rosenkrantz, formerly chief of the medical section of the outpatient department of the

Veterans' Hospital, the Bronx, has recently been appointed chief of the outpatient department of

that hospital

A graduate of the College of Physicians and Surgeons, Columbia University, Dr Rosenkrantz was formerly research assistant at the New York Post-Graduate Medical School and Hospital, in which position he contributed articles in the field of metabo-He served in the US Army Medical Corps as commanding officer of an advance section of a medical laboratory and as chief of the medical service of a station hospital. He is a diplomate of the American Board of Internal Medicine

The Medical Board of the Lutheran Hospital of Brooklyn has elected the following as officers for the current year Dr Harold Barnes, president, Dr Delfino Mascolo, vice-president, Dr Sanford Kaminester, secretary

The herculean task of directing the Pilgrim State Hospital, or any other institution of its size, was explained March 24 by Dr Harry Worthing senior director of the Pilgrim State Hospital in Brentwood, at the meeting of the Civic Association of Bay Shore and Brightwaters Dr Worthing has approximately 10,000 persons under his supervision at the hospital *

Dr Frank Glenn, associate attending surgeon at New York Hospital, has been appointed to the combined position of surgeon-in-chief of the hospital and Lewis Atterbury-Stimson professor of surgery at Cornell University Medical College, it was announced April 27

Dr Glenn will succeed Dr George J Heuer, who reaches the retirement age on July 1, and will be the second man to direct all surgical functions at the New York Hospital-Cornell Medical Center, Sixty-eighth Street and East River since its opening ın 1932 Dr Heuer has held the position since that time *

Dr Herbert L Foster, Montreal, Quebec, has been appointed pathologist and director of the laboratory of the Mercy Hospital in Watertown to fill the vacancy created by the resignation of Dr F W Porro

Dr Foster interned at St Michael's Hospital, in Toronto, and was then connected with the University of Toronto and the Pathological Institute of McGill University, Montreal. During World War II he served as a pathologist with the Canadian Army *

Dr Robert H Lowe, a veteran of five and a half years Army service, has been appointed assistant medical director and director of medical education at Rochester General Hospital

On March 15, Dr Lowe completed a postgraduate internship in hospital administration and public health at Strong Memorial Hospital in conjunction with a course at Columbia University *

staff were announced at a recent meeting of the Board of Managers of the Samaritan Hospital in Trov

The promotions were Dr Kennedy S Creevey, who was named from assistant to associate physician in the department of surgery, and Dr Samuel J Werlin from assistant to full attending physician in the department of pediatrics

Dr Raoul E Vezina, 1905 Fifth Avenue, who has been practicing general medicine here since last fall, was appointed assistant attending physician in

the department of medicine '

At the annual meeting of the Board of Trustees of the Clifton Springs Sanitarium in March, Dr Adrian S Taylor, medical superintendent of the sanitarium for the past fifteen years, tendered his In his letter to the board, Dr Taylor resignation gave no specific reason for his action, but for the past several years he has been in failing health, and it is believed that this fact is behind his action

According to Charles D Corwin, treasurer of the board, the resignation was accepted with deep regret by the members "Dr Taylor is held in high esteem by each and every member of the Sanitarium During his fifteen years here he has climaxed an outstanding career of medical service," he said.

Until such time as a successor is elected, Dr Samuel A Munford will be acting superintendent *

Permission for construction of the proposed addition to St Mary's Hospital, Albany, has been given by the Albany office of Civilian Production Administration, according to a recent announcement

Approval covers a three-story brick building at an approximate cost of \$470,000, permitting the addition of 45 beds for medical and surgical purposes, 85 maternity beds, and 35 beds for members of the order of Sisters of St Joseph of Carondolet in charge of the hospital An addition of one-story to the boilerhouse is included in the CPA permit.

That F F Thompson Hospital in Canandaigus is the only institution of its kind in that area to keep all beds open 100 per cent despite shortage of nurses and other personnel was revealed at the March meeting of the board of directors by Miss Helen F Dannahe, superintendent Statistical reports showed also that the daily average of patients was 1038 and that 60 births were recorded in February, both alltime records for the hospital *

The appointment of Dr William A Zavod as pneumatologist of Mount Vernon Hospital by the Board of Trustees was announced in March by Harold B Storms, president, who said the action was taken upon the recommendation of the Joint Advisory Committee

Commenting on the appointment, Dr Donald M Morrill, hospital director, said the board's action "is in line with new developments in these fields, and should result in improved service to the hospital

patients "*

Two promotions and one addition to the medical

Bowel Hygiene in Pregnancy

Constipation in pregnancy presents an important problem—it is usually necessary to prescribe some form of medication to maintain the patient's sense of well-being and to prevent or minimize the occurrence of hemorrhoids

Since many women suffer from bowel irregularity previous to pregnancy, it is understandable that, with the added anatomical and physiological handicaps, constipation may not respond to general measures. Kondremul with Cascara enables your patient to go through pregnancy without the discomfort of constipation.

Three types of Kondremul

Recent changes among the personnel of district health officers in Brooklyn districts have been announced by Health Commissioner Israel Weinstein Dr Jerome S Peterson, recently returned from work with UNRRA in China, will take over as health officer of the Red Hook-Gowanus Health Center At the Williamsburgh-Greenpoint Health Center, Dr Dorothy Oppenheim will replace Dr I Oscar Weissman as acting district health officer Weissman has resigned to become assistant director of the Brooklyn Jewish Hospital After twelve years as health officer of the Bushwick District, Dr Anna E Ray Robinson will head the Bedford Health District, replacing Dr Vernon A Ayer, who has transferred to the Central Harlem Health District *

The resignation of Frederick B Richards as a member of the board of directors of the Glens Falls Hospital and as its secretary-treasurer was received by the board at a meeting in March Mr Richards has been a member of the board since 1912 and secretary-treasurer since 1918 He said he was relinquishing these duties on the advice of his physi-

William H Barber resigned as vice-president, and was named secretary-treasurer, and Hubert C Brow was elected vice-president to succeed Mr Barber

Dr Robert Linehan of Glens Falls and Dr Leslie Ofner of Whitehall, were appointed to the courtesy staff, and Dr Ward Jenkins, formerly of Willsboro, was appointed to the position of resident physician.

Dr Eugene Bogen, chief of neuropsychiatric services at the Batavia Veterans Hospital, has been promoted to director of professional services at the Veterans Administration Hospital at Northport, Suffolk County On the Batavia staff since 1938, Dr Bogen has been with the Veterans Administration for twenty years He had previously served at St Cloud, Minnesota, and at Hines Memorial Hospital in Chicago

Dr Bogen's successor in Batavia will be Dr James

Hawks of the Northport Hospital

In a report of the medical staff at St Luke's Hospital, in Newburg, submitted by Dr Charles S McWilliam, the Board of Managers elected Dr James C Donovan, senior surgeon, and Dr Early C Waterbury, senior medical physician, to the cor-

On report of the nominating committee, William L Browning, Jr, was elected assistant secretary to George M Northrop, and Thomas Jamison assistant treasurer to Harry N Jamison *

Improvements

The fourth floor maternity department of the New Rochelle Hospital is being renovated this month at a cost of approximately \$5,000 ing to Alex E Norton, superintendent of the hospital, the floor has needed modernizing, cleaning, and painting for some time. Maternity patients have been moved to the second floor, recently vacated by the children who are now in the new pediatric section *

Dr Ray Palmer Baker, president of the board of Samaritan Hospital at Troy, has announced the purchase of an electromagnetic locator for the hospital's department of surgery

The new locator will be used as a supplement to the x-ray machine in the detection of metal articles in the body It will be useful in the surgery on industrial accident victims *

A check for the purchase of an ovygen tent was recently given to the City Hospital in Binghamton by the Binghamton Co-Operative Club *

New, modern nurseries have been completed at the Evangelical Deaconess Hospital in Ridgewood With space for thirty babies, the nurseries have the latest equipment, such as autoclave-sterilizer, incubators, individual bassinets, cubicles for each bassinet, and separate examination and treatment rooms *

Presentation of a Gordon Armstrong Baby Incubator to the Corning Hospital by Painted Post Lodge 117, F & A M has been announced by Miss Martha Ivers, hospital superintendent

Miss Ivers also announced receipt of a gift of \$50 from the Corning Hospital Nurses Alumni Association The money is for the purchase of needed equipment *

Work of redecorating rooms in City Hospital, Oneida, is underway Miss June Vioe, superintendent of the hospital, has reported *

Two groups of ultraviolet solarium lamps have been presented to St Agnes Hospital, in White Plains, by Westchester Chapter, National Foundation for Infantile Paralysis, Dr. William A. Holla, Westchester Health Commissioner and Chapter chairman, announced on April 2

The equipment, which cost approximately \$1,700 will enable at least 10 patients at a time to receive

treatment, Dr Holla said *

A microfilm machine, which will be used to photograph bed charts and various other hospital records on 16-mm film, has been installed at the Leonard Hospital in Troy *

Reminding people to "See Your Doctor"

Parke Davis & Company believes that people need to be constantly reminded of the value of prompt and proper medical care Educational advertisements—like the latest one, reproduced below-appear regularly, in color in LIFE and other national magazines. Audience: more than 22 million people!

Some things you should know about "stomach ulcers"

AS OTHERS SEE US

The Scene Ever Changes

NE of the fascinations of the practice of medicine is the infinite variety of human ailments presented to the doctor Further than this each sickness is an entity for the individual, often distinctly different from the same disease in another Then, too, there is the indefinite illness that does not declare itself in a type Such is our daily experience and challenge, which intrigues our ingenuity, stimulates our curiosity, and calls on the constant evercise of that most valuable of a doctor's assets—the powers of observation

Like the weather-beaten mining prospector, one may at any time run upon something rare, singular, and peculiar This is particularly true of times like these when the biologic pot has been stirred from the bottom with the wanderings of indivuals It obviously behooves us to keep our

wits sharpened and to be on the lookout

An interesting example of the above platitudes appeared in a recent issue of the Journal of the American Medical Association Case reports were given of an obscure, indefinite myalgia which ap-The men were not very peared among some troops sick and yet what was ultimately diagnosed was most interesting It happened that a spinal tap was made on one of the men, and an observant laboratory worker found some minute cells in the spinal fluid that had never been seen there before They turned out to be a yeast Further studies involving the blood showed a high lymphocyte count in all the

men affected There was no fever and no other disability other than the myalgia passed off in a few days

Such stories stimulate the imagination, and al though one realizes how multitudinous are the manifestations of mycotic infection, one thinks also that

the atypical may appear in any infection

How the scene ever changes! Where are the cases of lobar pneumonia that once took so great a death toll? Where are those syphilids which used to be shown in infinite variety to the young medical student? Now one must begin to learn something about new infections beginning to adapt themselves There is definitely a new war on, and to humans the vision of the situation stabilizing itself is not in It perhaps never will be, for the war is a continuous one And who are the soldiers of this war but the rank and file of the medical profession who are alert, intelligent, and observant? Here is an army such as Kipling describes

"An army that's never been listed, That knows no color or crest, But broke in a thousand detachments Is leading the road for the rest "

The country practitioner, the out-of-the-way doctor, need not belittle himself. He may be the Finlay or the Fleming who shows the way to new conquests of disease—Douglas Macgarlan, MD The Pennsylvania Medical Journal, April, 1947

The Physician as a Citizen

THE most difficult and momentous question of government is how to transmit the force of public opinion into public action" (Albert Bushnell Hart in A Lawrence Lowell's "Public Opinion and Popular Government")

The physician, as a rule, is little interested in his city, state, or country He enjoys the benefits of his democratic society without making the effort to continue that way of living, until the threat of

socialized medicine comes along

The physician need not run for mayor or governor or representative or senator to help, although the few physicians, among the many lawyers who make up such representative assemblies, are often able to guide legislation in more sensible and needed direc-

It would benefit the profession and the public if the few physicians who are versed in public relations, who have studied the medical needs of the country and the various plans proposed for their solution, who have given freely of their time and energy to medical societies work, were to be paid full time to continue and enlarge on such activities

The average physician can interest himself in some community activity, be it Boy Scouts, a recreation building for high school youngsters, the construction of a new hospital or improvements in an old one, the sanitation of the city jail, public health problems of all types Many of these activities border on or are in his own field —Clinical Medicine,

Shock Treatments and Other Somatic Procedures in Psychiatry By Lothar B Kalınowsky, MD, and Paul H Hoch, MD Octavo of 294 pages New York, Grune & Stratton, 1946 Cloth, \$4 50

The shock treatments of psychiatric disorders are thoroughly discussed by Kalinowsky and Hoch The book, therefore, may be regarded as an excellent reference volume for psychiatrists, who avail themselves of these procedures in treatment of mental Students and physicians in general will disorders find the book interesting reading Insulin shock and the convulsive therapies, as well as prefrontal lobotomy, are described in detail. An extensive bibliography, with a critical evaluation by the authors of adverse reports in the literature, reveals the controversial issues that these procedures have That there is much need to appear the conscience of those using these procedures is evident in the statement by the authors that "we are treating empirically disorders whose etiology is unknown with shock treatments, whose action is also shrouded in mystery "

A. M RABINER

The Medical Clinics of North America Mayo Chinic Number July, 1946 Octavo Philadelphia, W B Saunders Company, 1946 Published Bimonthly (six numbers a year) Cloth, \$16 net, Paper, \$12 net.

As always, this edition of the Clinics stresses clinical, bedside medicine Penicillin in syphilis, thiouracil, streptomycin, thiocyanates, insulins are a few of the topics covered One excellent review of about 60 pages by Hargraves presents very valuable studies on the differential diagnosis of splenomegaly

Andrew Babey

Psychoanalytic Therapy Principles and Application. By Franz Alexander, M D, and Thomas Morton French, M D, with Catherine Lillie Bacon, M D, Therese Benedek, M D, and others Octavo of 353 pages New York, Ronald Press Co, 1946 Cloth, \$5 00

There have been serious complaints that orthodox psychoanalysis, and even some of the modern and allied methods of psychotherapy are time-consuming and accessible to but a limited group of people. Hence the need for a shorter and yet efficatious method of psychotherapy, which, however, should comprise the basic principles of psychoanalytic treatment. The authors apparently have succeeded in developing such a method, and have presented it in a well-written, legible book, which, though brief and abridged, nevertheless, contains the essential principles of psychoanalysis, and offers means of brief psychotherapeutic approach in the treatments of many forms of neuroses. The book should have a wide field of application, not only to the psychiatrist, but also the psychiatric nurse.

The social service worker and the sociologist also should find it very instructive and helpful

IRVING J SANDS

Preoperative and Postoperative Treatment. Edited by Lt Col Robert L Mason (MC), AUS and Harold A Zintel, M D Second edition Octave of 584 pages, illustrated Philadelphia, W B Saunders Co, 1946 Cloth, \$700

This volume brings up to date the first edition, which was published in 1937, and contains the recent advances in pre- and postoperative treatment, such as consideration of the Rh factor in transfusions. The chapter, "Venous Thrombosis," by Dr Linton is an excellent one, and although the treatment recommended may not be in accord with the ideas of some surgeons, it, nevertheless, has proved to be important as a lifesaying measure

The book is divided into two parts, one general, and one regional, and the various contributors in each part have done an excellent job. In the regional part, the pre- and postoperative care of surgery, from ear, nose, and throat to traumatic injuries, is discussed.

The contributors to this volume should be complimented for compiling a book that will be of great help to students and surgical practitioners

HERBERT T WIKLE

Motor Disorders in Nervous Diseases By Ernst Herz, M D, and Tracy J Putnam, M D Octavo of 184 pages, illustrated New York, Kings Crown Press, 1946 Cloth, \$3 00

Originally intended as a compendium to go with a series of motion pictures illustrating this subject, the volume was amplified with diagrams and illustrations, and the result is an excellent manual on the examination of the motor aspects of the nervous system. Unfortunately, sonsory aspects of the neurologic examination were not included, which makes it necessary for the student to possess or consult another volume. The material is well presented, accurate, and up-to-date, with clear and ample illustrations

I S FREIMAN

Carbohydrate Metabolism Correlation of Physiological, Biochemical and Clinical Aspects By Samuel Soskin, M D, and Rachmel Levine, M D Octavo of 315 pages, illustrated Chicago, University of Chicago Press, 1946 Cloth, \$6.00

The authors are eminently fitted to present their subject by virtue of their own considerable contributions to the knowledge of the metabolism of carbohydrate

In discussing the apparent differences between the nonutilization and overproduction theories of the genesis of diabetes, the authors are not very convincing in their attempt to break down the case for

293 Central Park West, New York 24 N Y Tel SChuyler 4-0770

survival time of the animals that died was twentytwo days, as compared with five and five-tenth days for the controls — It would seem worthwhile, therefore, to employ streptomyein in human infections with this organism

Undulant Fever -Although in vitro studies12 indicated that streptomycin would be useful in the treatment of undulant fever, the results have Herrell and Nichols48 found not been good that the bacteremia associated with the acute phase of the disease could be held in check with Two or 3 cases they treated had streptomycin negative blood cultures after a single course of the agent The symptomatic course of these patients, however, was unaltered The third patient received three courses of streptomycin, the last following splenectomy, and six months after discharge from the hospital was afebrile and well In the latter instance, the spleen was found to be a focus of infection Chronic infections, in which blood cultures are negative, have not responded to streptomycin As pointed out by Spink and Hall,62 and Harris,63 streptomycin is of value in terminating the acute phase of the disease and rendering blood cultures negative. but relapses are the rule The concensus seems to be that favorable results probably can be obtained only if there is no localized focus of infection, or if such a focus of infection can be re-

moved There are two hopeful signs First, in vitro studies of sensitivities have not brought to light any resistant strains, most of them being inhibited by less than 5 micrograms of streptomy-Second, Live, Sperling, and Stubbs⁶⁴ treated guinea pigs infected with Brucella abortus with daily doses of 20,000 micrograms of streptomycin divided into 6 doses and obtained good results Treatment was begun seven days after infection and continued for twenty-four days Only 7 of 35 animals yielded positive cultures on autopsy from one to fifteen days following discontinuation of therapy This is an overall bacteriologic cure of 80 per cent

The report of Keefer et al ¹⁰ on cases with positive blood cultures is not too discouraging. Thirty of 45 patients showed a decrease in fever and only 2 of 29 follow-ups have had relapses (seen from three to eight weeks after treatment was stopped). There was no response in 15 patients who received the agent. Dosage ranged from 2 to 4 Gm of streptomycin per day.

Typhoid Fever—One of the early clinical reports on streptomycin was that of Reimann et al 65 66 These investigators studied 5 cases of typhoid Of these, in only two instances was the effect of streptomycin apparently related to an abrupt improvement in the patient. In one of these patients, although he had become afebratical early streptomycin apparently related to an abrupt improvement in the patient.

stools Elias and Durso, ⁵⁰ who studied the same patients, recovered typhoid bacilli from stools containing 40 and 145 micrograms of streptomycm per gram. In vitro sensitivity tests of typhoid bacilli, isolated before therapy was begun, had shown that the organisms were killed by 6 micrograms of streptomycin. They postulated, therefore, that there might be some substance in the body which inhibited the action of streptomycin. Of considerable importance was their finding that the typhoid bacilli did not develop a resistance to streptomycin during the course of therapy.

In a second series of five typhoid patients, Reimann et al ⁵⁵ found streptomycin to be of apparent value in three of them. However, the

In a second series of five typhoid patients. Reimann et al 55 found streptomycin to be of apparent value in three of them However, the clinical outcome of these patients was not correlated with the sensitivity of the invading bac-One case, in which the streptomycin blood level of the patient was considerably higher than the in vitro sensitivity of the organism, resulted in complete failure, the patient dying after the administration of about 12 Gm of streptomycin at the rate of 4 Gm per day On the other hand, a second patient who was infected with a relatively resistant strain of typhoid bacillus recovered, although her streptomycin blood level was barely that required for the in vitro inhibition of the organism None of the patients treated by Reimann et al

rile, typhoid bacilli were still present in the

received streptomycin by both the oral and parenteral routes, but, as pointed out by Keefer et al, 10 this combined therapy is no better than the intramuscular route alone. The concensus of the Keefer group, based upon the treatment of 51 patients, is that streptomycin in doses of 4 Gm a day did not shorten the course of the disease. What effect the agent has when given during the first week of illness and its ability to reduce

the fatality rate are problems yet to be studied

The problem of streptomycin therapy in typhoid fever is, perhaps, complicated by the finding of Welch, Price, and Randall⁶⁷ that this agent has a stimulating effect on the typhoid bacillus at certain concentration levels, resulting in a higher fatality rate than would have occurred had the streptomycin been withheld. This complication perhaps can be avoided by maintaining the patient on maximum doses of streptomycin (not less than 3 or 4 Gm per day).

Salmently, Enterny Infections and Disentery—

Salmonella Enteric Infections and Dysentery—Too few data are available to evaluate the efficacy of streptomycin in the treatment of these infections, and it is not clear to what extent the oral route of administration has been employed in combination with the parenteral ¹⁰ Although this combined method of administration has not proved of superior value in the treatment of

typhoid fever, it, nevertheless, should be tried in these infections. The organisms vary tromendously in their susceptibility to streptomycin, in view of which fact maximum doses of the agent should be employed.

Tuberculosis. -- Schatz and Wakaman' in 1944 demonstrated that streptomycin was effective against Mycobacterium tuberculosis in vitro Since that time, considerable evidence has appeared which seems to show that streptomyour is effective in controlling experimental infections of tuberculosis in animals 4 65-79. The number and size of the lexions have been decreased and life has been prolonged, but in the majority of animals all of the tubercle bacilli have not been eliminated There is very little information, as yet upon which to base conclusions in regard to tuberculosis in man " To date the results have been disappointing as far as curative effects of streptomycin are concerned Clinical improvement in some early cases of pulmonary tuberculosis has been reported but there seems to be little effect in the patients with long standing disease. In miliary tuberculosis, it is thought that the course is more prolonged than usual and that more fibrous is found at autopsy 🛰 but the results have not been striking 71.72 The most encouraging results have been reported in tuberculosis of the urmary tract7264 and the upper and middle respiratory tract 72.75 A single case of tuberculous meningitis treated with streptomycin and reported by Cooke et al. 14 resulted in a clinical and bacteriologie cure but a great deal more work must be done before the place of streptomycin in the treatment of tuberculosis is established

One discouraging sign is the report by You mans et al ** that the tubercle bacillus possesses the ability to acquire resistance to streptomycin, both in vitro and in vivo, with great rapidity. The chemistry of tuberculosis makes it seem in probable that streptomycin and the natural forces of the body can kill the tubercle bacillus before it becomes resistant.

Pulmonary Suppurative Disease —Streptomyein has been employed in such cases with varying degrees of success depending upon the nature of the flora present. As pointed out by Hirshfeld et al. *many of these infections yield a mixed flora on culture and not infrequently Bacteroides melaninogenious, annarobic streptococci and annarobic staphylococci are present. It has been impossible to eliminate these organisms with combined parenteral and local administration of streptomyein, and where they have per sisted, elinical results have been disappointing

In 44 cases of pulmonary infections caused by a variety of organisms and studied by Keefer's group is twenty-nine recovered or improved, seven showed no response, and eight died. It is not clear from the data presented whether or not anaeroble studies were carried out. It is noteworthy, however that thirty of these infections were caused by Friedlander's bacillus, the in fluenxa bacillus the colon bacillus and Proteus vulgaris, organisms that are known to be, on the whole, very susceptible to streptomycin. More extensive investigation of this group of infections is needed, however before the results of streptomycin can be accurately evaluated. This is especially true of those pulmonary infections in which anaeroble bacteria constitute a part of the flora present

Treatment of these suppurative pulmonary infections has been mainly by the intramuscular route but in several of them streptomycin aerosol was employed, or the agent was introduced supraglottically. Olsen employed 0.5 Gm. of streptomycin dissolved in 20 co of saline which was nobulized over a twenty four-hour period. In these instances it was possible to free the sputum of susceptible organisms and to decrease the quantity of the sputum. This regimen is also of definite value in preparing patients for surgory but is only a temporary expedient and, of course will not cure a deformed bronchial tree.

Peritonitis —Streptomycin has not shown any spectacular results in the treatment of peritonitis but, as pointed out by Hirshfeld et al., this disease is an unpredictable one and its treatment by chemotherapy is difficult to evaluate. These authors stated, however, that streptomycin should prove to be of value in the treatment of peritonitis if the organisms causing the infection are sensitive to the agent. When its use is not attended by marked beneficial results the explanation probably lies in the presence of a mixed flora among which are nonspore-bearing anaerobes.

The report to Dr Keefer's committee's substantates the results obtained by Hirshfeld et al. Of 53 patients treated 39 recovered, 2 failed to respond to the agent and 12 ded. In the light of these findings, the committee felt that streptomycin should be used in all cases of pertonnts caused by streptomycin-sensitive organisms.

Spirochetal Infections —Herrell and Nichols* treated 4 cases of early syphilis with doses of streptomycin which they considered as inadequate.

Temporary improvement occurred but in 3 cases in which darkfield examinations were positive relapses ensued. Dunham and Rake⁷ have shown that in experimental syphilis of rabbits penicillin G is more than 3 000 times as effective as is streptomycin. It does not seem likely

therefore, that streptomycin will come to occupy an important place in the therapy of syphilis

Heilman⁹ employed streptomycin in the treatment of experimental infections with Borrelia novyi and Leptospira icterohemorrhagiae antibiotic exerted a marked protective effect, but it was not as active as penicillin

The Use of Streptomycin in Preparation for Surgery on the Gastrointestinal Tract—Smith and Robinson⁷⁹ have demonstrated that when given orally to mice, streptomycin will eliminate the majority of the coliform organisms from the stool and greatly decrease the total bacterial count Similar results have been obtained by Reimann et al 55 for man They were able to eliminate all aerobic bacteria from the stools of some patients, but the anaerobic organisms persisted tional study of this problem may well result in the addition of streptomycin to succinylsulfathiazole and phthalylsulfathiazole as a means of preparing the intestinal tract for surgery

Miscellaneous Surgical Infection —In such conditions as infected compound fractures and chronic ulcers, streptomycin has not been of striking benefit 5 This is probably due to the rapidity with which certain bacteria can acquire resistance to the agent, to the presence of naturally resistant bacteria, and to the difficulty of freeing any such infection of bacteria quickly

Summary

- Streptomycin, an antibiotic introduced by Schatz, Bugie, and Waksman, in 1944, has been shown to be effective against a number of gram-positive and gram-negative bacteria as well as mycobacterium tuberculosis both in vitro and in vivo
- Studies of its absorption, distribution, and excretion in man following oral and parenteral injection have been made Enough information has been accumulated to permit establishment of dosage schedules and to prove that it is relatively nontoxic
- Unfortunately, many bacteria are able to develop resistance to streptomycin very rapidly when exposed to sublethal concentrations This demands that large initial doses be employed if treatment is to be successful
- Streptomycin has proved to be strikingly effective in the treatment of tularemia, many bacteremias due to gram-negative bacilli, urinary tract infections due to susceptible organisms. Friedlander's bacillus infections, and infections caused by hemophilus influenzae Its place in the treatment of undulant fever, tuberculosis, and infections, such as peritoritis and supperative pulmonary disease, usually caused by a mixture of organisms, has not been determined

NORTON MEDICAL AWARD IN VITES MANUSCRIPTS

W W Norton & Company are again offering the Norton Medical Award for book manuscripts written for the lay public by professional workers in the field of medicine. Terms of the Award have been slightly altered. The publishers now set no final closing date for the submission of manuscripts which may be submitted at any time the Award not being limited to any one year. The Norton Award offers \$5 000 as a guaranteed advance against royalties. Either complete manuscripts or detailed table of

contents together with one hundred pages of manuscript may be submitted. A descriptive folder giving full details of the terms of the Award may be secured on request from the publishers, W. W. Norton & Co. Inc., 101 Fifth Avanue. New York 3, N.Y. Books that have previously won Norton Medical

Books that have previously won Narton Medical Awards are The Decdor's Job by Carl Binger, M.D., Doctors East Doctors West by Edward H. Hume, M.D., and A Surfeen's Domain by Bertram M. Bernheim, M.D. published this garing.

NO TIP FOR THE WAITER

While my husband was overseas I stored all his equipment and furniture in his consultation room Our three small children used the waiting room as a playroom.

On entering the playroom one afternoon I found a little old man wedged into a small rocking chair. Toys books, and games were piled high

around him. All the furniture was child-sized. The only reading matter he had been able to find was a comic bool.

When I saled what I could do for him, he smiled with total unconcern and said, 'Oh, nothing, thank you. I m just waiting for the doctor'—Afedical Economics April 1947

MEDICAL NEWS

\$3,000,000 Grants Aid Cancer Study

TOTAL of nearly \$3,000,000 in grants for cancer A TOTAL of nearly \$5,000,000 in gradual 1945 and 1946 research was distributed during 1945 and 1946 to finance 240 research projects in forty-eight universities, hospitals, and other institutions, it was announced in April by the American Cancer Society at a press luncheon at the Hotel New Yorker

The speakers outlined a broad coordinated attack on the cancer problem in which chemistry, biology, physics genetics, and other scientific disciplines will cooperate in the greatest concentrated effort ever made in the field of cancer to learn its cause and find methods for its prevention and cure

Passano Foundation Award Goes to Dr Waksman

A FORMAL presentation of this \$5,000 award will be made at a dinner to be given at Atlantic City, June 12, 1947, to Dr Selman A Waksman, microbiologist at the New Jersey Agricultural Station, New Brunswick, N J Dr Waksman's address is entitled, "Antibiotics and Tuberculosis,—a Microbiological Approach" Established in 1943 by the Williams and Williams Company medical by the Williams and Wilkins, Company medical

publishers, of Baltimore, the two previous winners of the Award were Dr Edwin J Cohn of the Har vard Medical School and Dr Ernest W Goodpasture of Vanderbilt University Medical School. The Foundation includes on its Board as representatives of the medical profession, Drs. Emil Novak, Nicholson J Eastman, and George II Corner, all of Baltimore

Annual Meeting of the Society for Investigative Dermatology

THE eighth annual meeting of the Society for Investigative Dermatology will be held at the Ritz-Carlton Hotel, Atlantic City, on Tuesday, June 10, 1947

The following who will speak at the morning session of the scientific program are Dr Herman Beerman, of Philadelphia, Drs Samuel M Peck and Sheppard Siegal, and Miss Rose Bergamin, New York, Mr John F Madden, St Paul, Minne-sota, Drs Stephen Rothman, J H McCreary, and A. Smiljanic, of Chicago, Drs Arthur C Curtis, Holman Taylor, and Robert H. Grekin, Ann Arbor, Drs Marion B Sulzberger, Franz Herrmann, and

Frederick Zack, New York City, Dr James B Hamilton, Long Island College of Medicine

The afternoon session speakers will be Dra. Jerome Sherman and Eugene Walzer, Brooklyn, Robert R Kierland and Eugene M Farber, from the Mayo Clinic, Rochester, Minnesota, S Wilham Becker, Chicago, Edgar A Hines and Hamilton Montgomery, Mayo Clinic, Rochester, Minnesota, Sonia Dobkevitch and Rudolf L Baer from the New York Skin and Cancer Unit, Eugene S Bereston, Baltimore, Lawrence Katzenstein University ton, Baltimore, Lawrence Katzenstein, University of Pennsylvania, and A Benson Cannon, New York City

Personalities

Dr Tracy J Putnam, director of the Neurological Institute of New York, and Dr Houston Merritt, chairman of the epilepsy committee of the American Psychiatric Association, were cited April 24 for development of new drugs to treat epilepsy

At the annual luncheon of the American Epilepsy League in the Hotel Pierre it was declared that dilantin, mesantoin, and glutamic acid, developed by the doctors, had "alleviated the suffering of thousands of people with epilepsy"*

Delaware County Medical Society recently helped Dr Robert Brittain, of Downsville, celebrate his eightieth birthday Dr Brittain has served Downsville more than fifty years, settling there in 1896

In the early years of his practice it was common for him to be called to Cooks Falls or Shavertown, making the trip with horses No weather was No weather was ever too stormy nor rough nor distance too great

He still has the spirit of his youth but now makes

calls with an automobile

Among those who were with him for the celebra tion were three of his sons, Robert, of Franklin, Ned of Bloomfield, New Jersey, and Dr hnor Brittain of Spencerport *

Dr John D Stewart, professor of surgery in the University of Buffalo Medical School and head of the Department of Surgery at Meyer Memorial Hospital, is one of 12 surgeons appointed to a sur gery committee which will act as an advisory body to the federal services

The committee has been named by the Division of Medical Sciences of the National Research Coun-It will be concerned with the problems of the - Administration * armed services and t

^{*} Ast.

Dr John J Wittmer assistant vice-president of the Consolidated Edison Company of New York, has been elected a trustee of the Long Island College of Medicine Dr Frank L. Babbott, chairman of the

board of trustees announced recently

In making the announcement Dr Babbott said "Dr Wittmer, a graduate of the college in the class of 1922, was instrumental in the establishment of our postgraduate course in industrial medicine and of other services by the college to industry We are fortunate to enlist the help of a man whose experi ence has embraced both the scientific aspects of medicine and their practical application to the prob-lems of industry. His guidance will be of particular value in helping to plan for the college s expansion and development in the future.

Dr Frank O Franco has begun a practice in Bedford Hills.

Serving with the U.S Army three years, twenty two months of which was spent overseas with the 133 Evacuating Hospital in the European Theatre Dr Franco achieved the rating of captain *

Three Long Island doctors were recently honored in the first banquet staged by the Queens Clinical Society to recognize outstanding members of the society

This process of choosing members who have distinguished themselves and of recognizing the distinction, will be a regular part of the society's program from now on, according to Dr G E. Night-

ingale of Jamaica, president.

The three who were honored, at the banquet are Dr David Utz, of Rockville Centre for having qualified before the American Board of Pedlatrica.

Dr John A. Singleton of St. Albans, for outstanding citizenship—Dr Singleton is a member of the Mayor a Committee on Unity

Dr John E. Lowry of Flushing, for outstanding citizenship—he is a member of the Board of Trustees of the Queens Library *

Dr Paul A. Dwyer Beech Grove Place, has returned to Utics and opened an office at 272 Genesce. Dr Dwyer was graduated from Manhattan College and from the Georgetown University School of

Medicine. He served his internship and residency in medicine

at St. Mary's Hospital Rochester

Dr Horace C Montgomery of Watertown, president of the Jefferson County Unit of the American Cancer Society has been named associate state chairman, of the 1947 cancer campaign in seven of New York's northern counties.

Dr Montgomery will supervise campaign ac-tivities in Essex, Oswego Jefferson, Lowis, St Lawrence, Franklin, and Clinton counties.*

Dr Leslie H. Backus of Buffalo personal phy dician to the late President Roosevelt at the Yalta Conference was the speaker at a recent meeting of the Genesce County branch of District Number 1 of he State Nurses Association held at the Legion Home with 64 present.

Speaking on "Modern Trends in Reconstructive Plastic Surgery," Dr Backus told of his experiences while serving with the Navy and showed films of some of the work done in that line during the war At present Dr Backus is affiliated with hospitals in Buffalo and is on the teaching staff at the Univer sity of Buffalo Medical School. He is also con sultant at the Veterana Hospital.

Dr Robert Peterman, of Hicksville, has resumed his medical practice at his home after a six year ab-

sonce while in service.

He entered the Army Medical Corps in January 1941, and landed with the first troops in the North African invasion and later in the assault on Sicily During those invasions he was awarded the Silver Star for gallantry in action, the Bronze Star for professional skill and personal courage as battalion surgeon, and was given special mention by the late Ernic Pyle in his book, 'Here Is Your War' Since his return to the States in November 1943

he was assigned to Fort Lewis Washington, where he was chief of the medical and surgical technical

courses and was advanced to rank of major *

Dr William M. Smith, who before entering public health work ten years ago was a practicing phy sician in Olean, has returned to that city and resumed the practice of medicine at his former office about April 21

Dr Smith served as district State health officer in

the New York State Health Department until he entered the Army Medical Corps in World War IL. He served overseas as well as at posts in this country and was discharged from the service with the rank of major He held a number of important posts in

the Army's field of preventive medicine. On leaving the service Dr Smith returned to the field of public health and became the State Health officer of North Dakota. He resigned that post, effective April 1 to re-enter private practice in

Olean *

Dr Leon Star recently returned after four and a half years in the Navy has opened an office for the practice of surgery in Rockaway He was a flight surgeon in the Navy holding the

rank of lieutenant-commander After obtaining his wings at Pensacola, Florida he saw service in the African invasion, Okinawa, Iwo Jima, and finally went to Japan with Admiral Halsey. He was recommended for the Legion of Merit in the Pacific theatre of war

Before entering the service he was graduated from the Long Island College of Medicine and served as intern and resident in surgery at Mount Smail

Hospital *

Dr M. S. Richards and Dr William Padget have opened their new offices in Tully *

Dr Jacob Sirkin of Newark, former State School physician and Army Medical Corps officer, has opened an office for the general practice of medicine On A Mark to was commissioned a first

NECROLOGY

Edward B Angell, M.D., 90, of Rochester, died on April 23 Dr Angell received his medical degree in 1881 from the University of Pennsylvania Medical School. A founder and former president of the Rochester Medical Society Dr Angell had also been vice-president of the American Neurological Assoclation and the New York Medical Society practiced medicine in Rochester for more than fifty years, and was a former president of the Rochester Medical Society a member of the Rochester Academy of Medicine, the American Medical Association, and the State and County medical societies.

Rose Anne Bebb, M.D., of New York City, died on April 16 She was a graduate of the University of Minnesota Medical School in the class of 1899 Dr Bebb was a member of the American Medical Association, the Medical Society of the State of New York, New York County Medical Society, the New York Academy of Medicine, and the New York Neurological Society She was assistant allenist to the Department of Hospitals New York City, at Bellevue Hospital Dr Bebb was 50 at

the time of her death.

Frederick Garlick, M.D., of Rochester, died on April 22. He was graduated from Albany Medical College in 1913 He was a member of the staffs of General and Park Avenue hospitals, Rochester the American Urological Association, American Medical Association, and the State and County medical societies. He had been urologist of the Monroe County Hospital. Dr Garlick was 59 at the time of his death.

James A. Holley, M.D., of Walton, died on April 20 in his ninety-second year He was graduated from Albany Medical College in 1886 Dr Holley was a physician in Delaware County for sixty years and the author of the book 'Recollections of a Country Doctor He was a member of the State Country Doctor

And County medical societies.

Harwood L. Hollis, M.D., 53 died on April 28.

He was director of the Oswego County Tuberculosis Sanatorium, Orwell, and a member of the American Medical Association, American College of Chest Physicians, and the State and County medical socie-

ties. He was graduated from Syracuse University College of Medicine, in 1920 Hans E. Kudlich, M.D. 68 of New York City died on February 20. In 1904 he was graduated from the College of Physicians and Surgeons, Columbia University He was consultant on gynecology and obstetries to the Lenex Hill Hospital, New York,

outpatient department.

Frank Liberson, M.D., 58, of Brooklyn, died on April 13 He was roentgenologist in charge of the

United States Public Health Service in New York, and had been proviously associated with the radiological clinic of the United States Marine Hospital Stapleton Staten Island, and the Immigration and Naturalization Service on Ellis Island Dr Liber son was graduated from the Long Island College of Medicine in 1917 He devised many x ray improvements and wrote many articles on radiology for scientific publications. He was a member of the American Board of Radiology, and the State and County medical societies.

J Francis Messemer, M.D of the Bronx, died on April 16 He was a pediatridan at Fordham Hospital in the Bronx. In 1915 he was graduated from Columbia University College of Physician and Surgeons He was a member of the Bronx County Medical Society, the Medical Society of the State of New York and the American Education

State of New York and the American Medical Association. He was 67 years old.
Robert F Sheehan, M.D., of Scarsdale died on April 16 He was 67 Dr. Sheehan was a former April 16 He was 67 Dr Sheehan was a former professor of psychiatry at Fordham University and consulting neurologist at Kings Park State Hospital Kings Park, Harlem Valley State Hospital Wingdale and the Benedictine Hospital, Kingston. He was precident of the board of visitors of Harlem Valley State Hospital from 1928 to 1935, and attending neurologist at St. Mary's Hospital, Brook lyn. from 1935 to 1944 lyn, from 1935 to 1944.
Dr Sheehan was also chief neurologist at St.

Vincent's Hospital and the Community Hospital, New York consulting neurologist at Misericordia Hospital and St. Clares Hospital, New York, director of the child guidance clinic at St Unicent's Hospital, and consulting psychiatrist at St. Vincent's

Retreat.

He was a member of the American Association for the Advancement of Science, the American Psychiatric Association, American Medical Association, the New York County Medical Society, Dutchess County Psychiatric Association, the Association of Military Surgeons of the United States, and the State and County medical societies.

Dr Sheehan received his medical degree in 1904

from the University of Buffalo, School of Medicine. George W Shoemaker, M.D., of Syracuse, 91, died on March 29 He was one of the founders of deed on March 29. He was one of the founders of Onondags General Hospital and the People a Hos-pital Syracuse In 1897 he was graduated from Syracuse University College of Medicine. Dr Shoemaker had practiced in Syracuse for over fifty years, and, as well as assisting in the founding of Onondaga General Hospital, he was president and chief of the medical staff for two years.

The American Board of Orthopedic Surgery will hold its next examination-Part II-in Chicago, Illinois on January 22 and 23, 1948.

The deadline for receipt of completed formal appli cation and application fee is September 15, 1947 Correspondence and applications related to Part II of the examination should be sent to the Secretary of the American Board of Orthopedic Surgery, Dr Francis M. McKeever 1136 West 6th Street, Los Angeles 14, California.

HOSPITAL NEWS

Master Plan Given for City Hospitals

THE Hospital Council of Greater New York Lunfolded its master plan for hospitals and related facilities at a dinner meeting on April 22, where the plan was acclaimed by leaders in the field of health and hospital service

Geared to meet the city's requirements in 1950, the plan envisages the need for 129,000 hospital beds, based on an estimated population of 8,-

000,000 three years hence

Of this total, 33,600 beds are designated for general care, 8,000 for convalescent care, 16,000 for long-term illnesses, 800 for acute communicable diseases, 6,600 for tuberculosis, and 64,000 for psychiatric care. These figures generally are in excess of present facilities and the recommended distribution is in many cases markedly different

The plan was drawn with the idea that distribution and location of hospital facilities should be determined by the needs of the people, the need for teaching and training programs, and the need for

medical research

While no attempt was made to mind the new hospitals should go, although the new hospitals should go, although the some covers forty-one study areas, the that with Manhattan now has fifty-seven better the 16,561 beds, the Bronn, nineteen with 2,439 beds, and Religioush the state of the seven with 2,439 beds, and Religioush the seven sounded out the seven 541 beds It was pointed out that the relation either to present or privated thank population

The plan was endorsed at the meeting Eva.
A Salmon, chairman of the City Process mission. Dr John B Pastore erecting of the Hospital Council, Dr George Ending dent of the New York Academy of Mannet To William B Rawls, representing the metal centres of the City, Dr Claude W More a rector of St Luke's Hospital, Dr Erwill Bernecker, City Commissioner of Hospital and Arthur A Ballantine, chairman of the The Hospital Fund and the Greater New York Finns

News Notes

Supreme Court Justice Henry Greenberg, in an appeal for support of the New York University-Bellevue Medical Center Fund of \$15,575,000, said April 17 that the New York University Medical School "should receive a Congressional Medal

of Honor for its lack of prejudice

The justice, who asked business and professional groups in the metropolitan area to support the fund, spoke at a dinner on behalf of the drive held at the New York University Faculty Club, 22 Washington Square North, and attended by thirty members of the state bar He praised the lack of prejudice and anti-Semitism at the medical institution and declared that a large percentage of the student body represented minority groups

Under pressure of steadily rising expenses which produced red ink on monthly balance sheets, the Nyack Hospital has found it necessary to raise the rates for hospital services substantially rates, approximately 35 per cent higher than those previously charged, were effective on April 1

With this increase in effect, rates at the Nyack Hospital will be in line with but not higher than the average rates already prevailing in most of the hospitals of similar size in the suburban area around

New York City '

Two years of construction work on the 1,000-bed Two years of constitution work on the 1,000-bed Veterans Hospital at Fort Hamilton was started after Col W F Heavy, New York district engineer, Army Corps of Engineers, broke the ground on March 31 The main building will be 16 stories It will be on an 18-acre site bordering Dyker Beach Park.*

Advances in rates from sixty cents to ore office went into effect April 1 at Jones Memoria Energy Wellsville The new rates are expected a direct estimated deficit from secondary contains. estimated deficit from \$36,000 to \$30,000

Daily rates announced by the hearth had a managers were \$6 for residents and \$ 100 residents and \$ 100 residents are residents and \$ 100 residents are residents and \$ 100 residents are residents are residents are residents are residents are residents. residents in wards, \$8 for residents and \$ 1,520

residents in semiprivate room and \$9 to \$9 50 for residents and \$10 to \$10.50 for nonresidents in private rooms.

The differential between residents and non residents was made because village taxpayers make up 100 per cent of the deficit in hospital operating costs while only 40 per cent of the patients are residents of the village.

Dedication ceremonies, attended by 1 000 guests, were held March 29 for the Horace Harding Hospital in Elmhurst, Queens, the first hospital to be completed in Queens since the war

Speakers at the dedication ceremonies were Dr Edward M Bernecker commissioner of hospitals Dr Samuel Frank, representing Health Commissioner Israel Weinstein, Borough President James A Burke, Dr Louis J Taorinian, president of the hospital a board of governors, Dr Edward A Fleming, president of its medical board and Max Lerner the hospital a administrator

The new hospital is privately supported Funds for its construction were raised by subscription

Thomas W Fitzgerald, president of the board of trustees of a fund to build a \$2,000 000 hospital to serve the Great Neck section of the North Shore, announced April 24 that it will be situated at Bay view Avenue and Old Mill Road in the Village of Old Saddle Roak, to serve residents within a radius of five miles. Mr Fitzgerald said a campaign to raise the money for the 150-bed hospital is now being organized.*

Action to keep physicians medical records up to date at Lockport City Hospital in order to meet the requirements of the American College of Surgeons, which has omitted the institution from its list of approved hospitals for several years, has been taken by the board of menagers.

the board of managers.

Phymalans will be suspended from the staff seven
days after receiving notification that they are delinquent in their records and will not be permitted to
practice until complete reports have been filed.

Utica General Hospital formally became Oneida County Hospital of Utica, on March 18, it was announced by Lewis G Fowler president of the new board of managers.

The changeover became effective with the signing of a two-year lease of the institution by the county in accordance with provisions of a resolution of the Board of Supervisors and action by the Board of Managers.

The House of the Good Samaritan of Watertown recently was willed half of the \$67,000 estate of George H. Bell. The bequest was given to the hospital for the building of rooms or a wing as a memorial to Mr Bell s grandparents.*

The Woman's Auxillary of Vassar Brothers Hospital in Poughkeepsie has donated \$2,000 to the hospital's school of nursing, to be used as tuition scholarships for student nurses.

The growing list of corporations which have made a substantial subscription to the building fund of the North Country Community Hospital, Glen Cove has been further increased by the Columbia Ribbon and Carbon Manufacturing Company Inc., of Glen Cove, which made an unrestricted subscription of \$10 000 to the fund Announcement of the subscription was made by Frank T Powers, Jr., Chairman of the Committee on Corporation Subscriptions of the \$1 750 000 building fund.

A four floor hospital at Theresa, Jefferson County, has been opened by Dr Walter G Robinson, of Alexandria Bay With modern equipment, the hospital now has seventeen beds but the building leads that the an exercise and the second services are seventeen beds.

lends itself to an easy expansion.

Working with Dr Robinson at the hospital are Dr Robert B Burtch, recently separated from the Navy, and Mrs. Roberts Tate Watson, R.N., former superintendent of the Noble Hospital at Alexandra Bay Dr Burtch, a graduate of Syracuss University, College of Medicine in 1943 interned at Brook Iyn Naval Hospital and then served as naval flight surgeon at Punsacola, Florida. He also served in the Naval Altr Corps in different parts of the world including New Caledonia Guam and Japan.

Eleven hospitals in Queens including Rockaway Beach and St. Josephs Hospitals have received donations of \$1 500 from the Queens Borough Lodge of Elks.*

Certain rates at the City Hospital in Schenectady were increased by the city council on March 24

The charge for private nonwelfare patients went from \$3 to \$4.60 a day for children from two to twelve years of age and from \$5 50 to \$7.50 a day for persons thirteen years of age and older the charge for large x rays was raised from \$5 to \$7 Other charges for private patients were left unchanged.

The charge for welfare patients went from \$3 to \$4 a day for children two to twelve and from \$5.50 to \$6.50 for persons thirteen years old and over Other charges for welfare patients were left unchanged.

The Jefferson Hospital in Middleburg, an eightbed institution that has served the Schoharie community since it was founded in 1927 by the late Mrs Blanche Dyckman, has been sold and will be reconverted into a private residence.

The institution, first called the Dyckman Hospital but registered as the Jefferson Hospital by Dr Joseph F Duell after he obtained possession in 1937 had been managed and conducted entirely by the physician in recent years and never received out side finantical and n of exemption from taxes

The number of cases handled there has not been computed, but records reveal that in 1945 the hospital had passed a total of 2,500 major operations, in addition to obstetric and other minor case operations.

Increased rates at Good Samaritan Hospital in Suffern effective since March 16 have been announced by hospital authorities. The increase was necessary to meet the rising costs of almost every item for the care of patients and the maintenance of the hospital, officials said A general increase of \$1 a day for all private and semiprivate rooms, of fifty cents per day for ward rates, and a \$5 increase for the use of the delivery room were announced *

Medical students and interns are learning to provide for mental well-being as well as physical health in the Child Guidance Clinic at Children's Hospital in Buffalo—the only clinic of its type in Upstate New York

The clinic was organized in 1930, but operated only part-time until last summer, when Dr Sherman Little was appointed director and attending psychiatrist

He is also assistant professor of pediatrics and associate in psychiatry and mental hygiene at the University of Buffalo Medical School

The Child Guidance Clinic attempts to supply, in organized, scientific form, the kind of information which a family doctor acquired after years of experience

To make up a deficit in its operating costs, Children's Hospital is conducting its Guarantors' Fund campaign Buffalonians and Western New Yorkers are being asked to subscribe for one or more \$25 shares in the future of their community. If hospital expenses are kept under the budget, the full amount of the shares will not be collected, but each guarantor may be called upon to pay to the hospital annually a proportionate part of the annual deficit for each share taken.*

Plans for the new veterans' hospital in Albany are about completed, and bids for the construction of the institution will be sought shortly, according to J J Rockefeller, director of construction for the Veterans Administration *

Acclaiming Dr Marshall Latcher as one of the greatest humanitarians in Otsego and Delaware counties, a committee of Oneonta men and women have completed plans for a campaign to raise over \$25,000 for construction of a laboratory in honor of the veteran physician

Plans call for the laboratory to be constructed on the Third Street side of the Fox Memorial Hospital in Oneonta The proposed building will cost over \$18,000, it is estimated, with an additional \$7,000 to be spent for equipment The present laboratory equipment owned by the hospital, valued at over \$4,000, will be used in the new building

The move to construct the laboratory in honor of Dr Latcher for his "services to mankind" during his fifty years as a physician was started in March, and the committee hoped that the ground-breaking ceremonics would be held on the occasion of his anniversary in May *

The operating deficit of Staten Island Hospital continues to mount, the board of trustees was informed at a recent meeting in the hospital

An operating deficit for February of \$7,019 50 was reported In January, the deficit was announced as \$8,000 Mounting costs of supplies and salaries were cited as primary factors in the deficit. It was reported that salaries also had increased \$1,000 over the previous month and \$6,000 over the same amount last year.*

New Rochelle Hospital's adult medical and surgical departments were occupied 95 per cent during February, according to the monthly report of Superintendent Alex E. Norton Percentage is based upon the number of patients in the hospital and the number of days in the month. Each vacancy lowers the total percentage.

A general solicitation campaign for the hospital's \$2,000,000 building fund got under way in mid-April, the crowded condition of the hospital em-

phasizing the need for the expansion

The alumni dinner of the New York Eye and Ear Infirmary will be held June 11 at 6 30 PM at the Marlborough-Blenheim Hotel in Atlantic City, New Jersey Announcement of the dinner was made by the alumni association secretary, Dr Brittain F Payne

Hospital public relations will be the subject of a five-day institute to be conducted by the American Hospital Association June 9 through 13 in Princeton, New Jersey, in cooperation with the New Jersey Hospital Association Nationally known public relations authorities, including members of the Princeton University faculty, will take part in the institute, which will be the first of its kind

Enrollment at the institute will be limited to 100 hospital administrators, public relations directors, and others concerned with hospital public relations who are personal members or representatives of institutional members of the American Hospital

Association

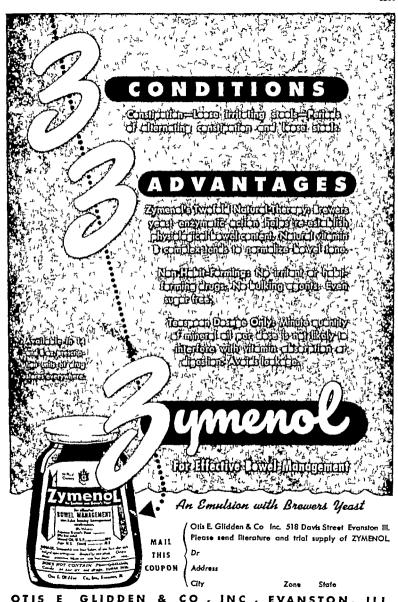

At the Helm

After thirty years as head of the obstetrics department of the New Rochelle Hospital, Dr Orville Hickok Schell has resigned from his official hospital duties. He will, however, continue his private practice. In January he retired as director of obstetrics at Grasslands Hospital, in Valhalla, after twenty-five years of service with that hospital.

The degree of honorary Doctor of Medicine has been conferred upon Dr H J Stander of the Lying-In Hospital, New York City, by Dublin University, Dublin, Ireland *

Dr J A Rosenkrantz, formerly chief of the medical section of the outpatient department of the

EVANSTON.

[Continued from page 1294]

Veterans' Hospital, the Brony, has recently been appointed chief of the outpatient department of

that hospital

A graduate of the College of Physicians and Surgeons, Columbia University, Dr Rosenkrantz was formerly research assistant at the New York Post-Graduate Medical School and Hospital, in which position he contributed articles in the field of metaboic disorders He served in the U.S. Army Medical Corps as commanding officer of an advance section of a medical laboratory and as chief of the medical service of a station hospital He is a diplomate of the American Board of Internal Medicine

The Medical Board of the Lutheran Hospital of Brooklyn has elected the following as officers for the current year Dr Harold Barnes, president, Dr Delfino Mascolo, vice-president, Dr Sanford Kaminester, secretary

The herculean task of directing the Pilgrim State Hospital, or any other institution of its size, was explained March 24 by Dr Harry Worthing senior director of the Pilgrim State Hospital in Brentwood. at the meeting of the Civic Association of Bay Shore and Brightwaters Dr Worthing has approximately 10,000 persons under his supervision at the hospital *

Dr Frank Glenn, associate attending surgeon at New York Hospital, has been appointed to the combined position of surgeon-in-chief of the hospital and Lewis Atterbury-Stimson professor of surgery at Cornell University Medical College, it was announced April 27

Dr Glenn will succeed Dr George J Heuer, who reaches the retirement age on July 1, and will be the second man to direct all surgical functions at the New York Hospital-Cornell Medical Center, Sixty-eighth Street and East River since its opening ın 1932 Dr Heuer has held the position since that

time *

Dr Herbert L Foster, Montreal, Quebec, has been appointed pathologist and director of the laboratory of the Mercy Hospital in Watertown to fill the vacancy created by the resignation of Dr F W Porro

Dr Foster interned at St Michael's Hospital, in Toronto, and was then connected with the University of Toronto and the Pathological Institute of McGill University, Montreal During World War II he served as a pathologist with the Canadian Army '

Dr Robert H Lowe, a veteran of five and a half years Army service, has been appointed assistant medical director and director of medical education at Rochester General Hospital

On March 15, Dr Lowe completed a postgraduate internship in hospital administration and public health at Strong Memorial Hospital in conjunction

with a course at Columbia University *

staff were announced at a recent meeting of the Board of Managers of the Samaritan Hospital in

The promotions were Dr Kennedy S Creevey. who was named from assistant to associate physician in the department of surgery, and Dr Samuel J Werlin from assistant to full attending physician in the department of pediatrics

Dr Raoul E Vezina, 1905 Fifth Avenue, who has been practicing general medicine here since last fall, was appointed assistant attending physician in

the department of medicine *

At the annual meeting of the Board of Trustees of the Clifton Springs Sanitarium in March. Dr Adrian S Taylor, medical superintendent of the sanitarium for the past fifteen years, tendered his resignation In his letter to the board, Dr Taylor gave no specific reason for his action, but for the past several years he has been in failing health, and it is believed that this fact is behind his action

According to Charles D Corwin, treasurer of the board, the resignation was accepted with deep regret by the members "Dr Taylor is held in high esteem by each and every member of the Sanitarium During his fifteen years here he has climaxed an outstanding career of medical service," he said.

Until such time as a successor is elected, Dr Samuel A Munford will be acting superintendent *

Permission for construction of the proposed addition to St Mary's Hospital, Albany, has been given by the Albany office of Civilian Production Administration, according to a recent announcement

Approval covers a three-story brick building at an approximate cost of \$470,000, permitting the addition of 45 beds for medical and surgical purposes, 85 maternity beds, and 35 beds for members of the order of Sisters of St Joseph of Carondolet in charge of the hospital An addition of one-story to the boilerhouse is included in the CPA permit *

That F F Thompson Hospital in Canandaigua is the only institution of its kind in that area to keep all beds open 100 per cent despite shortage of nurses and other personnel was revealed at the March meeting of the board of directors by Miss Helen F Dannahe, superintendent Statistical reports showed also that the daily average of patients was 1038 and that 60 births were recorded in February, both alltime records for the hospital

The appointment of Dr William A Zavod as pneumatologist of Mount Vernon Hospital by the Board of Trustees was announced in March by Harold B Storms, president, who said the action was taken upon the recommendation of the Joint Advisory Committee

Commenting on the appointment, Dr Donald M Morrill, hospital director, said the board's action "is in line with new developments in these fields, and should result in improved service to the hospital

patients "*

Two promotions and one addition to the medical

Bowel Hygiene in Pregnancy

Constipation in pregnancy presents an important problem—it is usually necessary to prescribe some form of medication to maintain the patient's sense of well-being and to prevent or minimize the occurrence of hemorrhoids

Since many women suffer from bowel irregularity previous to pregnancy, it is understandable that, with the added anatomical and physiological handicaps, constipation may not respond to general measures. Kondremul with Cascara enables your patient to go through pregnancy without the discomfort of constipation.

Three types of Kondremul

KONDREMUL Plain
KONDREMUL with non-bitter Extract of Cascara*
KONDREMUL with Phenolphthalein (2 2 grs phenolphthalein per tablespoonful)

*Caution Use only as directed

Reminding people to "See Your Doctor"

Parke Davis & Company believes that people need to be constantly reminded of the value of prompt and proper medical care Educa tional advertisements—like the latest one reproduced below-appear regularly, in color, in LIFE and other national magazines Audience: more than 22 million people!

Some things you should know about "Stomach ulcers"

AS OTHERS SEE US

The Scene Ever Changes

ONE of the fascinations of the practice of medicine is the infinite variety of human ailments presented to the doctor. Further than this each sickness is an entity for the individual, often distinctly different from the same disease in another. Then, too, there is the indefinite illness that does not declare itself in a type. Such is our daily experience and challenge, which intrigues our ingenuity, stimulates our curiosity, and calls on the constant exercise of that most valuable of a doctor's assets—the powers of observation.

Like the weather-beaten mining prospector, one may at any time run upon something rare, singular, and peculiar. This is particularly true of times like these when the biologic pot has been stirred from the bottom with the wanderings of indivuals and races. It obviously behooves us to keep our

wits sharpened and to be on the lookout

An interesting example of the above platitudes appeared in a recent issue of the Journal of the American Medical Association Case reports were given of an obscure, indefinite myalgia which appeared among some troops The men were not very sick and yet what was ultimately diagnosed was most interesting It happened that a spinal tap was made on one of the men, and an observant laboratory worker found some minute cells in the spinal fluid They turned that had never been seen there before out to be a yeast Further studies involving the blood showed a high lymphocyte count in all the

men affected There was no fever and no other disability other than the myalgia The sickness passed off in a few days

Such stories stimulate the imagination, and all though one realizes how multitudinous are the man ifestations of mycotic infection, one thinks also that

the atypical may appear in any infection

How the scene ever changes! Where are the cases of lobar pneumonia that once took so great death toll? Where are those syphilids which use to be shown in infinite variety to the young medical student? Now one must begin to learn something about new infections beginning to adapt themselve to humans. There is definitely a new war on, and the vision of the situation stabilizing itself is not it sight. It perhaps never will be, for the war is a continuous one. And who are the soldiers of this was but the rank and file of the medical profession who are alert, intelligent, and observant? Here is an army such as Kipling describes.

"An army that's never been listed,
That knows no color or crest,
But broke in a thousand detachments
Is leading the road for the rest"

The country practitioner, the out-of-the-way doctor, need not belittle himself. He may be the Finlay or the Fleming who shows the way to new conquests of disease—Douglas Macfarlan, M.D.

-The Pennsylvania Medical Journal, April, 1947

The Physician as a Citizen

THE most difficult and momentous question of government is how to transmit the force of public opinion into public action" (Albert Bushnell Hart in A Lawrence Lowell's "Public Opinion and Popular Government")

The physician, as a rule, is little interested in his city, state, or country. He enjoys the benefits of his democratic society without making the effort to continue that way of living, until the threat of

socialized medicine comes along

The physician need not run for mayor or governor or representative or senator to help, although the few physicians, among the many lawyers who make up such representative assemblies, are often able to guide legislation in more sensible and needed directions It would benefit the profession and the public if the few physicians who are versed in public relations, who have studied the medical needs of the country and the various plans proposed for their solution, who have given freely of their time and energy to medical societies work, were to be paid full time to continue and enlarge on such activities

The average physician can interest himself in some community activity, be it Boy Scouts, a recreation building for high school youngsters, the construction of a new hospital or improvements in an old one, the sanitation of the city jail, public health problems of all types Many of these activities border on or are in his own field —Clinical Medicine, April, 1947

RADIO TELEPHONE POLL SHOWS MAJORITY AGAINST FEDERAL MEDICINE

Listeners to the Mutual Broadcasting System's American Forum of the Air, by a majority of 11 to 9, voted "No" in a telephone poll held in connection with a debate on the topic, "Should the Federal Government Provide Medical Care?"

A breakdown of the phone calls showed that 56

per cent of the men voted "No" and 54 per cent of the women also voted in the negative

Of the total calls 60 per cent were from men listeners—Bulletin of Association of American Physicians and Surgeons, February, 1947

Where does the foot end?

A natomically at the 26th bone, but as physicians know the pinch of ill fitted shoes is not actually felt at the toes or foot as laymen think. It is really registered at the nerve endings in the head

So perhaps the head is the best measure of a proper shoe, not through the eyes alone for modish lines, but through knowing that the first and last criterion of satisfactory footwear is a properly designed and fitted shoe

For your patients who really wish to be helped few shoes, if any, are comparable to Pediformes

Shock Treatments and Other Somatic Procedures in Psychiatry By Lothar B Kalınowsky, M D, and Paul H Hoch, M D Octavo of 294 pages New York, Grune & Stratton, 1946 Cloth, \$4 50

The shock treatments of psychiatric disorders are thoroughly discussed by Kalinowsky and Hoch The book, therefore, may be regarded as an excellent reference volume for psychiatrists, who avail themselves of these procedures in treatment of mental disorders Students and physicians in general will Insuln shock find the book interesting reading and the convulsive therapies, as well as prefrontal lobotomy, are described in detail. An extensive bibliography, with a critical evaluation by the authors of adverse reports in the literature, reveals the controversial issues that these procedures have That there is much need to appease the conscience of those using these procedures is evident in the statement by the authors that "we are treating empirically disorders whose etiology is unknown with shock treatments, whose action is also shrouded in mystery '

A M RABINER

As always, this edition of the Clinics stresses clinical, bedside medicine Penicillin in syphilis, thiouracil, streptomycin, thiocyanates, insulins are a few of the topics covered One excellent review of about 60 pages by Hargraves presents very valuable studies on the differential diagnosis of splenomegaly

ANDREW BABEY

Psychoanalytic Therapy Principles and Application By Franz Alexander, M D, and Thomas Morton French, M D, with Catherine Lilhe Bacon, M D, Therese Benedek, M D, and others Octavo of 353 pages New York, Ronald Press Co, 1946 Cloth, \$500

There have been senous complaints that orthodox psychoanalysis, and even some of the modern and allied methods of psychotherapy are time-consuming and accessible to but a limited group of people. Hence the need for a shorter and yet efficacious method of psychotherapy, which, however, should comprise the basic principles of psychoanalytic treatment. The authors apparently have succeeded in developing such a method, and have presented it in a well-written, legible book, which, though brief and abridged, nevertheless, contains the essential principles of psychoanalysis, and offers means of brief psychotherapeutic approach in the treatments of many forms of neuroses. The book should have a wide field of application, not only to the psychiatrist, but also the psychiatric nurse

The social service worker and the sociologist als should find it very instructive and helpful

IRVING J SANDS

Preoperative and Postoperative Treatmen Edited by Lt Col Robert L Mason (MC), AUS an Harold A Zintel, M D Second edition Octavo 584 pages, illustrated Philadelphia, W B Sau ders Co, 1946 Cloth, \$7 00

This volume brings up to date the first edition which was published in 1937, and contains the receip advances in pre- and postoperative treatment, sure as consideration of the Rh factor in transfusion. The chapter, "Venous Thrombosis," by Dr Linte is an excellent one, and although the treatment recommended may not be in accord with the ideas some surgeons, it, nevertheless, has proved to a important as a lifesaving measure

The book is divided into two parts, one general and one regional, and the various contributors each part have done an excellent job. In the region part, the pre- and postoperative care of surger from ear, nose, and throat to traumatic injuries,

discussed

The contributors to this volume should be corplimented for compiling a book that will be great help to students and surgical practitioners

HERBERT T WIKLE

Motor Disorders in Nervous Diseases. By Ern Herz, M D, and Tracy J Putnam, M D Octav of 184 pages, illustrated New York, Kings Crow Press, 1946 Cloth, \$3 00

Originally intended as a compendium to go with series of motion pictures illustrating this subject the volume was amplified with diagrams and illustrations, and the result is an excellent manual on the examination of the motor aspects of the nervolesystem. Unfortunately, sensory aspects of the neurologic examination were not included, which makes it necessary for the student to possess or consult another volume. The material is well presented, accurate, and up-to-date, with clear an ample illustrations.

I S FREIMAN

Carbohydrate Metabolism Correlation
Physiological, Biochemical and Clinical Aspect
By Samuel Soskin, M.D., and Rachmel Levin
M.D. Octavo of 315 pages, illustrated Chicag
University of Chicago Press, 1946 Cloth, \$600

The authors are eminently fitted to present the subject by virtue of their own considerable contributions to the knowledge of the metabolism carbohydrate

In discussing the apparent differences betwee the nonutilization and overproduction theories of the genesis of diabetes, the authors are not very covincing in their attempt to break down the case for

nonutilization, especially by attacking the validity of the D.N ratio. Although they have been the major proponents of the overproduction theory, their arguments become difficult to reconcile in view of the more recent investigations from Cori's laboratory which appear to indicate that insulin plays a specific role in facilitating the enzymatic breakdown of glucose by herokinase. This, the first in vitro evidence of the role of insulin in glucose ovidation, would tend to support the nonutilization theory of diabetes, especially the demonstration that insulin destroys the inhibitory effect of anterior pituitary hormone on hexokinase activity. This is a brilliant book on the biochemistry and physiology of carbohydrate metabolism with all the controversial material presented.

WILLIAM S COLLENS

Group Psychotherapy Theory and Practice By J W Klapman, M D Octavo of 344 pages, illustrated New York, Grune & Stratton, 1946 Cloth, \$4 00

Owing to the need for treating large numbers of mentally affected patients, group psychotherapy has become an imperative prerequisite in large institutions and clinics

The author's thorough orientation in the field of psychoanalysis has facilitated his competency in understanding and describing the dynamics of transference relationship which, as in individual analysis, is the potent factor in group psychotherapy. The theoretic principles involved are based on Freud's book *Group Analysis and the Psychology of the Ego*, wherein he showed the identification of the members of the group with their leader

Several technics such as psychodrama and reeducation procedures are amply described and clinically illustrated. This book is fascinatingly written and scientifically authentic

SIMON ROTHENBERG

Ce Que la France a Apporté à la Médecine Depuis le Début du XX-e Siècle By Th Alajouanine, M D, and others Duodecimo of 276 pages Paris, Flammarion (New York, French Press and Information Service) 1946

This is a review of medicine in France since the beginning of the twentieth century. The great work of Pasteur and his pupils, organized and radiated through the Pasteur Institute, is the glorious story which it tells

There are various other contributions on the progress of medical and surgical specialties. The volume is easy reading, and makes a splendid review for any physician who has the time. The writer thinks that the frankly stated aim of this book to restore to Frenchmen their pride in their past, and in the present, will accomplish its purpose. And we agree with Professor Pasteur Vallery-Radot, that, "Car la France est grande dans le passé, grand dans le présent. Elle sera grande dans l'avenir"

STURDIVANT READ

A Bibliography of Infantile Paralysis, 1789–1944 With Selected Abstracts and Annotations Prepared under Direction of the National Foundation for Infantile Paralysis, Inc. Edited by Morris Fishbein, M.D. Compiled by Ludvig Hektoen, M.D., and Ella M. Salmonsen. Quarto of 672 pages Philadelphia, J. B. Lippincott Co., 1946. Cloth, \$15

This volume is a comprehensive compilation of the clinical and laboratory work on poliomyelits since the first description by Underwood in 1789. The papers are listed according to the year of publication. The large proportion of careful abstracts as well as the clarity of the arrangement should make this an invaluable reference work for students of the subject.

BERNARD BENJAMIN

ISSUE POSTAGE STAMP COMMEMORATING A M A CENTENNIAL, JUNE 9

Postmaster General Robert E Hannegan has approved the issuance of a commemorative postage stamp honoring the doctors of America

The special stamp will be of the three-cent variety and will be placed on sale on June 9 on the occasion of the 100th anniversary of the founding of the American Medical Association

"In so honoring the American doctor," Mr Hannegan said, "we are paying tribute to the men and women of medicine who devote their lives to the cause of humanity Alleviation of pain and suffering and the betterment of mankind is their creed. The contribution which they have made to our national life is one of which all Americans can be proud and grateful"

Details as to the place of sale and description of the stamp will be announced later—American Medical Association News, April 17, 1947

SUGGESTIONS FOR CONTRIBUTORS TO THE NEW YORK STATE IOURNAL OF MEDICINE

The New York State Journal of Medicine asks its contributors to follow the suggestions listed below in the preparation of their articles. In this way they will greatly facilitate the expeditious publication of the Journal. These suggestions have been devised in order to save correspondence avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles —It is earnestly desired that scientific articles shall not exceed 6 Journal pages at the outside Longer articles tend to lower reader interest. An average of five or six seems to be the most desirable from this point of view. Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e.g., twelve manuscript pages will make five Journal pages.

Manuscripts —Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins. They should be prepared with great care so as to be typographically correct. All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin. This is imperative for rapid and accurate composition by the printers.

Titles—The title should be brief and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters. Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives. Directly under his name should be the hospital or institution with which he is affiliated.

Subheadings —Subheadings should be in serted by the author at appropriate intervals

References —It is the unfailing practice of the New York State Journal of Medicine to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference. A list, consecutively numbered, of these references should follow at the end of the manuscript. (Note that spelling in list is same as in text.) The arrangement should be as follows and should include all items.

a. Books—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed, Philadelphia, Lea & Febiger, 1927, vol. 5, p. 57

b Periodicals—author's surname followed by

initials, name of periodical, volume, page, month (day if necessary), vear of publication Thus, Leahy, Leon J New York State J Vied 40 347 (March 1) 1940

NOTE The JOURNAL does not include titles of articles

Case Reports —Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables —While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page. For that reason it is urged that they be reduced as much as possible to descriptive language.

Illustrations —These should be kept to the minimum necessary to make clear the points to be registered by the author. In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space and the not inconsiderable cost.

When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number. Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black. India ink on white paper. Do not use typewriter for lettering. The smallest lettering on 8 × 10 inch copy should be no less than ½ inch high. Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch. If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer divisions. In the case of finely ruled paper, only blue-lined paper can be accepted. Lettering and all markings must be large enough to be readable after reduction. Mail rolled or flat, never fold Photographs should be very distinct and show clear black and white contrasts. They must be on glossy white paper. Avoid round and oval photographs.

white paper Avoid round and oval photographs
Whenever possible "crop" photographs, 1e,
mark portion that can be excluded when reproduced Crop marks should be on margin of photographs Do not run pencil lines through photographs.

It is upportant to mark the top of the illustration

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

"Fatty Indigestion"

One of the chief causes of distress

in liver, gallbladder and bile tract disturbances is impaired

fat digestion, resulting in flatulence, upper abdominal discomfort, steatorrhea, constipation and related symptoms

Of considerable importance also is the interference with absorption and utilization of iron, calcium, and fat-soluble vitamins-D, E, K and Carotene-leading to well-known deficiencies in these essential dietary factors

Degalol-chemically pure deoxycholic acid-provides Nature's emulsifier to facilitate fat digestion and absorption

In the presence of lipase (which is rarely absent), one or two tablets of Degalol t 1 d usually suffice to reduce appreciably the symptoms of impaired fat digestion and to allow for absorption of ingested fat-soluble vitamins

"I have not strength to dig; to beg I am ashamed" -LUKE 163

WHY are similar thoughts in the minds of some of our aged,

retired colleagues

BECAUSE they are, too often, denied the comforts of old agc

The care of these grand old colleagues of the Medical Profession of the State of New York must not be forgotten

Make checks payable to:

PHYSICIANS' HOME - 52 East 66th Street, New York

ion that much are permitted to afflict

Habitual Constipation of the Elderly

"Constipation in older individuals is so aften accepted as a normal condition that much avoidable ill health and discomfort are permitted to afflict these patients."

-BEENSTEIN, W C. GENATECS 1.20 MAY JUNE 1 46

Here the need for improving and maintaining the normal physiologic actions of matility absorption and secretion are all important rather than the affording of temporary relief which may result in chronicity

"SMOOTHAGE"—the gentie nonirritating action of Metamucii which facilitates elimination by the formation of a soft water retaining gelatinous residue in the large bowel and encourages return of the normal functions of absorption and secretion—supplies the desired effect in constipation management

METAMUCIL is the highly refined mucilloid of Plantago ovata (50%) a seed of the psyllium group combined with dextrose (50%) as a dispersing agent

Metamost is the epistered trademost of G. D. Searle & Co., Chicago 80e

Ferrous Iron in its most agreeable form

FEROON is Steams ferrous gluconote stabilized to remain in the ferrous state—generally accepted as the superior form of iron for humans from the standpoint of absorption as well as toleration. L2

Fergon

For Hypochromic Anemias

THERAPEUTIC APPRAISALs Better Tolerated — Fergon is only stigristy tonized, therefore virtually non-astringent, non-trifating — says and should be administered before seeds. Better Absorbed, Fergon is soluble and available for absorption, throughout the entire byt range of the gastro-testinal tract. Better United, as shown by comparative devical studies.

INDICATED in the treatment and prevention of hypochronic assentias, especially valuable in patients intolerant to other forms of Iron.

DOSAGE: Average dose for adults is three to six (5 g.) tablets; for children, one to four (21s gr.) tablets or one to four temporarily of elixir daily

SUPPLIED as 0.225 Gm. (5 gr.) tablets, bottles of 100, 500 and 1000; 0.163 Gm. (215 gr.) tablets, bottles of 100; 5% elicir bottles of 6 and 16 ft. oz.

FOR AMBULATORY PATIENTS with INJURIES OR DISEASES of the

LUMBAR SPINE

patient of intermediate stocky type-of build CAMP lumbosacral supports are widely recommended by orthopedic surgeons and physicians

An important factor in the good results reported from their use is that they extend downward over the sacro iliac and gluteal regions. The Camp adjustment provides exceptional restraint of movement.

In more severe lessons, alu minum uprights or the Camp spinal brace are easily incorporated

Camp lumbosacral sup ports are moderately priced

For patient of thin type of build

Modern

Similac is a complete, laboratory modification of cow's milk providing fat, protein, carbohydrate, and minerals in breast milk proportions—and in forms chemically and metabolically resembling those food substances as found in breast milk.

Simple

Feedings are prepared simply by adding the Similac powder to water in proportions prescribed

Safe

Simple preparation minimizes chances of error on the part of the mother

Cothical

Not advertised to the laity No directions on or in the trade package

A powdered modified milk product especially prepared for infant feeding made from tuberculin tested cow s milk (casein modified) from which part of the butter fat has been removed and to which has been added lactose cocoanul oil cocoa butter corn oil and olive oil Each quart of normal dilution Similac contains approximately 400 U S P units of Vitamin D and 2500 U S P units of Vitamin A as a result of the addition of fish liver oil concentrate

Similar to breast milk

Folliculitis. Cleared in 2 weeks with nightly Intraderm Tyrothmein compresses.

New Antibiotic Therapy for Folliculitis

You can now treat follicultus inside the lesion with Intraderm Tyrothricin Solution It penetrates normal and diseased skin down the follicles

Tyrothricin kills bacteria faster than penicillin or the sulfonamides. It has not caused sensitization. Neither serum nor necrotizing tissue inactivate it.

Unlike ordinary tyrothricin suspensions, Intraderm Tyrothricin contains 1,000 mmg of tyrothricin per ml intrue solution Surface active agents keep

both components of tyrothricin, gramicidin and tyrocidine, present in molecular form

Also indicated for furuncles, carbun cles, infected wounds and sycosis vulgaris

Reported clinical results¹ with Intraderm Tyrothricin gave favorable response in 232 cases of pyoderma

and cleansing of the tonsillar region

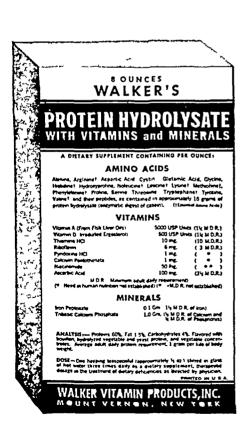

In 'sore throat, pharyngitis, tonsillitis and following ton sillectomy, Dillard's Aspergum affords quick relief by bringing its contained analgesic into immediate contact with the inflamed pharyngeal and tonsillar areas. Further advantages

- 1 Increases salivary flow continuously laves with acetyl salicylic acid all oropharyngeal areas including those seldom reached by gargles or irrigations
- 2 Stimulates activity of muscles of mastication and de glutition reduces local spasticity and stiffness
- 3 By enhancing patient comfort, encourages early ingestion of suitable diet hastens convalescence
- 4 Assures patient cooperation through ready acceptance by all, including children

Ethically promoted In packages of 16, moisture proof bottles of 36

spergum

effective hyperalimentation, it is important to specify a protein hydrolysate product that does not present a taste barrier. The palatability of Walker's PROTEIN HYDROLYSATE with VITAMINS and MINERALS assures the physician of success in securing the patient's cooperation.

INDICATIONS Pre- and postoperative dietary therapy, peptic ulcer and certain other gastrointestinal diseases, nutritional edema and anemia, pregnancy and lactation, febrile disease, periods of active growth and senescence, and wherever protein hydrolysate-vitamin supplementation is indicated

Available through all prescription pharmacies Professional literature on request.

the modern Physicians'

Phospho-

Soda

LAXATIVE

With an impressive record of clinical acceptance over the years, Phospho-Soda (Fleet) is today the ethical cathartic of choice for thousands of physicians when a gentle but thoroughly effective saline eliminant is indicated D'Antoni, Scherer, 2 Travell and others, have attested in current medical literature the value of such phosphates of soda for prompt, innocuous elimination • Phospho Soda (Fleet) is a scientific combination of two recognized phosphates of soda in a stable, uniform and acceptable liquid form Its palatability ease of administration, and mild yet efficient laxative action - with marked freedom from griping - make it a constantly growing prescription favorite • Phospho-Soda (Fleet) is promoted exclusively to the medical and dental professions Supplied in bottles of 21/2, 6 and 16 fluid ounces

For Controlled Catharis Prescribe

C B FLEET CO.INC

PHOSPHO-SODA

FLEXIBILITY

Pediatricians recognize the advantages of flexibility in prescribing infant feeding formulas as the protein fat and carbohydrate requirement may vary with the individual baby Formula preparation with CARTOSE* is simple, rapid and accurate

CARTOSE supplies carefully balanced proportions of nonfermentable dextrins in association with maltose and dextrose. Due to the time required for hydrolysis of the higher sugars absorption is spaced. This lessens the likelihood of distress attributable to the presence of excessive amounts of readily fermentable sugars in the intestinal tract at one time When supplementation with vitamins of the B complex is indicated KINNEY'S YEAST EXTRACT* is suggested for routine incorporation in the daily feeding. The full daily dose is simply added to the twenty four hour formula.

KINNEY'S YEAST EXTRACT is prepared from a specially cultured yeast and contains all the known factors of the B complex in natural palatable form.

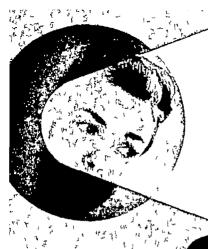

CARTOSE and KINNEY'S YEAST EXTRACT are offered for use under the guidance of physicians. They ere available only at drugstores.

The normal gall bladder lining is a soft, delicate mucosal layer characterized by numerous minute pockets over its surface. When inflamed it becomes thickened and coarse to a variable degree Biliary stasis is believed to be a major factor in inciting a catarrhal inflammation which, with secondary infection, may progress to a more virulent cholecystiss, with or without cholelithiasis

DEHYDROCHOLIC ACID ARMOUR is a powerful hydrocholagogue and choleretic It induces a copious outflow of thin, watery bile which is low in total solids in effect, a physiologic "flushing-out" of the biliary tract It is indicated in the medical management of chronic

gall-bladder cases with or without stones, provided there is no actual obstruction. It is of value also in functional hepatic insufficiency, in liver poisoning, by drugs or anesthetics, in cirrhosis, and in chronic passive congestion of the liver. It is contra indicated in obstructive jaundice

Supplied in 3¾ grain tablets—bottles of 50, 100 500 Dosage 1 to 3 tablets t 1 d with meals. Literature on request

Dehydrocholic Acid

THE ANNOUN LABORATORIES

LAFAYETTE BENEDICT MENDEL, 1872-1935

Leader in the Study of Nutrilion

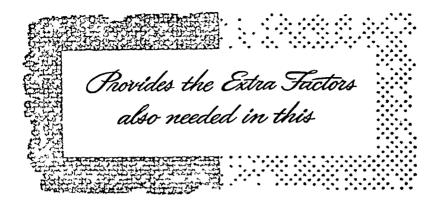

THE MODERN SCIENCE OF NUTRITION was greatly enriched and advanced by the original contributions of Lafayette Benedict Mendel

He and T B Osborne were the first to describe eye changes as a sign of avitaminosis and they showed that vitamin B protects against polyneuritis and is essential for stimulation of growth and appetite. In experimental scurvy tests with guinea pigs. Mendel and B Cohen demonstrated the existence of the antiscorbutic vitamin C. As Professor of Physiological Chemistry at Yale. University. Mendel published more than 300 papers, many of them classics in the literature of nutrition.

THE TACILITIES and effort of the Harrower Laboratory. Inc. are pledged to service of the aillied professions of medicine and pharmocy and the best interests of public health.

Startomer LABORATORY INC . GLENDALE CALIFORNIA

RAPID clinical response in the syndrome of hypochromic (secondary) anemia usually requires more inclusive therapy than iron medication alone. The characteristic lethargy, anorexia, listlessness, and disturbed gastrointestinal function reflect the many metabolic derangements involved. Hence effective therapy must also be directed against these associated symptoms before complete return of well-being can be produced.

The well-balanced, rational formula of Livitamin With Iron is designed to combat the many manifestations of the protean syndrome characteristic of hypochromic anemia. It provides not only highly available iron in nonionic form, but also generous quantities of B complex vitamins as well as fresh liver (as liver concentrate) containing the fraction in which the recognized antianemia principle is found. Thus existing vitamin deficiencies, so often the cause of anorexia and nutritional involvements, are promptly overcome, further adding to the patient's subjective improvement as the anemia itself is corrected.

Livitamin With Iron proves highly efficacious in all types of secondary anemia, whether due to impaired iron intake, chronic blood loss, or chronic systemic

infection It is especially valuable in the anemia of children which is so often associated with malnutration and vitamin deficiencies. Dosage 3 to 4 teaspoonfuls three times daily

Each fluidounce of Livitamin With Iron, prepared with an attractive, pal atable vehicle presents
Iron and Manganese Peptonized 30 gr (Equivalent to 45 mg elementary Iron) Iron Peptonized N F 12½ gr (Equivalent to 140 mg elementary Iron) Thiamine Hydrochloride (B₁) 10 mg Riboflavin (B₂, G) 5 mg Nicotinamide (Niacinamide) 25 mg Nicotinamide (Niacinamide) 1 mg Pyridoxine Hydrochloride (B₆) 1 mg Pyridoxine Hydrochloride (B₆) 1 mg Calver Concentrate 1 20 45 gr (Represents 2 oz fresh liver) Rice Bran Extract

now!

palatable, protected whole protein

for

maxımal metabolic efficiency

The I ttal Importance of Protein Therapy is widely recognized but protein is not easy to administer in adequate amounts. Intravenous infusions are complex costly often hazardous Protein lividrolysates or amino-acid preparations for oral use are frequently not readily acceptable or are injecting to the patient especially in the very large quantities necessary for replacement of body protein lost in burns, fractures, hemorrhage, febrile or wasting illnesses, and in many other conditions.

O 'DELCOS' Protein-Carbohydrate Granules are highly palatable, even in large doses, easily administered and well tolerated. This new Sharp & Dohme preparation provides all the essential amino acids, as whole protein, concentrated and balanced for maximal nutritional efficiency easily digested, and readily absorbed.

Carbolydrate (30%) spares the protein of DELCOS Granules from wasteful use as energy and favors its efficient utilization for repair of tissue and production of blood antibodies and other vital body proteins

O 'DELCOS' Granules contain a balanced combination of casein and lactalbumin. The combination is nutritionally superior to either of these top-quality milk proteins alone, and about 20% more effective than beefsteak

Supplied in 1 lb and 5 lb wide mouthed jars Sharp & Dohme Philadelphia 1 Pa

pH VALUE The normal vaginal pH lies between 40 and 50 Both Lactikol Jelly (pH 415) and Lactikol Creme (pH 49) are within this normal range and so tend to maintain the proper pH value of the vaginal tissues

SPERMICIDAL POWER Both Lactikal Jelly and Lactikal Creme immobilize sperm instantly on contact

VISCOSITY The viscosity of Lactikol Jelly and Lactikol Creme is carefully controlled so as to maintain a suitable barrier action and avoid unaesthetic leakage in use

LUBRICITY Lactikal Jelly with a vegetable gum base,

provides a highly lubricating medium Lactikol Creme with a cream base, is less lubricating The choice between these lies with the preference of the patient

STABILITY Both Lactikol Jelly and Lactikol Creme remain stable for several years and can withstand extreme variations in atmospheric temperature

ACTIVE INGREDIENTS Lacticol Jelly: Lactic Acid, 1.5%; Glyceryl Monoricinoleate, 1 0%, Sodium Lauryl Sulfate, ō ½%; Oxyquinoline Sulfate, 0 05%

Lactikol Creme: Lactic Acid, 0.5%; Glyceryl Mono ricinoleate, 1 5%; Sodium Lauryl Sulfate, 0 6%

MEAT...in special form for

High-Protein Diets

Swift's **Strained Meats**

provide a palatable source of complete, high quality proteins for soft, smooth diets

> Mony doctors have written to tell us that Swift s Strained Meats developed by Swift & Company for feeding to infants provide an excellent basis for high protein diets in adults when the patient s condition necessitates soft, bland mixtures for oral feeding or special preparation for tube feeding

> These all ment products in specially strained form offer a palatable, watheral source of complete, high quality proteins B vitamins and minerals Swift's Strained Meats are convenient to use—come ready to heat and serve. They provide a tempting variety accepted by patients even when normal appetite is impaired. The line of Swift's Strained Meats comprises beef lamb potk veal, liver and heart.

Proposed from selected lean U S Government Inspected Meats, carefully trummed to reduce fat content to a minimum Swift's Strained Meats are especially suited to high protein, low residue diets. The meats are strained fine enough to pass through the nipple of a nursing bottle may easily be used in tube feeding. Each vacuum sealed tin contains 3½ ounces of strained lean meat.

All untritional statements made in this advertise ment are accepted by the Council on Foods and Natrition of the American Modical Association.

We will be glad to send you complete information and samples of Swift's Strained Meats, if you will write Swift & Company Dept BF Chicago 9, Ill

STERILIZE the stopper, insert a sterile hypodermic needle, and withdraw the required dose. It is that simple to prepare an injection of B complex vitamins from Ampoules 'Betalin Complex' (Vitamin B Complex, Lilly). This prepared solution contains the five most essential vitamins of the B complex in convenient, ready-to-use, 10-cc rubber-stoppered ampoules.

Each cc contains	
Thiamin Chloride	5 mg
Riboflavin	2 mg
Nicotinamide	75 mg
Pantothenic Acid (as Calcium Pantothenate)	25 mg
Pyridoxine Hydrochloride (Vitamin B. Hydrochloride)	5 mg

The date appearing on each package of Ampoules 'Betalin Complex' indicates the period for which the solution will retain full potency provided it is properly stored

Ampoules 'Betalin Complex' may be used intravenously or intramuscularly and, when added to dextrose infusions, will prevent acute avitaminosis. They are quickly available through your usual source of medical supplies.

The Annual Meeting

Held this year for the first time in the Memorial Auditorium at Buffalo, the Annual Meeting of the Medical Society of the State of New York, May 5 through May 9, was attended by 1,316 physicians, 254 guests, and 401 exhibitors, a grand total of 1,971 persons

Normal local weather conditions prevailed, but could not compete with the cheerful friendliness and well remembered hospitality of the Buffalonians whose warm hearts and kindliness made one forget the cold, the ice in the lake, and the echoing drab, cavernous vastness of the Memorial Auditorium

The House of Delegates convened on May 5 for the one hundred and forty-first Annual Meeting Dr Albert F R. Andresen, of Brooklyn wielded the gavel as speaker of the House

Dr Louis H Bauer, of Hempstead, Long Island, President of the Society, called on the medical profession to assume a militant leadership in guiding the public toward an improved and wider national health program

Dr Bauer, President-Elect of 1046, who took office as president last January, follow-

ing the death of Dr William Hale, of Utica, said the medical profession must be forward looking in its program of medical care

He declared that physicians could not wait for things to happen on the question of

a national health program

"We must exercise leadership and guide the public," he said "Our voluntary plans of insurance, which are but one factor in an improved national health program, have progressed more rapidly the past year, but progress is still too slow. Controversies between indemnity and service plans, and between nonprofit and commercial plans must be eliminated.

"Whatever is best for the public must be our aim. The next few years will settle this matter once and for all and our action must be both progressive and aggressive."

He stressed the importance of the medical profession being alerted "to the importance of our planning." He warned of an existing laussez-faire attitude on the part of too many doctors

Dr Bauer expressed the belief that physicians could endorse in principle, but with some amendments, the Federal Taft-Smith Ball-Donnell Bill which calls for establishment of a national health agency outside the Cabinet, with a doctor of medicine as its head

He was critical of the Wagner-Murray-Dingell Bill, on which committee hearings have been held in Washington, "because medical care would be placed under bureaucratic control"

Dr Bauer declared that the Fulbright-Taft bill, which provides for establishment of an executive department of education, health, and security, with an undersecretary in charge of each division, had some merit

The further proceedings of the House of Delegates will be reported in later issues of the Journal

Well over one hundred scientific papers were read before the various sections and general sessions. Many of these papers will appear in the Journal as rapidly as space and paper will permit, so that those who could not hear them presented at the Annual Meeting may read them in these columns

A special advisory committee, headed by Dr Milton I Levine, of New York City, reported the first state-wide program using BCG vaccine in the fight to prevent tuber-culosis

Bacillus Calmette Guerin, known as BCG, developed from TB germs in cows, is being prepared in the State Health Department laboratory and has been distributed in limited quantity to a few hospitals and other institutions ¹

Papers dealing with the role of vitamin E in fibrositis, the condition of patients exposed to the effects of atomic bombing, balneotherapy in poliomyelitis, the three principal causes of maternal deaths with a discussion of their prevention, and the role of music in the treatment of psychiatric cases

elicited much interest at the scientific sessions

The annual reception tendered by the officers of the Society to the exhibitors was well and enthusiastically attended. Under many unavoidable difficulties due to the use of the Memorial Auditorium for the first time, our friends, the exhibitors, made a splendid and attractive showing of the latest improvements in drugs, apparatus, and scientific equipment of all kinds.

The Annual Banquet on Wednesday night featured the recognition of those physicians of the State who have practiced fifty years or more, and the presentation to them of certificates honoring their service to humanity Dr Nathan B Van Etten graciously responded for the group of 400, seventy-one of whom were present at the Banquet

The President-Elect, Dr Leo F Simpson, was introduced by Dr Louis A Bauer, incoming President

Dr R L Sensenich, chairman of the Board of Trustees of the American Medical Association, and guest of honor of the Society, spoke briefly but eloquently of the "Future of Medicine" His address will be reported in full in the Journal

Dr Helen G Walker, newly elected presi dent of the Women's Medical Society, read a short address

Presentation of the President's Medal for William Hale, M D, posthumously awarded to his son, Mr William Hale, Jr, by Dr James F Rooney, honored one who had literally given to the Society the last full measure of devotion

The Editors wish to extend on behalf of the Society sincere thanks to the Committee on Arrangements who are to be heartily congratulated on an excellent and intricate job well done

The Problem of Specialty Boards

Speaking to the American Orthopedic Association in 1947, Dr J Albert Key in his presidential address voiced alarm because of the rigidity of the standards set up by the various specialty boards to determine the qualifications of the practitioners of medi-

cine or surgery who wish to be admitted to the practice of their professions as qualified specialists. We quote from the standards set up by the American Board of Orthopedic Surgery

1 One year rotating internship

¹ See N Y State J Med April 1 1947, p 698

- 2. One year in adults' orthopedic surgery
- 3 One year in children's orthopedic surgery
- 4 One-half year internship in fractures
 5 One-half year full time study of funda-
- o One-half year full time study of fundamental subjects—anatomy, pathology, bacteriology, physiology, and biochemistry

6 Two years in practice limited to orthopedic surgery

To those interested in the qualifying of specialists by boards we recommend the close reading of Dr. Key's address, which we cannot reprint here '

We defy any milhonaire aspirant—one to whom time and money are no object—to find the internships which are required by the American Board of Orthopedic Surgery. If he could, he would then be stymied by item No. 5, and after he had passed that, how could he serve two years in the practice of orthopedic surgery as required in item 6? He is still unqualified. How could the Board recommend that? According to them, he should be restrained from practicing as a specialist without their hierose, though qualified by the state or national boards to practice medicine and surgery.

There is thus created a dilemma The specialty boards have assuredly done an excellent and praisoworthy job of elevating standards Nobody would undo that work But in all uplifting there is a point beyond which too many other values must be sacrificed to gain one objective Has that point been reached?

Of course there must be qualifications set up for the fitness of those who exercise over the rest of us the power of life and death Hitherto this has been done by the State Board Examinations and by the reputation—good or bad—which a surgeon ac quired in his community The judgment of his peers. Remember?

We feel that to allow self-styled selfappointed specialists to crown themselves as censors to determine the qualifications of others to earn their living in a certain way can be dangerous

Is there not a place in the practice of the profession of surgery for men who have

drifted along in it and by some freak of fortune—war, for example—find themselves with an absorbing interest in orthopedic surgery, or plastic surgery, or any specialty for which their general experience and their later interest makes them qualified? The Board system takes us back to the medieval days of Henry VIII, when the surgeons, forced to unite with the barbers, set up the rigid apprenticeship and guild system, a partnership from which they were not able to escape until 1740

Examiners on boards are rarely omniscient. May we remind the members of these boards, who are now so blithely setting the standards for their successors, that, brilliant men as they may be, outstanding as they are in their specialties, they are older men who never had to pass such examinations themselves and, if faced with them, could probably not do so now

Our purpose in raising the question of present practices in qualifying doctors as specialists is not pointless criticism of the boards, but sincere evaluation of method, and some remarks on possible abuses. The boards have done too much good to risk having their work jeopardized by a senseless wave of reaction.

There must be a moderate course realistically related to human and economic values which could preserve the gains without sacrifice of abilities obtained through simple experience. We know of no way to improve matters except by raising the question for free discussion

We realize that these associations, these boards, are set up out of zeal for the protection of the people. With the passage of the vears many of them seem to have been in vaded by the corruption of the self-interested. Those who are now in, being after all human beings, are potentially able to keep others out. They could reserve their privileges for their sons, their assistants—in short, for their successors. We fear a reversion to the guild system. We seem to remember that the 'common man' did a pretty good job of protecting himself in the past. He simply stayed away from the incompetent practitioner and let him starve to death

To those of our readers who are really

interested in every aspect of this perplexing problem we recommend an article in the Saturday Evening Post of March 15, 1947 (Vol 219, No 37, page 23) by Comdr W J Lederer, USN

He got himself into Annapolis and subsequently attained his present rank without any formal training. He devoted sedulous and unflagging attention to the care of the head. It's a good idea.

Current Editorial Comment

Get Her Up Get Her Out!—We have been much interested in the recent development of a radical trend in surgery—that of getting patients out of bed and on their feet as early as the first or second postoperative day. We all know that postoperative complications such as pneumonia and thrombophlebitis occur, but they have usually been ascribed to an act of God. We congratulate the surgeons who have the courage—and the confidence in their suture material—to insist on this early ambulation, though we shudder to think of what the blow to a man's reputation might be who got his patient early out of bed and then had a thrombophlebitis occur anyway.

We vividly remember a friend of ours who was a surgeon, and had done much work in the treatment of empyema. He, unfortunately, contracted pneumonia, and subsequently developed empyema, and was operated on. When we saw him some time after, we enquired as to how he had enjoyed his personal experience with empyema.

"Empyema?" he replied "There's nothing to that But my God, that bed pan!" And we should have said, to use a homely phrase, that he was one of the toughest eggs we knew We are sure that early ambulation and avoidance of the bed pan will do much to mitigate the rigors of postoperative convalescence

Accordingly, we were interested in Mr Thackeray's views upon the subject written just ninety-nine years ago ¹ Miss Crawley was seriously ill because of her nephew Rawdon's unfortunate marriage and was being devotedly nursed by her brother's wife, Mrs Bute Crawley, who hoped thus to divert the old of the stantime to her own

1 Thackeray William boards to inity Fair Vol 1 London, 1848

family Her family doctor had called in a consultant

"That Hampshire woman will kill her in two months, Clump, my boy, if she stops about her," Dr Squils said "Old woman, full feeder, nervous subject, palpitation of the heart, pressure on the brain, apoplexy, off she goes Get her up, Clump, get her out, or I wouldn't give many weeks' purchase for your two hundred a year"

We Suspected It. "The kitchen," says the Statistical Bulletin, 1" is the most dangerous room in the house" Many persons are injured there annually by cuts, scalds, burns, gas poisoning, conflagration. About 6,000 men, women, and children are killed every year from mishaps originating in kitchens. Seems as though kitchens were concentrated bad luck, 2,000 yearly are fatally burned or scalded there, about 1,500 die as the result of falls, gas suffocates many, roach powders, rat poison, kept there frequently, are mistaken for flour or baking powder with unhappy results

Kitchens seem to combine all the worst hazards of factory, bakery, cannery, laundry, butcher shop, restaurant, and household workshop, not to mention, as the Bulletin

points out, playground

Incidentally, this survey takes no account of the possible, though not necessarily fatal, indigestion, chronic grouches, sour dispositions, idiopathic high blood pressure, stubborn constipation, gallbladder disease, to name a few conditions, which have their origin in bad, indifferent, unattractive, and, sometimes, ruinous food preparation Young brides take notice. We bring this up for what good it may do

CLINICAL USE OF PRODUCTS OF HUMAN PLASMA FRACTIONATION

CHARLES A JANEWAY, M D, Boston, Massachusetts

(From the Department of Pediatrics Harvard Medical School and School of Public Health and from the Infants and Children & Hospitals Roston)

IT IS a great pleasure to be here and an honor to give this first Elliot T Bush Memorial Lecture I did not have the good fortune to know Dr Bush personally but I have heard that he was the kind of person who exemplified by his own conduct the way of dealing with patients with fellow physicians and with pupils which all of us in the practice of medicine would like to follow

Tonight we are to cover a field where we have a union of one of the most basic of all the medical sciences—physical chemistry—with public health medicine, surgery pediatrics and all the fields of medical practice. I would like to empha size that the work we are reviewing was carried on as a team project involving a great many people in our own particular medical center people in many other universities, and physicians in many parts of the United States and abroad It would not have been possible without the remarkable job of blood collection by the American Red Cross, and could not have been carried out as fast as it was without the financial support of the government through the Office of Scientific Research and Development

In these days of great enthusiasm for pouring large quantities of funds into medical research is very important to bear in mind that the type of research which I am going to review had its real source in the curiosity of human beings about fundamental phenomena. We in the practice of medicine are frequently the beneficiaries of the investigations of scientists who work in fields that seem extremely remote from the everyday practice of medicine

Blood is an extremely complex fluid which ties all parts of the body together, the blood stream is the transportation system for foodstuffs, waste

First Annual Elliot T Bush Memorial Lecture, delivered at a meeting of the Chemung County Medical Society Elmira, New York, April 24 1946

Most of the work described in this lecture was carried out under a contract recommended by the Committee of Medical Research between the Office of Scientific Research and Development and Harvard University products, and the many enzymes, hormones and chemically active substances which regulate bodily functions. The blood performs its many functions through a large number of highly specialized molecules which have been developed in the course of evolution for these various purposes.

If a bottle of blood is centrifuged, the lower layer consists of millions and millions of red cells each of which contain millions of protein molecules, principally hemoglobin, which consists of a protein globin and a prosthetic group, in which the active principle is ferrous iron. The latter makes it possible to transport oxygen in large amounts to the tissues. Within the red cell, in addition to hemoglobin, are many ensymes. In the next layer lie the white cells and platelets. rather unstable components of the blood, which so far have not been separated and preserved for therapeutic use Plasma, the fluid in which these cells are suspended, differs from the physiologic salt solution that we administer so often by virtue of its content of proteins. These plasma proteins carry out numerous functions Perhaps the most basic one is the maintenance of osmotic pressure due to the fact that the molecules are so large that they do not traverse readily the wall of the capil laries and, therefore, are retained within the blood stream to a very large extent. In consequence of this and certain other chemical characteristics, they hold an adequate volume of fluid in the circulation so that the plasma proteins and the blood cells can circulate through the capil laries of the body We know that if we reduce the plasma proteins sufficiently the osmotic rela tionships are markedly disturbed, and edema results

In addition they have a function of binding many small molecules. For instance, iron, so necessary for the building of hemoglobin in the red cells, has to get to the hemoglobin forming tissues and recently it has been found that there is a plasma globulin which is able to take up iron and transport it from one portion of the body to another Certain other small molecules are held within the blood stream and carried by similar mechanisms. Vitamin A, for example, circulates in combination with protein, and probably most of the other lipids which circulate in the blood are not present free, but attached to proteins. This makes it possible for fat-soluble substances to be carried in aqueous solution.

In addition, there are numerous enzymes, some of them present only in traces as a spill-over in the normal functioning of organs The amounts may rise markedly in disease, as, for example, the increase in blood diastase in acute pancreatitis These enzymes are proteins, consisting generally of a globulin molecule to which is attached a smaller group which gives it its specific function hormones, such as the steroid hormones of the adrenal cortex, or hormones arising from the pituitary gland, are most of them proteins or attached to proteins and circulate in small traces in the plasma The immune substances, antibodies and complement, are plasma proteins, as are those substances responsible for the normal clotting of the blood

Not only is the plasma a complex system in itself, but its protein components stand in very intimate relationship to the protein systems of the body tissues. The liver cells perhaps enter into this relationship more intimately than any other cells in the body, taking protein from the circulation, utilizing it for their own ends, and synthesizing it into other combinations which are needed both within the cells and outside Although plasma proteins stay within the circulation to a large extent, small amounts constantly are passing through the capillary walls, and thus are present in all the body fluids, almost indubitably they enter into the cells all over the body in one form or another

Methods for the separation of blood into its active components are not new Centrifugation makes it possible to separate the cells on the one hand and the plasma on the other If we are going to utilize blood properly we should not discard those cells and just use the plasma are already under way which show that it is possible to use the cells, resuspended in a suitable medium, as replacement therapy for patients with various types of anemia in which there is an adequate supply of plasma proteins but a deficiency in red blood cells. Using resuspended cells, a patient can be given as much as a liter and a half a day so that the erythrocyte count is restored to normal in a much shorter time than would be possible with whole blood, where only 40 per cent of the material injected is what the patient needs

The fractionation process begins with separation of the plasma from the cells Plasma from

a group of donors is pooled in a large flask, from which material is then siphoned into a number of 500 cc bottles, frozen, and dried from the frozen state. Plasma prepared in this way is stable enough to be shipped all over the world and is ready for use when reconstituted with sterile distilled water.

Besides whole plasma, it is possible to prepare the various plasma protein components as separated fractions for therapeutic use. This seems like a very complicated process, but, actually, when carried out on a large scale, it is remarkably economical and simple. In the large plants which grew up during the war to prepare blood derivatives for the armed forces the process of plasma fractionation was carried on in cold rooms at 5 degrees below zero centigrade, that is, below the freezing point of water. The attendants work in warm clothing, and a few chemists with several assistants can process pools containing as many as 10,000 bleedings a week.

The basic process depends upon precipitating the proteins selectively with alcohol The classic methods of separating proteins consist of salting them out with neutral salts, chiefly sodium or ammonium sulfate You cannot inject a high concentration of sulfate ion into patients, and in order to get rid of these ions the protein must be dialyzed During the process of dialysis, bacteria are apt to multiply and render the product unsuit-Furthermore, it is an expensive able for use By the new process devised by Dr process Cohn and his associates the proteins are precipitated with alcohol, then run through a centrifuge, similar to a cream separator, which takes off the supernatant fluid and throws out the precipitated protein as a paste. These pastes consist of protein, a little water, and alcohol In the next step in the process, the paste is quick frozen and dried from the frozen state by the same process which is used for drying of plasma. Alcohol ordinarily damages plasma proteins, but if all manipulations are kept below the freezing point of water, which is possible in the presence of alcohol, the proteins are protected from denaturation low temperature inhibits bacterial growth, and thus the final products obtained from this process are satisfactory for human injection 1

After drying, the materials appear as dry white powders, in which form most of the plasma proteins are stable and can be stored until needed. They then can be dissolved, sterilized by filtration, and filled into final containers.

We pass now to a consideration of these fractions themselves and then uses in clinical medicine and surgery ²³ Fraction I, the first fraction precipitated, contains 60 per cent fibringen, which is an adequate degree of purification for clinical use Fibringen molecules are special-

ized to form the blood clot They are long needle-like molecules The result is that a solu tion containing more than 2 per cent fibrinogen becomes very viscous Fibrinogen circulates in the blood at about 0.2 Gm per cent concen-In clotting, thrombin acts on these long fibringen molecules so that they are linked together to give the tangled fibrillar structure of the clot. Fibringen is quite stable when dried from the frozen state. In fraction I, 60 per cent of the protein is pure fibringen while the other 40 per cent is a mixture of globulins, among which is a substance lacking in the blood of hemophilic patients.

June 15 19471

In hemophilia the blood clots very slowly, but if a small amount of normal human plasma, or of fraction I is added, the clotting time is reduced to normal As packaged for use fraction I is distributed in vials containing 200 mg of protein of which at least 120 mg are fibringen which is not what the hemophiliac lacks, while in the remaining 80 mg of protein is the substance which the hemophilic patient needs. A dose of 200 mg may be injected intravenously in 5 cc of solution and will reduce the clotting time of the hemophilic patient as satisfactorily as an injection of plasma or whole blood It has been possible to control hemorrhage in these patients either as a result of trauma or operation with repeated doses of this size given every few hours These results can be duplicated by the infusion of 100 cc. of fresh plasma or blood The chemist has merely separated what the hemophiliac needs from the blood and put it in a convenient small ampule in stable form, so that it will be available for reconstitution and injection when needed 4

The surgical applications of this fibrinogen containing fraction are manifold. It is a natural plastic substance and depending upon the conditions under which a clot is produced a variety of useful products can be prepared for different purposes. Fibrin foam is a very useful hemostatic agent. When dropped in a solution of thrombin pleces of fibrin foam seak up the thrombin which is the active hemostatic principle. Unless the patient has no fibrinogen at all you can always make a clot form if you apply thrombin to a bleeding surface. However, you cannot make the clot stick unless there is a means of applying it with pressure.

If a cotton sponge is applied it must be removed and bleeding is apt to recur but fibrin foam provides a sponge made of human protein which can be left in situ. The material is slowly digested away in the body and in the case of the nervous system where it has been used extensively no serious degree of reaction or adhesion formation results.

In the war this material was extremely useful

in head injuries where the major venous sinuses were torn and patients were having severe hemorinage. Fibrin foam could be packed against the sites of bleeding from these sinuses and left in place. It also makes it possible for neurosurgeons to speed up their work a great deal. Fibrin foam also has been used for hemostasis in general surgery in sites like the liver and as a pack for bleeding sockets in dentistry.

Another product made by forming a fibrin clot under proper conditions is known as fibrin film, which resembles a sheet of cellophane. It, too, can be sterilized by heat so that it is ready for surgical use as soon as it is soaked in sterile salt solution and regains some of its elasticity and strength. Films have proved to be very useful as a substitute for the dura mater which often must be removed in brain operations. It too like fibrin foam, can be left in situ and is gradually replaced by a new membrane without the formation of adhesions to the underlying brain

The antibodies which carry the immune properties of the blood are in the gamma globulin The terms alpha beta and gamma fraction globulins refer to an electrophoretic classification of proteins, based on the speed with which they will move in an electric field because of their Most immune bodies from all species studied have been found to reside in the gamma globulin or slowest moving component of the plasma A solution containing a twenty five fold concentration of the gamma globuling of plasma was the first by product of the fractiona tion process to be developed and used clinically It gives a relatively clear colorless solution which is viscous but can be dissolved and handled read ily in concentrations up to about 17 per cent protein

Chemically this solution contains 25 times as much gamma globulin per unit volume as the plasma from which it came When those antibodies measured readily and present in the blood of most adults, are titrated, we find that the average of those which can be measured most accurately comes very close to the 25 times which it has been possible to concentrate the gamma In other words when 5 cc of this gamma globulin solution is injected, it is equivalent in antibody to 125 cc of whole plasma It does not contain anything not present in the plasma pool from which it came. Measles, at least and probably infectious hepatitis are relatively universal diseases, and therefore, it seems possible to get a relatively uniform product for use in the prophylaxis of these two infections Since from 2,000 to 10 000 bloods went into most of the lots of gamma globulin produced under the Red Cross program individual variations have been eliminated fairly well

When gamma globulin was first tested by Dr Stokes and his colleagues in Philadelphia, its value for the control of measles became quickly the results with gamma globulin been at least as good as those with convales. serum, previously accepted as the best agent the prophylaxis of measles, and as good as se obtained with placental extract, which for iny reasons is less satisfactory than convales-

There is very little to be said for the universal dminstration of gamma globulin to prevent On the other hand, until we get a vaccine against this universal and sometimes quite serious disease, gamma globulin does give us a fairly reliable method of active immunization, by administering globulin in proper dosage after a child has been exposed, a mild attack can be produced which should give immunity without

We also need an agent which will prevent the disease every time we do want to prevent it, for example, in a susceptible mother in the first tra $much \, risk$ mester of pregnancy, a small child with tuberculosis, or a group of children in a hospital ward We have attempted to find out how regularly

we could modify or prevent the disease at will, using gamma globulin in intimately exposed susceptible children. We know that given the type of exposure and the age group with which we have worked roughly 80 per cent of children should Of a group given small doses of gamma globulin (0.02 cc per pound) 76 per cent developed measles, the great majority very develop measles mild cases In other words, approximately 5 per cent of children were kept from having measles Therefore, we feel that the sults are reasonably regular, and it is justifiable o recommend that people try to modify the disby this procedure ease in almost every child as a routine public health measure If large doses of globulin (01 cc per pound) are given to a similar group of children, approximately 80 per cent are protected completely, while the remainder get mild measles, and if a similar dose is used on hospital wards, we get 96 per cent complete protection, is a much higher percentage than in children at home for the simple reason that, if nothing is done in an exposed hospital ward, only 40 or 50 per cent of the children will get the disease in-

stead of the 80 per cent who might at home The administration of gamma globulin is a benign procedure Reactions have been exceednelly intreducer, and we have not observed a mery mireducing, and we make more among 2,000 children who have been followed for at least A comparison was nade in New York City between placental exfour months after injection Ninety children who tract and gamma globulin

received placental extract were poorly protected and experienced a 41 per cent reaction rate, with gamma globulin, 800 children gave less than 1 per gamma Brownin, ooo ommerch Bave 1000 omm r per cent reactions, of which the vast majority were slight soreness at the site of injection Is mild sugue solcuess in one stood of injourned measles? In measles a safer disease than typical measles? In some 55 cases where gamma globulin failed to diminish the severity of the disease, three compheations occurred of which two were severe, one a case of encephalitis, and another a severe case of pneumonia and empyema, due to Staphylococcus In some 500 cases of mild measles where modification was successful, we observed only mounterston was successful, no observed omy one-tenth as many complications, namely, 2 cases of simple offits media In a poks, school where there was an epidemic of measles and of hemolytic streptococcal infection at the same time, the incidence of severe septic infection was six times as high in the control group who had mensles as in the group who were given gamma Two summers ago, Drs Joseph Stokes and globulin and developed the disease

John Neefe demonstrated that gamma globula was effective in the prevention and modificatio In a camp where a Severe nater-borne outbreak occurred, there was 67 per cent incidence of disease compatible with of infectious hepatitis hepatitis, and 45 per cent of the group developed clinical jaundice, whereas in a small group given gamma globulu only 6 per cent developed visible nundice while 21 per cent experienced an illness which was suggestive of the disease results were observed in New Haven by Dr John Paul and Dr W Paul Havens Although this is an important discovery from the military and institutional standpoint, hepatitis is not like measles as it occurs in general practice increase of hepatitis in a family, all the other children do not necessarily develop the disease Therefore, at the moment, gamma globulin is not authorized by the Red Cross for use in hepatitis, because none of us know how to tell physicians to II gamma globulin is prepared from convalesuse it in private practice

cent rather than normal blood, a preparation may be obtained which is much more potent with re-If this is done with scarlet fever, for example (there is roughly ten times a much antispect to a particular antibody ten times as much antitovin in convalescent serum as there is in normal adult serum), convalescent gamma globulin will contain roughly ten times as much antibody as normal gamma globulin load many instances it is unnecessary to bother looking for convalescent serum because a sufficient titer of antibody may be obtained by concentration. ing the gamma globulin from normal serum is the case with measles, for example case of mumps, however, there seems to be go ouse or manys, nowever, there seems to be go evidence that you do not get sufficient antibody in normal gamma globulin solution for a therapeutic effect. The titer by the complement fivation test is very low in normal blood. It comes up to about the convalescent lovel when normal serum is concentrated. If convalescent serum which has a titer equivalent to normal gamma globulin is used as starting material, a globulin solution with a very high titer is obtained. The same process but using the serum of hyperim munized adults, has been used in the case of whooping cough.

June 15 1947)

A study was made in the Army on the use of convalescent gamma globulin from mumps serum on the prevention of orchitus in early cases of epidemic parotitis. In this series 100 patients admitted to the hospital in the first day of mumps, were treated either symptomatically with a 28 per cent incidence of orchitis or in every alternate case with 20 cc of mumps convalescent gamma globulin the equivalent of about 600 cc of convalescent serum. In this group the incidence was reduced to just about a fourth, or 7 per cent On the other hand when 50 cc of normal serum gamma globulin was given the results were equivocal as one would expect since there is so much less antibody in normal serum camma clobulin than in the convalescent ma terial

Any blood program must use whole blood For this, reliable reagents for blood grouping are needed. If bloods of a single group only are pooled and fractionated it is possible to concentrate the agglutinins against cells of the opposite group. Such an isoagglutinin preparation is concentrated sufficiently so that it nots like a high titer plasma making it possible to get accurate typing by the side method in a matter of a min ute to a minute and a half

The final fraction, fraction V, contains serum albumin. The whole program of plasma fractionation was started in order to develop a light compact blood substitute for the Navy for use in place of plasma in aituations where plasma was too bulky for transportation or storage A bottle of albumin containing 100 cc. of 25 per cent solu tion has the camotic effect of 500 cc of plasma This means that in a given weight or given space on a plane, a submarine, or in a pack, it was possible to carry six to seven times as much comotic activity in the form of albumin as in the form of plasma. If a patient is dehydrated and needs fluids to make up this plasma volume you have to get the water from somewhere but it is easier to carry the protein in this form and give the water as salt solution by vein, or as water with salt tablets by mouth

Another advantage of albumin is that it is in solution ready for administration while plasma has to be reconstituted. Albumin is only a such

stitute for blood and most patients who get injured in automobiles or hurt in factory accidents need a whole blood transfusion as soon as possible

Albumin differs from concentrated plasma which may hurt the patient because it is much more viscous than blood whereas albumin is not viscous. Albumin has been used in a consider able number of cases of trauma, hemorrhage, and burns with very satisfactory results, particularly if additional saline solution is administered. Doses of 50 to 75 Gm are needed in most cases, blood should be given before more is administered.

The chief use of albumin after the war will be in cases of hypoprotemenia For example small baby entered our hospital very ill with ascites fluid in the chest, and tremendous edemo due to weeping eczema, secondary infection with the staphylococcus and a poor food intake baby had a serum albumin level of 10 Gm, per cent with a total protein of 30 Gm. per cent This child was a very difficult problem, since the administration of continuous intravenous fluids through its infected skin seemed risky possible to give this child what it would take by injection of 25 cc of concentrated albumin solu tion daily for four days. This was readily infused in a few nunutes. At the end of four days the baby's weight had fallen from 12 pounds to its normal weight of 8 pounds, with disappearance of the edema and a rise in serum albumin to 3.0 Gm per cent At that point the baby began to eat well taking care of his own nutritional requirements This case represents nutritional hypoproteinemia, a type seen more frequently in surgery than medicine In the hypoproteinemin of liver disease albumin is very useful since in cirrhosis the level of serum albumin rises very slowly if at all on a large intake of calones and protein In nephrosis albumin prepared as lowsalt or salt poor albumin using a diluent con taining but one-seventh as much sodium as an comotically equivalent volume of plasma is frequently an effective diuretic agent. However, most of the injected albumin is excreted in the urine there is little change in the serum protein. and the benefits are usually only transient, the edema reaccumulating as soon as treatment is

In summary separation of blood into its functional components makes it possible to accomplish many therapeutic purposes with each donation. For example eight pints of blood may beused as whole blood, so necessary for the treatment of shock, or separated into their components. If all eight are made_into plasma, four-500-cc units of dried plasma and two liters of ţ

fractionated, one obtains two 25-Gm bottles of albumin, several packages of blood grouping globulins, twelve 5-cc vials of gamma globulin, several packages of fibrin foam and film, an excess of thrombin, and, ultimately, we hope, a number of other useful products. Thus the process of plasma fractionation has given us a number of valuable therapeutic agents, whereby we can take advantage of the particular properties of the various plasma proteins which enable them to perform their specific functions.

In addition, it has given us important tools for the study of disease—It has been possible to do things which could not be done with whole blood By giving albumin it is possible to raise the patient's serum albumin level in a way you never could with plasma, and by that means we have learned a lot about the control of water balance in liver disease, and we are learning something about nephrosis in which albumin, incidentally, is probably not the answer to the problem

How, as doctors, are we going to get these therapeutic agents? They were developed in the war for the Army and Navy but not for civilian use, although certain surplus products, dried plasma, and gamma globulin, are being distributed by the Red Cross It looks as though they might come in three ways The products of plasma fractionation are commercially available today, prepared from the blood of paid donors However, that has certain drawbacks The cost

of this process is not so much in the manufacturing as it is in the price of the blood and its collection and in the price of distribution of the final product. Those are much more than the cost of manufacture, so that commercial products are good but expensive

Another possible way is for the Red Cross and the state to cooperate in collecting blood from volunteer donors, then to turn it over to a commercial laboratory for processing to final products for distribution by public agencies like state and local health departments In Massachusetts and Michigan, the Red Cross is cooperating in getting donors, blood is collected by the states, processed in the states' own laboratories, and it is planned to distribute whole blood, resuspended red cells, plasma, albumin, gamma globulin, and the whole range of blood derivatives at public It is to be hoped that various types of programs will be developed in different parts of the country, each best suited to the facilities and needs of the area

COMPREHENSIVE POSTGRADUATE COURSE IN RHEUMATIC FEVER AND RHEUMATIC HEART DISEASES

A comprehensive postgraduate course in rheumatic fever and rheumatic heart disease will be held at St Francis Sanatorium for Cardiac Children, Roslyn Long Island, New York, July 14 to July 25

The course, which will consist of informal lectures and discussions, supplemented by examination and study of patients demonstrating all clinical phases of rheumatic disease, is designed to give intensive training in the diagnosis and treatment of rheumatic fever and rheumatic heart disease

The daily schedule will be 9 00-10 00 AM,

Lecture, 10-12 Noon, examination of patients, 1 00-3 00 PM, informal discussion and review of cases, 3 00-4 00 PM, roentgenography and electrocardiography, and 4 00-5 00 PM, demonstration of laboratory procedures

The icc for the course is \$75 and the attendance is limited

For further information, address Rev Mother Superior, FMM, St Francis Sanatorium for Cardiac Children, Roslyn, Long Island, NY

THE USE OF TRIDIONE IN THE TREATMENT OF CONVULSIVE DISORDERS*

DONALD J SIMONE, M D New York City

(From the Departments of Medicine and Psychiatry Cornell University Medical College and New York Hospital)

A NEW drug 3 5 5-trimethyloxazolidine-2 4-dione (Tridione), has been offered for the treatment of petit mal sensures. It was originally studied bocause of its analgesic properties. Then it was observed to have an almost specific action against petit mal. We have had an opportunity to use the drug in 15 patients over a nine months period but the effects are so dramatic and definite that a brief report on the action of this new preparation is warranted.

Material

The present report concerns 15 patients 7 patients had petit mal seizures, 5 had grand mal seizures, and 3 had fits of other types

The patients with petit mal seizures ranged in age from four to eighteen years of age. The duration of the illness varied from twenty two months to twelve years. The age at the time of onset varied from four to nine years.

A petit mal seizure is defined as a momentary loss of consciousness It occurs suddenly without There is no outery The patient does not fall and usually does not drop what he has in his hands. There is no tonic phase and there are no clonic movements or tongue biting continence of urine is rare. There may be flick ering of the closed evelids at the rate of 3 per There may be some movement of the second ins. Attacks measured by the electroencephalograph last from a fraction of a second up to about thirty five seconds averaging about twenty seconds Each attack begins and ends abruptly No abnormal neurologic signs can be elicited during or after a fit. There are no sequelae The subject returns to full consciousness without disorientation fatigue or headache encephalograms in all cases show the typical three a second alternating dart and dome seizure pattern described by Gibbs Davis, and Lennox 1 2

Most of the patients in this group had been treated with phenobarbital and/or Dilantin with variable and generally unsatisfactory results in the reduction of frequency of attacks Some had shown an appreciable reduction with use of 25 mg of ephedrine sulfate twice a day

Tridione is supplied in rather large capsules each containing 0.3 Gm of the white crystalline

chemical The drug was administered in 0.3 Gm to 0.9 Gm doses, three times daily before meals

Four of the patients with grand mal had seizures of unknown origin. The duration of the illness varied from one to twenty three years. The age at the time of onset varied from twelve to twenty years. There were no focal aspects to seizures in any of these patients. The fifth patient land jacksonian seizures affecting the right side of the body, without loss of conscious-

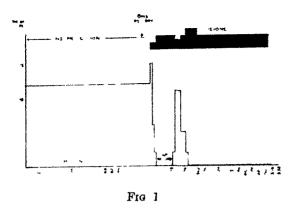

The other 3 patients had abnormal electroencephalograms. The seizure manifestations were quite individual and they are described in the case reports.

Results

All of the 7 patients with petit mal experienced a reduction in the number of attacks within two weeks Some became attack free within twenty four hours One patient (Case 5) who had averaged ten attacks daily for a year had an attack of grappe and omitted the drug for my days There was no recurrence of the sergures This is in accord with the during this period subsequently reported observation of Lennors who found that when the drug was omitted sersures did not return during the course of a three months' period of observation. Six days is admittedly an inconclusively short period of time yet considering the previous frequency of the patient sattacks ten a day and the fact that febrile infections commonly increase the frequency of fits the failure of the attacks to recur is the opposite of what might be expected and is therefore noteworthy

Two complications were observed ** In doses of 0.6 Gm, three times daily an eruption may develop about the mouth and chin and over the chest and back. This rash is indistinguishable from acne vulgaris. Patch tests with the drug have been negative. A biopsy of a skin lesion showed folliculitis. Withdrawal of the drug did not bring about the disappearance of the crup-

^{**} I am indebted to Dr. Frederick Reiss of the Department of Medicine (dermatology) and to Dr. John M. M. Lean of the Department of Surgery (ophthalmology) for observations and interpretations of the skin and ye symptome

tion Six of the 15 patients experienced this complication

The second complication was "misty" or "foggy" vision, or "glare" which occurs in bright One patient feared to cross the street because she felt that she could not see an approaching automobile through the "mist," and another dropped her wrist watch at her feet and was unable to see it even when it was pointed out This "glare" disappears as soon as the intensity of light falling upon the eye is reduced below the critical level In only one instance was the phenomenon associated with pain the presence of this symptom, which can be reproduced by exposing the patient to a frosted light bulb of sufficient wattage, examination of the pupillary responses, the fundi, the visual fields, and the visual acuity showed no defects It would appear that the drug produces a defect in visual adaptation to light, a function of the Six of the 15 patients had this comretinal rods plication Three had both complaints

It was possible to repeat the electroencephalograms in 7 cases All of them showed a definite change for the better though all but one were still abnormal.

The results in the 5 patients who suffered from grand mal seizures were poor. One patient became attack-free when taking Tridione in combination with Dilantin and phenobarbital (Case 10). Only one patient was definitely improved while taking Tridione alone (Case 11).

The results in the 3 patients who suffered from psychomotor seizures were likewise poor One of the 3 was slightly improved

Conclusion

From these observations it may be concluded that Tridione is an effective drug in the treatment of petit mal seizures and that it is ineffective alone against grand mal and psychomotor seisures

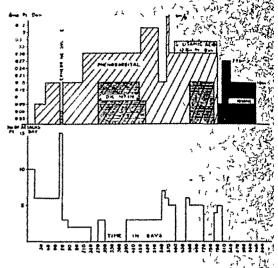

Fig 2

Case Reports

Petit Mal Seizures—Case 1—B H L (girl, born December 11, 1940) began to have attacks in January, 1944 Attacks occurred on days when the patient had nasal congestion and ceased with the development of fever—A typical attack exhibited loss of consciousness, starting with slight rotation of the eyeballs upward, and some twitching of the eyebrows—They lasted about five seconds and often terminated with a sigh—She would sometimes go on with what she was doing or saying before the fit, at other times continuity was lost.

Neurologic examination revealed no abnormalities. No attacks occurred between May, 1944, and January, 1945 With a return of nasal congestion in January, 1945, attacks recurred. This time they lasted ten to twenty seconds, and exhibited flaccidity although the patient fell only once. Frequently incontinence occurred during an attack, There was never any warning or tonic manifestation Between January and September, 1945, the patient had from 10 to 80 attacks each day with an average of 12 a day according to the observations of her. mother, a skilled observer (Fig 1) During the first three days, when the patient was taking 0.3 Gm of Tridione, she averaged 15 attacks a day During the next four days, attacks averaged six a day with none on one day. During the second week, 06 Gm were given daily, attacks dropped to The patient became less tense, none in four days less irritable, and less overactive, her disposition was milder and sweeter The attacks were shorter, less conspicuous, and showed less flaccidity Following this there was an increase in the frequency of attacks which averaged six to ten a day with a range Dosage was increased to three capof none to 18 sules a day (0 9 Gm.) with an immediate drop in frequency to an average of two a day and a subscquent drop to an average of one a day with frequent. periods of no attacks in four consecutive days? There have been no attacks since January 13, 1946 No side-effects of the drug have been noted ***

Case 2—A. D (girl, born December 1, 1927) began to have attacks at the age of seven years (1934) In these she "became blank and her eyes stared." They occurred at the rate of three to ten times a day

There was no family history of fits Neurologic examination was unremarkable. The patient was a somewhat shallow forward girl of average intelligence An electroencephalogram revealed three scirures in a five-minute resting record when the patient was taking phenobarbital. These seizure patterns showed few darts. Taking 60 mg. of phenobarbital, three times daily seizures occurred at the rate of five a day Because of an alveolar infection phenobarbital was omitted for a few days "Almost constant seizures ensued. Upon return ing to phenobarbital, attacks were reduced to none in three days to two a day (Fig 2) When 0 1 Gm of Dilantin, twice daily was added to the phenobar bital a period of several weeks ensued without an attack. Attacks then recurred at the rate of one to four times daily. It became necessary to stop Dilantin because of severe gingivitia, slight unsteadi ness and impairment of school grades. Attacks averaged about five a day and she experienced 'dizziness which she thought replaced attacks Glutamic acid had no effect on the attack rate

Phenobarbital was gradually reduced and 0.3 Cm. of Tridione exhibited. Sixty two attacks were noted in the first two weeks. The dosage was in creased to 0.0 Cm and she has now been free from attacks for three and a half months which is the longest free period since the onset of her illness. The patient developed an acneiform eruption over the chin, forehad back, and chest.

She complained also that upon exposure to bright light her eyes hurt and that there was a white mist in front of everything Examination by Dr John M McLean showed marked retraction, blepharospasm, and epiphora. The visual acuity and the pupillary reactions were not impaired. The fundi were negative This reaction was considered typical of photophobia

Maile the patient was taking Tridione and was attack-free a ten-minute continuous electroencephalogram showed no seisures this is in contrast to the occurrence of three seisures in five minutes when the patient was taking phenobarbital and eight exisures in nine minutes when she was taking ephenoirine sulfate. Overbreathing educed a big build-up of three a second waves but no dart and dome's solrure patterns occurred. This is in contrast to seven dart and dome seisures in a previous recording.

In this 18-year-old girl with true petit mal Tridione has entirely stopped the seisures.

* * The author is indebted to Dr H G Wolff for per

mission to report this case:

† The term dart, introduced by Lennox (J.A.M.A. sp.

† The term dart, introduced by Lennox (J.A.M.A. sp.

ct.) is used in this paper to describe sharp-pointed waves

whose beas is 2 mm. or less in width, and the term spike

is used to describe blunt-pointed wavres whose base is greater

than 2 mm. The dart is commonly associated with a symmetrically freed, dome-shaped three cycles per second wave

while the spike is causily associated with an asymmetrically

formed wave which is often slower than three cycles per second.

Dart and dome sequences are common is cryptogram

petit mai. Spike and wave sequences, which were not often

seen in any of the patients reported here occur according to

Lennox.!

Grand Mal Sexure—Case 3—8 J (man, born December 27 1923) had his first grand mal sexure in January 1943 one week before induction into the Navy Attacks were not characterized by sura or outery. There was 'slight twitching of the muscles of the body' and drodling of saliva from the mouth. Tongue biting and incontinence did not occur. He was tired but had no headache after a fit. Sometime after this, he had several attacks of loss of consciousness lasting a few seconds. These episodes were preceded by a 'faint feeling' with nausca. He is said to have talked right through one such attack. A second grand mal fit occurred in December 1943. In subsequent fits (1944) he has been incontinent of

A sister had convulsions in childhood. There was no history of head injury or of fits in the patients infancy. Neurologic examination was unremarkable. An electroencophalogram showed a high incidence of five a second waves occurring singly, and in groups in all leads. Overbreathing was abnormal.

À physician prescribed 0.2 Gm. of Dilantin daily which reduced the frequency of minor seizures to three or four attacks per week for two weeks with none for three weeks and then a return of attacks From September 1944, to January 1946 careful count of his attacks was kept. While taking phenobarbital, 30 to 60 mg three times daily, and Dilan tin 0.1 Gm three times daily, he averaged one attack overy ten days some of these attacks were only aurae

During January 1946 the phenobarbital and Dilantin were gradually reduced over a three-week period, and 0 6 Gm. of Tridione, three times daily was given During this period he felt poorly his attack rate jumped to one every four days and the attacks were more severe Phenobarbital, 60 mg. three times daily was added to the Tridione 0 6 Gm. three times daily during the escond month with a reduction in the number of attacks to one in five days. He developed a marked papular eruption on the face and he complained of a strange taste in his mouth. He felt very tired and could not keep up with his school work.

Tridione did not help this young man who suffers from cryptogenic grand mal major and minor sersures.

Psychomotor Seizure -- Case 4 -- G M born November 23 1918) began in August 1945 at the age of 27 to have momentary periods of loss of orientation for place. These occurred about twice a week during August there were none in September there were two in October In November he had an attack while visiting his mother. He realized that something was wrong with him but he could not tell exactly what it was He recognized people and places but seemed unable to grasp what was taking place On the way home he stopped off to see a friend who advised him to make a note of his own name address, and the fact that he had paid him a When the patients wife came home, she found him resting on his bed. He wakened spontaneously and said that he might have had a dream he could not be sure. The note was found and verified This experience lasted about five hours

After this, attacks occurred about twice daily, lasted sixty to minety seconds, and were characterized by amnesia for the events of the preceding half hour. In the fifteen to thirty minutes following the attack, he would recover practically all of the events of the amnesia period. Occasionally, the amnesic period was of several hours' duration. There has never been any warning. He has never fallen down. There have been no tonic or clonic manifestations. Except for the amnesia, which really constitutes the attack, there were no sequelae. Since the onset of the illness, he has had more difficulty in thinking and he seems to himself "mentally duller" than formerly. He complained of being prone to sleep.

There is no family history of fits, and the patient had no fits in infancy — There is no history of head injury — An inventory of neurologic signs and symptoms was unrevealing — Neurologic examination was

negative

An electroencephalogram showed not infrequent six a second waves and there were some four a second waves in the frontal areas. There were occasional spindles in the parietal leads where slow waves were rare. The occipital leads showed very occasional six a second activity. Overbreathing educed considerable slow activity in the frontal leads. The patient was considered to have psychomotor seizures.

Tridione, 10 Gm, was administered three times daily before meals. In the first eleven days, the patient had only four attacks (instead of two a day) and during one week was free of attacks. A second

electroencephalogram taken on the eleventh day of Tridione showed none of the parietal spindles. Slow waves were present in the frontal areas as before. The frontal and parietal leads showed outbursts of irregularly formed higher than average amplitude six and seven a second waves. There was no response to overbreathing. The record was considered to show a definite improvement over the first test.

Because the patient complained that in strong light "everything looks overexposed," the dosage was reduced after the eleventh day to 0 6 Gm, three times daily. During the second month, the number of attacks was about half what it was before he started taking Tridione, and his amnesia cleared much more quickly. Attacks now left him "spent" Phenobarbital, 60 mg, three times daily, was added to the Tridione, 0 3 Gm, three times daily, without significant change in the frequency of attacks.

It appears that this young man who suffers from psychomotor attacks was only slightly benefited by Tridione and that the addition of phenobarbital to

Tridione was also ineffective

Tridione used in this study was supplied by the Abbott Laboratories of North Chicago Illinois

NEEDS OF NURSING SERVICE TO BE STUDIED

A study to determine the basic needs of nursing service was approved recently by the National Nursing Council The Carnegie Corporation of New York will provide funds with a grant of \$28,000 The study will be directed by Dr Esther Lucile Brown, Department of Studies in the Professions, Russell Sage Foundation It is expected that the study will be completed in six months

Preceding approval of the study, 19 young professional nurses from hospitals and health centers throughout the country concluded a nine-day workshop on April 25 The workshop was devoted to

evaluation of present-day nursing services and the immediate need for thousands of additional nurses of several types. The approach, however, was on the basis that it is not economically sound to prepare all nurses with the same basic curricula and outline of experience. The workshop examined the variation in abilities of those now called registered nurses and found that present and future demands for different types of nursing service call for a relatively small number of professional women in nursing and for a greater number of nurses prepared at less expense and in a shorter period of time

BONE BANK

Establishment of the nation's first "Bone Bank" to provide a constant supply of bone for frageting operations has been announced Dr Leonard F Bush, head of the George G Geissinger Memorial Hospital, Danville, Pennsylvania, revealed establish-

ment of the bank at the hospital in a talk before the New York Academy of Medicine's Orthopedic Section

SCLEROSING THERAPY OF VARICOSE VEINS WITH SOTRADFCOL (SODIUM TETRADECYL SULFATE)

SOLR HIRSCHMAN, M.D. New York City

(From the Hospital for Joint Diseases)

IN A previous paper "Sclerosing and Surgical Treatment of Varicose Veins" published in the NEW YORK STATE JOURNAL OF MEDICINE March. 1946. I pointed out the value of the combination of injection therapy with high ligation of the saphenous vein and tributaries Combination of ligation with injection therapy in my opinion is advisable not only because of the obvious mechanical factors involved but also because of the limitations of the sclerosing agents used at the present time. In discussing the agents used for injection therapy. I emphasized in the same paper that those which have to be used in high concentrations e g sodium chloride, sodium suli cylate are very poorly tolerated causing excruclating pains and cramps. They must be used in high concentrations because they are mactive sclerosing agents in greater dilutions. Some of the more potent agents have been found to be too

The soap-type sclerosing agents which are most generally used at the present time have the most all round desirable properties even in the concentrations and doses in which they are now being given they are not sufficiently effective in producing obliteration Originally sodium morrhuate was used in a 10 per cent solu tion and produced excellent obliteration but at the same time many untoward reactions were observed some of them fatal The concentrations of sodium morrhunte had to be decreased to 5 per When used in this dilution, recanalization occurs frequently Even when this dilution and small volumes are used as I advocated side reactions such as mentioned above and local perivenous inflammation are not infrequently en countered

My associates and I have therefore been searching for a more potent and less toxic selerosing agent. After a thorough pharmacologic investigation we instituted a clinical study of the material described below and this paper constitutes a report of the results obtained in 300 cases treated without ligation and 131 cases treated with ligation and injection.

Sodium tetradecyl sulfate is a synthetic compound having the following formula 2 methyl 7-ethylundecyl-sulfate-4

It also has an MW of 316.4 Its pharmacology has been investigated by Reiner who I believe, was the first to attempt a quantitative comparison of the sclerosing effects produced by various agents used

for this purpose therapeutically By measuring the average length of obliterations produced by solutions of different concentrations, he arrived at what seems to be a rational measure of the potency of sclerosing agents By this method sodium tetradecyl sulfate was found to be about three times as effective as sodium morrhuate Moreover if it was injected subcutaneously it proved to be almost free from producing inflammatory reaction within twenty four hours which, with other agents sometimes results in an alisseess.

The toxicity of sodium tetradecyl sulfate by in travenous injection is about the same as that of the sang-type selerosing sigents. Freedom from nutror enous material and from material of natural origin (allergens) raised in us the hope of having found an agent which is not likely to produce untritoid reactions. Obviously the local inflammatory reactions produced by the scape are in part due to high alkallinty. Sodium morrhante solutions usually have a pH of 9–10 * whereas sodium tetradecyl sulfate has a pH of 7 6 which is close to that of blood and tissue fluids. These properties, together with a relatively low toxicity and high potency in sclerosing action made the clinical investigation of this product of interest.

One per cent 3 per cent, and 5 per cent sterile buf fered solutions of sodium tetradecyl sulfate containing also 2 per cent benzyl alcohol were used.* Their physical appearance is much superior to that of the scap-type sclerosing agents inasmuch as they are water-clear transparent and nonviscous. The rela tive viacosity of sodium tetradecyl sulfate 5 per cent was found to be 1 55, while sodium morrhuste has a viscosity of 1.77 times that of water. Because of their low surface tension and low viscosity the solutions are readily miscible with blood, producing plus and minus uniform distribution of the material after injection The specific gravity of the solution is I 007 which is an advantage over the concentrated sait and dextrose solutions, as it safeguards the set tling of the solutions by gravity and provides uniform distribution throughout the injected area

At the clinic we ran several series of cases where we gave injections of sodium morrhuate sodium chloride 20 per cent or sodium richoleate in one leg and sodium tetradecyl sulfate in the other. On comparison we noted that the side injected with sodium tetradecyl sulfate showed a stronger adher ent thrombosis of the veins that more of those veins and tributaries were thrombosed than with the other solutions that the cosmetic effect was better and the discoloration was less. There were no irritations inflammations sloughing or systemic reactions. After a total of 5 341 injections, there were no side.

^{*} Supplied by the Research Department of Wallace & Tiernan Products, Inc.

reactions or allergic manifestations. Another noteworthy observation was that, unlike using the soap solutions, some of the patients resumed treatment, following a temporary cessation of several weeks, without any unfavorable reaction.

Sodium tetradecyl sulfate may be administered in either 1 per cent, 3 per cent, or 5 per cent solutions. At the clinics, we used the 1 per cent in the superficial veins, in burst flares, and telangiectatic lesions, The 3 per cent and 5 per cent solutions were used in the thick tortuous varicosities, the dose usually being from 1/2 to 1 cc for each injection. Several areas may be injected at the same time, not to exceed 3 cc totally. The needles used varied from 22 to 25 mm gage, ranging from 2/4 to 5/5 inch. In the spider veins, bursts and flares, a 26-mm needle was used. These facilitated firm anchorage and prevented leakage.

It is very important to remember in the injection treatment of varicose veins that once the operator pierces the skin and enters the vein, the syringe and the needle must at all times be kept steady in order to avoid perivenous infiltration After the solution is injected, the needle is withdrawn, the puncture compressed with gauze impregnated with alcohol and strapped with adhesive

These patients were observed carefully at each admission for the past eleven months. Those injected with sodium tetradecyl sulfate showed no more canalization or recurrence of any varicosities. They were asked whether they experienced any pain following the injections, or if they had any untoward reactions, but their answers were negative. Three hundred patients were treated by injections alone, and 64 have had unilateral saphenous ligation with subsequent injection

therapy to one or both legs Sixty-seven have had bilateral saphenous ligations with subsequent injection therapy A total of 5,341 injections were given with no unfavorable reactions

Summary

- 1 Sodium tetradecyl sulfate (sotradecol) is an effective, soothing sclerosing agent
- 2 A small amount of sclerosing fluid is sufficient in the injection treatment
- 3 There is no reaction or urticarial manifestation with sodium tetradecyl sulfate
- 4 The thrombosed clot is more firm and adherent than that which is obtained with sodium morrhuate 5 per cent, or sodium ricinoleate
- 5 There were no recurrences and recanaliza-
- 6 Sodium tetradecyl sulfate (sotradecol) is a clear transparent, nonviscid solution, with a low surface tension which is readily miscible with blood and provides a uniform distribution following injection
- 7 The toxicity is much less than sodium morrhuate or sodium ricinoleate
- 8 Sodium tetradecyl sulfate, according to our clinical studies, is, to date, the most satisfactory sclerosing agent

PUBLIC HEALTH SERVICE TO GIVE GEORGIA CHILDREN BCG TO FIGHT TUBERCULOSIS

The United States Public Health Service has disclosed that Columbus, Georgia had been selected for a long range study of BCG vaccination for tuberculosis, widely used in both Europe and South America

The plan is to start the United States study, which will require several years, with school children, both Negro and white, paying especial attention to those highly subject to exposure to tuberculosis. Only children who show through tests that they have not previously been infected with tuberculosis germs will be vaccinated.

The Columbus program will be carried out in cooperation with state and local health authorities Permission of parents will be obtained prior to vaccinations

The vaccine for the Columbus experiment will come from the BCG laboratory at Cook County Hospital, Chicago

Its production is a joint undertaking of the Public Health Service, the University of Illinois College of Medicine, and the Chicago Municipal Tuberculosis Sanatorium.

ANDROGENIC ARREST OF FAMILIAL ENURESIS*

A Study in 75 Children

I NEWTON AUGELMASS M D Ph.D Sc D New York City

TNINTENTIONAL and unconscious di urnal or nocturnal discharge of urine may be a Mendelian recessive trait. It occurs in the absence of local or systemic disease in one or more children of the same family with a predecessor's history of enuresis in childhood While the symptom may clear at maturity, the adult remains subject to urmary frequency, urgency, and nocturia despite unwillingness to admit it. This lack of bladder control is a behavior pattern usually inherited from the affected parent or grandparent whose lower half of the body the child favors, irrespective of sex or social status The familial defect is observed in about one third of patients with urmary incontinence after the third year of life They rarely fail to wet the bed night after night, year after year, without being awakened by the incident. Some have such urgent and frequent desire to empty the bladder that their clothing becomes wet during periods of nervous tension and cold weather by day and regularly during the night in spite of intelligence or training The others remain constantly wet with offensive decomposing urine, day and night no matter what therapy is instituted.

Urination is a reflex not involving the muscula ture of the bladder, spinal centers, and the efferent and afferent nerves. Any local or systemic disturbance interfering with this regulatory mechanism will inhibit the process even during sleep. Various attempts have been made to determine the nature of these disturbances inside and outside this reflex are without considering the degree of maturity of the urogenital structures for the arg of the child

Nature provided an elaborate mechanism for regulating so simple a function as emptying the bladder. In a sense it works like a combination safe whose purpose is not so much the opening of the bladder or safe at the proper time, but of preventing its being emptied at some other time. The combination of nerve impulses involved in bladder control in the normal child responds to training and will in the presence of adequate maturations of the urogenital mechanism.

In enuress the infantile condition persists with the detrusor muscle holding mastery over the sphincter Disparity between the innervation of the two sets of muscles allows the detrusor normally held in check by the sphincter to overcome the comparatively weak action of the latter But enuresis clears spontaneously at puberty when sexual maturation strengthens the action of the sphinoteric mechanism. Trousseau¹ attributed functional enuresis to an irritable bladder Cana² demonstrated an immaturity of the musculature. Hoffman² attempted to improve it development by anterior pituitary like hormones. Schlutz² succeeded with male sex hormone in a random group of enureties. We have found this immaturity to be especially applicable to child dren with familial enuresis. While the condition clears by adolescence, the affected child is still subject to urinary frequency, urgency, and nooture a sex and the sex

A child over three years of age who has never learned to control his bladder is evaluated for local irritation from foci in the genitourinary tract or adjacent structures, i.e., urologic malformation cystitis, calculus vaginitis, balanitis intestinal parasites, anal polyp or fissure, or for systemic organic dysfunction, i.e., spina bifida occults, epilepsy, brain or cord lesion, diabetes mellitus or insipidus, allergic disease intercur rent infection neuropathic personality, or mental retardation. The vast majority of cases are functional in origin, devoid of organic disease of the urogenital or nervous systems. They suffer from familial tendency, emotional conflict, or improper truining

Seventy five normal children of familial enu retics, with and without emotional and training difficulties, were studied since 1940 because they failed on all forms of therapy Boys predom: nated in this group (3 to 1) probably because of their greater difficulty in learning bladder control. They actually go through two successive trainings first sitting down, then standing up Treatment consisted of methyl testosterone 10 to 30 mg daily, in divided doses for one to three months If oral administration produced no significant improvement within a fortnight, it was supplemented by intramuscular administra tion weekly of 10 mg of testosterone proprionate Fluid intake was restricted throughout the day except for milk morning and noon, cracked ice between meals and rusing of the mouth with water to quench thirst

Mothers were advised to remain unemotional about wetting episodes because parental anxiety has an untoward influence on the child's psyche If the maternal bond has been sufficient the child's resolve to please his mother will permeate

TABLE 1 —DISTRIBUTIONS OF FAMILIAL ENURETICS
TREATED WITH ANDROGENS

Age	s	ex	—Effec	t of Treatn	nent
1 ears	Boys	Girla	Failed	Improved	Cured
4-8	24	8	3	6	23
8-12	14	5	2	2	15
12~16	18	6	1	2	21

the deeper layers of his mind and lead to better control of the nervous mechanism of the bladder. With insufficient desire to please his mother, the child is concerned with his own comfort and empties the bladder when tension causes the slightest discomfort. In the series studied the situation was explained to both mother and child to establish better decorum between them

Most children were anxious to cooperate after years of wetting, shame, and embarrassment The androgenic material gave them more confidence and less anxiety about bladder control Indeed, some of the associated emotional disturbances eased with improvement Nocturnal enuresis diminished in both frequency and urgency in from three to ten weeks, but diurnal enuresis was more resistant, requiring months to clear in four cases. Until such improvement became manifest, the child was awakened once or twice during the night to youd. As the condition

cleared, testosterone was diminished gradually and fluid intake resumed slowly without return of the symptom for six months to one year in the cases reported. Each child was informed of the nature of his infantile difficulty, the method of attaining his bladder control, and the need for assuming complete responsibility for his body behavior to make him master of a mature function.

Conclusions

Fifty-nine normal children with familial enuresis were cured by oral administration of methyl testosterone or intramuscular injection of testosterone proprionate for a period of three to ten weeks. Ten children were improved in fifteen weeks but six failed to benefit from this form of therapy.

CONSERVATION DEPARTMENT REPORTS FIRST RABID COYOTE IN NEW YORK STATE

The first coyote with rabies in New York State was reported recently by the Division of Conservation Education, State Conservation Department, in an announcement to the press While the presence of coyotes in the State is not new, the statement points out, the positive identification of a rabid animal of this species was of special interest to the

Department because of its rabies control campaign among foles. Coyotes, according to the announcement, have been introduced into the eastern United States partly through the transportation of young animals by tourists and partly by what seems to be an eastward migration of the species—Health News, April 21, 1947

OCULAR FINDINGS IN ONE HUNDRED AND TWENTY EIGHT IUVENILE DIABETICS*

Isadore Givner, M.D. and Catherine Lodyjensky M.D. New York City

A OPPORTUNITY was had to study oph thalmologically 128 children with diabetes practically all under insulin control, at a camp of the New York Diabetes Association Not withstanding the fact that only one examination could be made on most of the cases and no follow-ups were obtainable, the retinal findings were of sufficient interest to be noted. All cases were studied under I per cent paredrine hydrobromide cycloplegic instillations after complete physical examinations, including urinalysis, had been done.

The group included 34 children between the ages of 5 to 10 and 94 between the ages of 10 to 19 Seventy-eight had known diabetes one to five years, 44 five to ten years and ten children had had diabetes from ten to sixteen years

Interest and speculation in the project was stimulated by the following statements in the literature. Duke-Elder' states that patients under 40 are exceptional with diabetic retinopathy He further says there is no demonstrable relation between the severity of the diabetes and the extent of the retinal changes for they are not seen in young subjects in whom the diabetes is most frequently accentuated The youngest case a 22-year-old patient to whom he refers is that of Adams 2 Moore' concluded that diabetic retinitis does not occur under the age of 35 McKee⁴ does not list his 2 360 cases of diabetes by age but states that of 96 consecutive cases of the last 1 000 from 6 to 31 years of age 92 were nega tive 1 was hypertensive and 3 had retinal hemor Of the entire series, only 105 had retinal Waite and Beetham's studied hemorrhages 297 juvenile diabetics under the age of 20 found no hemorrhages under the age of 10 and in the 10 to 19 age group they constituted 0.8 per cent

In regard to lens changes Waite and Beetham found flocculi cataract in 4 per cent of their juvenile diabetics. In half of the cases in which diabetic cataract occurred the diabetes was poorly controlled. In the present series only 3 showed retinal changes.

Case Reports

Case 1 -S L agirl, agod 12 had known diabetes

* From Camp NYDA of the New Y rk Diabetes Association Inc.

for eight years. Her blood pressure was 96/60 albumin was + in urine.

The right eye was negative, the left eye had one small pinpoint hemorrhage near, but not in juxtaposition to a perimacular vessel inferior to the fovea. Connected with the terminal point of an adjacent capillary was an aneutysmal dilation its connection with the vessel helped differentiate it from a hemorrhage as did its sharp demarcation.

Case 2—R. E. a boy aged 15 had a known duration of diabetes for eleven years. The albumin was negative and his blood pressure was 110/70

In the right eye there was one ancuryamal dilation of a capillary in the macula region. In the left eye there was one small purpoint hemorrhage

Case 5—A I a boy, aged 15 had a known dura tion of diabetes for nine years with the albumin + and blood pressure 120/82.

The right eye had two pinpoint hemorrhages the left eye had one pinpoint hemorrhage and one dilated capillary

Case 4.—D B a girl, aged 15 had had a known diabetes for seven years. The mother and brother were known diabeties. There were typical subcapsular opacities of diabetic cataracts in each cyt. Albumin was + and the blood pressure was 118/78. The fund as well as could be seen, were negative

Comment

In discussing the findings three aspects are worthy of consideration

1 What is the relationship if any of the duration of the disease to retinal findings?

2 What is the relationship if any, of albuminum and diabetic retinopathy?

3 What does one find histologically in early diabetic retinopathy?

In regard to the first question, Waite and Beetham concluded that deep retinal hemorrhages in diabetes multiply with age and multiply with the continued duration of diabetes out of proportion to the age factor but they show no obvious correlation with sclerosis of retinal vessels with vascular hypertension with renal disorders with maulin dosage or with blood sugar or calcium levels Dolger states that when 200 patients below 50 years of age were followed dilligently for twenty five years, not one escaped retinal hemorrhages, albuminuma, and/or hyper tension in varying degree. His group included 16 whose age of onset of diabetes was below 10 years and 30 whose onset was between 10 and 20 years He states that retinal hemorrhage is the predomi-

TABLE 1

Age Group		Visible Fundi		Deep Hemorrhages	Percentage of Fundi			
_	NYDA	Walte and Beetham	NYDA	Waite and Beetham	NYDA	Waite and Beetham		
Under 10 years 10 to 19 years	68 188	130 464	5	4	2 6	0 8		

nant lesion and often precedes the appearance of albuminuria and a hypertension

It would seem, therefore, that the duration of the diabetes is the determining factor in retinal hemorrhage, and that the latter, since it is frequently the only lesion found, is probably the earliest manifestation if one does not differentiate pinpoint hemorrhages and aneurysmal capillary dilations

In regard the second point, Gray found that 49 out of 66 cases of definite diabetic retinopathy were consistently without albuminuma Garrod,8 on the other hand, argues that the clinical absence of albumin may be transitory or may be associated with pathologic changes in the kidney Dolger believes that the presence of albumin in diabetics is commonly found in patients having normal urea nitrogen and that the cause of albumin in the urine is changes in the Lidney comparable to that observed in the retina He has stated that 50 per cent of patients with retinal hemorrhages of diabetic origin have albuminuma

Of the 128 cases of diabetes in this study, there were only 4 that showed any albumin 4, 2 showed retinal hemorrhages, 1 an incipient diabetic cataract, and 1 case was without eye changes There was 1 case of retinal hemorrhage without albuminuma

Credit is due Ballantyne, who noted "the appearance of minute globular aneurysms in the retinal arteries usually discovered singly or in small numbers within or near the macula area The occurrence of these micro-aneurysms in such a situation, and without other changes in the fundus, we believe to be the earliest unequivocal sign of diabetes The aneurysms are situated in the inner nuclear layer and are globular distensions of the capillaries which form a link between the first capillary plexus in the ganglion cell layer and the deeper plexus situated at the outer boundary of the inner nuclear layer, that is, the aneurysms are situated between the precapillaries on the arterial side and those in the venous side of the retinal circulation "

Summary and Conclusion

In a routine fundoscopic examination of 128 diabetic children, 3 were found to have retinal hemorrhages and 1 a diabetic cataract none of the patients had complaints referable to vision, and since the importance of retinal hemorrhages in regard to a better evaluation of the case has been emphasized, it would seem good medicine to study every diabetic patient under a Special emphasis should be put on mydriatic pinpoint hemorrhages and aneurysmal capillary dilations as they can be overlooked easily, unless the picture is constantly kept in one's mind

BETTER CASE-FINDING URGED

Case-finding methods for mental illness are in the horse-and-buggy stage, Dr Robert H Felix, chief of the Mental Hygiene Division of the US Public Health Service, charged at the Jewish Board of Guardians' annual meeting

He urged that we begin to think of broad case-finding programs and of developing mass used case-finding technics comparable to those 11, April Times, for tuberculosis —Better 1947

EXPERIENCES IN INFANT FEEDING WITH THE ADMINISTRATION OF A CEREAL CONTAINING PAPAYA FRUIT*

ELIZABETH J ITTNER, M D, Brooklyn, New York

(From the Department of Pediatrics Long Island College Hospital)

FOR the past year the Department of Pedi Tatres at Long Island College Hospital has used a multigrained cereal which contains 50 per cent dehydrated papaya fruit and 50 per cent grain by weight. In our experience it has been highly satisfactory and we believe that it has certain advantages over other types of cereal

A digest of the manufacturer's description of the product follows "This multigrain cereal is precooked and fortified with papaya powder"

An analysis of the powder shows

	Percentage
Moisture	150
Ash	56
Fat	08
Protein	64
Other carbohydrates by difference	59.3
Crude fiber	8 6
Pectins (alcohol precipitated)	4 3

This powder exhibits a proteolytic enzyme activity. In a mixture of 2 Gm. of papaya powder and 100 cc of fresh cow's milk incubated at 60 C for four hours, approximately 50 per cent of the total nitrogen is converted to nonprotein nitrogen.

The taste and physical properties of papaya powder are similar to those of apple powder Papaya powder readily absorbs water and so acts in the intestinal tract. This tends to correct constination

Methods of Study

This study was begun in August, 1945, and continued to September, 1946 All infants cared for in the Well Baby Clinic were given papaya cereal as the first solid food and it was advised that it be continued at least until the time of discharge from the clinic at twelve months of age

A dietitian advised the mothers as to methods of preparation and the manner of feeding. The usual directions were. The desired quantity of cereal should be mixed with sufficient heated formula to make a thin paste. This mixture should be offered twice a day before the formula feeding. The mothers were encouraged to taste the preparation and advised against the addition

of sugar or other ingredients. A supply sufficient for four weeks was given at each clinic visit

Observations were recorded as to (1) general health, (2) weight gain, (3) appetite for the cereal, (4) the presence of diarrhea or constipation before the cereal feeding was begun and the subsequent incidence, and (5) unfavorable effects such as diarrhea vointing, skin cruptions etc.

Our results were as follows Of 751 cases studied, 289 were observed in the Well Baby Clinic and 462 in the wards of the Long Island College Hospital We observed that the general health and weight gain was that expected of the average normal infant Only 2 patients of all those observed refused the cereal Ton patients who had manifested diarrhea before Cerol* was given showed prompt improvement after this addition to the diet Fifty four out of 62 patients who had constipation improved after Cerol was fed to them. No unfavorable effects were noted Following the introduction of Cerol to the feeding schedule, particular attention was paid to diarrhea, voniting, and skin eruptions.

Two hundred and eighty nine cases were carefully studied in the outpatient department Home visits were made by a nutritionist to observe the methods of preparation and the patients reception of the food. These visits were made to homes of patients of all economic levels The mothers were of widely variable grades of intellectual capacity It was found that all prepared the food easily, and were enthusiastic over the infant's appetite for it Only two mothers had failed to continue its use Most mothers who had other children volunteered the informa tion that they had fed the cereal to them with success and asked for an additional supply to enable them to continue to do so

In addition the cereal was used in the wards of our hospital All patients admitted to the children's medical ward and the children's surgical ward from May 1 to September 1, 1946, who required cereal received papaya cereal (un less specific request for other cereal was made by the attending physician) We observed, and the nurses reported, that the cereal was enthusiastically received and well tolerated by both infants and children Many of these children had histories of dislike for cereal so that little had been taken at home

^{*} The material for this study was supplied by John Wyeth & Brothers, Iuc., Philadelphia, Pennsylvania.

The entire hospital experience was favorable. there being no instances of diarrhea, vomiting, or The observers were cautioned skin eruptions particularly to record any and every instance

Constipation was not a problem in the group of children studied by us Sixty-four patients who previously had been constipated were relieved soon after the initiation of Cerol feeding Only 3 per cent of the group studied complained of constipation after Cerol was started our impression that the entire experience with Cerol disclosed an unusually low incidence of constipation for patients of this age group rough check, some 60 patients' charts were taken at random from a private pediatrician's files Forty per cent of this group had notations on

their records which indicated constipation f lowing the prescription of the usual cereal foo Even though the group compared is small. ! marked contrast suggests that the addition papaya is of decided value in the reduction constipation during early cereal feeding

Conclusion

This study of 751 infants and children indica that papaya is a valuable and palatable addit to the cereal introduced into their diet Ben the customary effects on general health: weight gain, there was almost uniformly g appetite for this type of cereal, virtually no stipation, and no instance of diarrhea, vomit or skin eruption

BIRTHS CONTINUE HIGH-INFANT AND MATERNAL MORTALITY REACH NEW LOW

Compared with the first three months of 1946. births in the first quarter of 1947 increased by 51 per cent The birth rate was the highest since 1918, while deaths decreased by 3 per cent Infant mortality reached a new low level, entirely because of A reduction in deaths among babies under one month

Maternal mortality has also never been lower Ten years ago, when the birth rate of New York State declined to the lowest point on record, it was observed that "if the downward trend continues the State will soon approach a demographic equinovi when the birth and death rates will just balance—the threshold of a decreasing population "* However with an improvement in economic conditions, the birth rate was temporarily stabilized and then moved upward, the new trend being accelerated by the upsurge in marriages which followed the outbreak of the war The departure of hundreds of thousands of young men for service overseas was reflected in a decline in births, but upon the termination of the war the rise was resumed. The number of births recorded in March of the present year was greater by 10,000 than in the same month a year ago and the rate, 24 1 per 1,000 population has not been equally high in almost thirty years. In the twelve months April, 1946, to March, 1947, births reached the exceptionally high total of 316,000, exceeding the deaths recorded in the same period by 164,000

The death rate in March was 11 5, practically the

* Annual Report, New York State Department of Health 1936 Vol II page zm

same as the minimum recorded in the two precedi vears

Infant mortality, 30 deaths under one year I 1,000 live births, was the lowest for the month

A remarkably favorable record was established maternal mortality 7 deaths per 10,000 live a stillbirths—less than one-half the rate a year a Of special interest is the fact that for the first tim month has passed without a single death from ab tion In March of last vear there were 6 such deat

AN ATTEMPT TO UNIFY THE CURRENT THEORIES OF RENAL LITHIASIS

RALPH U WHIPPLE, M.D. FACS Rockville Centre New York

A FEW years ago I had occasion to remove a voung woman's kidney containing several calculi. Upon section of the organ a rather cur ious condition was noted within one of the papillae, which was seen to be honeycombed with a network of small cells and each cellule con tained a hard, smooth dark-green, oval calculus As the situation was unique in my experience, I was stimulated to turn to an investigation of the pertinent literature. Before long one's interest is certain to be caught by Randall si-4 keen observations including his supposition of an initiating lesion in the collecting tubules of the renal papilla.

A few months after this first experience my enthusiasm was forcefully revived by another in tensely interesting renal specimen Scattered throughout the substance of all the papillae were seen small specks of yellow, hard material which made a grating sensation when cut. The long axis of these deposits was parallel to the collecting tubules, and they were distributed in a fanlike manner converging toward the papillary tip Clinging to the surface of one papilla was a much larger deposit which more appropriately might be called a calculus With moderate resistance the latter was freed leaving a shallow papillary ulcer Here again it would seem that Randall's theory emerges into the foreground

It might be fitting at this time to review briefly my impression of Randall's theory pothesizes that there must be a preclinical initiating lesion in the collecting tubules near the papil lary tip This lesion originates as a definite trauma to the lining epithelium of the tubule and as such the cells may pass through the various phases of cell proliferation degeneration necrosis and desquamation, or in vitamin A deficiency kera tinization. The occurrence of this localized con dition acts as a midus for calculus formation, and in so far as most calculı require months or possibly years to reach clinical proportions, they seem to find the necessary fixed habitat in the basement membrane of the damaged collecting tubules Should any of these subspithelial plaques erode through the papillary surface, they are in a favor able ate to be constantly bathed by the calvecal urine. Chemical analysis of calculi show them to be mainly composed of the salts commonly present in the urine Once in the environment of the calvecal urine the calculus grows through the deposition of successive layers of crystallized salts. Eventually the calculus reaches such proportions that its very weight, acting through the

forces of gravity, tears it free from its bed to travel forth into the realm of a clinical entity. This mechanism is essentially similar to type I as described by Randall. His type II mechanism differs in so far as the salt deposition occurs within the lumen of the tubule and is thought to be due to a hyperexcretory state of the unne, that is to say, a supersaturated solution.

If we look at the kidney as a whole, it is fair to assume that like any other body tissue it is meant to function normally within relatively fixed ranges In other words, the excretory prod ucts should not exceed a certain physiologic limit Should the concentration of any excretory product exceed its normal physiologic range, it would be considered pathologic and as such serve as a tissue irritant The point of maximum concentration of any of these irritants logically would seem to be placed in the terminal collecting duct or duct of Bellini Here then, we have the maximum concentration of a tissue irratant in the terminal collecting tubule where it can produce an asentic cellular necrosis leading to Randall's initiating. precalculus lesion The sequence of events to the stage of a clinical calculus has already been noted

Let us digress for a while to reflect upon this theory in the light of anatomic facts age kidney possesses about ten papilla and each papilla carries 20 to 30 terminal collecting duets The number of collecting tubules supplying each terminal duct has been variously estimated Some place the number of structural units involved per terminal duct at 120 others state the collecting ducts bifurcate to the twelfth order which would mean slightly over 2 000 units per terminal tubule On the other hand the average kidney is said to contain 3 000 000 to 4 500 000 glomeruli. Mathematically, one could compute therefrom a minimum of 10 000 nephrons or a maximum of 22 500 nephrons for each terminal collecting duct. Just ponder for a moment the amount of stress and strain placed on each duct of Bellini even granting the supposition that not all glomeruli function simultaneously

On the physiologic side of the problem Richards states that the function of the kidney is to maintain a uniformity of internal fluid composition. It is well known that many useless and harmful substances are carried away in the glomerular filtrate. At the same time this filtrate also contains several required substances such as water, inorganic bases, diffusible foodstuffs and so on, which nature has tried to conserve through a

process of active, selective reabsorption in the convoluted tubules As a result, the waste products of metabolism and other remaining foreign substances reach the collecting tubules in Again we see that the a concentrated state terminal ducts are not only responsible for a heavy load, but also that this heavy load is concentrated with potentially irritant materials In the light of these facts it is a wonder that we all do not suffer from repeated attacks of colic As a matter of fact, Anderson, after a careful microscopic study of the pyramids of 168 diseased kidneys, concludes that practically everyone contains these preclinical deposits

It might be well at this point to examine some of the more common current theories to see how they may be adapted to the single, unifying theory herein proposed Probably the least complicated example is that of the hyperparathyroid patient in whom there is a pathologic mobilization of calcium and phosphorus urine approachs the collecting tubules, it becomes supersaturated with these chemicals and thereby they assume pathologic proportions and as such are tissue irritants Flocks has pointed out that acidification, an acid-ash diet, and vitamin D therapy serve to mobilize additional calcium, and by that means intensify the entire process through further tissue irritation The case of the bedridden patient is quite similar No matter whether the prolonged immobilization is due to trauma, poliomyelitis, a cord injury, or some other equally debilitating condition, excessive skeletal demineralization occurs, producing pathologic amounts of calcium in the terminal collecting ducts and the modus operandi for epithelial damage

Restricted fluids, an unfavorable pH, or any other physical condition facilitating precipitation of salts will readily produce a situation compatible with the unifying theory Let us examine the renal complications which may result through the failure to use proper supportive therapy when employing the sulfonamides Antopol, as well as others, states that in the absence of sufficient fluids and proper alkalinization large amounts of the free sulfonamide compounds will precipitate in the collecting tubules near the papillary tip In rats an ensuing degeneration of the collecting duct epithelium followed by considerable calcification has been demonstrated The calcification may be nature's way of attempting to repair the tissue damage previously wrought

If we accept the theory of a necrotized epithelium in the collecting tubules as the necessary precalculus lesion, we would like to be able to detect this nidus in all stones. Then let us turn to Becke, who states that all calculi have a matrix of fibrin-like material. Carrying this thought a little further Thompson asserts that small amounts of nitrogen are consistently found in all calculi. It would seem to me that the presence of a fibrin-like matrix, as well as nitrogen in all calculi, indicates the universal existence of organic material. What could be more fitting that to ascribe this finding to its most likely source, the degenerated epithelium of Bellim's duct?

How does the problem of infection conform to the unifying theory? First, there are few who will disagree with the statement that a pure pyelitis as an entity is merely a fleeting and hypo-Pyelitis per se is always assothetical state ciated with a pyelonephritis to a greater or lesser By direct extension from the pelvis the first point of assault logically would be the terminal collecting ducts Second, if bacteria or bacterial products such as toxins are filtered through the glomeruli, their point of maximum concentrations, after selective tubular absorption has taken place, brings us back once again to the terminal collecting ducts Should the local infection produce systemic symptoms such as pyrexia and fluids are not forced, a condition of dehydration will result in further concentration of the tissue irritants and at the same time the mechanical factor of washing away these substances will be less evident

Moreover, if the infection is supported by urostasis, the above-mentioned influences are accentuated and quite likely, as in the sluggish colon, there is superimposed an additional means of concentrating the urine by virtue of a slower drainage and a greater fluid reabsorption in the renal units If Barney⁵ is correct in his statement that 74 per cent of urmary infections possess urea-splitting qualities, we have in the ma-Jority of cases a calyceal urine supersaturated with alkaline salts just looking for a nidus to which they may become fastened For those of you who subscribe to the colloid-crystalloid balance theory, we must also concede that infection can alter the colloid with a resultant upset of the balance in favor of crystalline precipitation

By this time it should be clear to all how the unifying theory can accommodate the current hypotheses offered to explain the occurrence of renal lithiasis For fear of creating boredom I shall barely mention the potentialities of other less widely held theories There are some who believe that vitamin A deficient diets are stone producing The answer would be that an insufficiency of this vitamin produces changes in epithelial tissue leading to cellular necrosis or keratinization, especially in the urinary tract Need I state that this fulfills our requirements for producing an initiating lesion? Similarly, monotonous diets may lack vitamin balance Stones occurring in the dry tropics may be due largely to a supersaturation of the urine in the terminal collèbeting tubules produced by the dehydrating effect of the climate. Likewise those ulcer parties to an alkaline regimen who develop calculing do so through a supersaturation or hyper excretory mechanism. In summation all these situations seem to eatisfy our primary initiating lesion theory. This theory also welcomes Vermooten seem to eatisfy our primary initiating the south African negro by virtue of the fact that his diet is simple stable rich in vitamin A, on the acid ash side, and low in calcium, all these factors protect the terminal duct epithelium.

Conclusions

In order for a renal calculus to form we should expect the following events

1 An initiating lesion in the epithelium of the terminal collecting tubules of the kidney

2 The production of this lesion through the presence of pathologic proportions of unnary salts, bactora, or toxins which per se serve as tissue irritants

3 The initiating lesion serves as a nidus for stone growth only when bathed by a highly sat-

urated calveeal urine

4 And, last, since not all initiating lesions are favorably placed for growth through accretion, many potential calculi may take years to grow or may actually never reach clinical proportions. Hence nature has spared a good number of us the agonies of renal colic.

URGE WIDER USE OF RADIUM FOR ASTHMA TREATMENT IN CHILDREN

Treatment of 34 asthmatic children with radium proved to be so encouraging that three Baltimore physicians urge more extensive use of this new type of therapy in the April 12 issue of the Journal of the

American Medical Association
The physicians—Arthur T Ward Jr., Samuel Livingston, and Dean A Moffat from the departments of otolaryngology pediatrics, and allergy division of the Medical Clinic, of the Johns Hopkins University School of Medicane and Johns Hopkins Hoppital—state that 15 patients were completely relieved of astimatic attacks five children were relieved to such a degree that they have only an occasional mild attack three children showed mod crate improvement and 11 have obtained no relief

The 34 patients were all under 14 years of age They were chosen for this study because they had recurrent attacks of asthms and masses of adenoid tissue in the nasopharyux (the back of the mose) Twenty four children had a family history of allergic disease and 18 children had allergic manifestations beades their asthmatic symptoms

All of the children received complete physical examinations The first attack of asthma in 22 of the 34 children was precipitated by a respiratory in-

fection for example a common head cold, tonsillitis pneumonia or the respiratory infections which are so often a part of the contagious diseases of childhood.

In 16 patients attacks developed after exposure to the common inhalants—house dust and animal danders or orris root and the common pollens.

Treatment of each child consisted of applications of radium to each side of the nasopharyms once each month for an average of four treatments. The immediate effect of the radium on the respiratory tract differed in these children Many complained of sneezing and nasal discharge for 12 to 48 hours after the exposures. In a number of children asth matic symptoms developed several days after the first or second radium treatment and the attacks were occasionally severe.

In conclusion, the authors state that the "object of this report is to arouse interest in this new form of therapy so that its larger use may prove and extend the true value that we consider evident from the results of this detailed study and from experience with hundreds of cases not included herein."—American Medical Association Veirs April 10

SENSORY POLYNEURITIS

A Common Postgrippal Syndrome

EDWARD HOLLANDER, M.D., New York City

(From the Manhattan State Hospital)

URING the past year I have seen 23 cases in which the complaint was deep, aching sensations in one or all four extremities tients presented a uniform clinical picture of sensory polyneuritis without involvement of motor nerves In the lower extremity, the discomfort was most frequently localized in the region of the metatarsal bones and less frequently in the muscles of the foreleg and thigh wise, in the upper extremity, the complaint was usually about the metacarpal bones and only occasionally in the muscles of the forearm and The sensation was described as intense soreness such as after a severe contusion porary relief was obtained by gentle massage and by certain movements of the affected limbs numb or heavy feeling with paresthesias was present in 3 cases In 2 patients, in addition to aching sensations in the left leg and thigh, pain was felt in the left lower quadrant of the abdomen, and the course of the left tenth dorsal nerve was hyperalgesic *

All the cases, regardless of which limb was affected, presented a "glove and stocking" zone of hypalgesia in all the limbs, with diminished thermal sensation The sensation of touch was slightly altered and was described as a rough or ticklish feeling in the hypesthetic zone Deep pressure over the region of discomfort elicited tenderness The reflexes were normal and muscle power was unaffected The "glove and stocking" zones of diminished sensation were symmetric in both upper and both lower extremities (Fig. 1) No other abnormal findings were present in the routine physical and laboratory examinations

Pain sensation was tested by moving a long pin along the extremity with uniform moderate pressure and marking the point when it was felt "sharper" or "more painful" on the anterior, posterior, and both lateral surfaces This method of determining the level of a hypalgesic zone is more accurate than the use of pin prick, as the pressure employed is more uniformly controlled Thermal sensation was tested with test tubes containing hot and cold water applied above and below the hypalgesic zone. Touch sensation was tested by the application of a piece of cotton twirled to a point

In 17 of the 23 cases an attack of grippe (severe or mild) occurred one to three weeks prior to the

complaint In two of the remaining cases, the fauces was congested without local symptoms. The high incidence of grippal infection prior to the onset of the complaint in the majority of the cases is highly suggestive of a causal relation. No

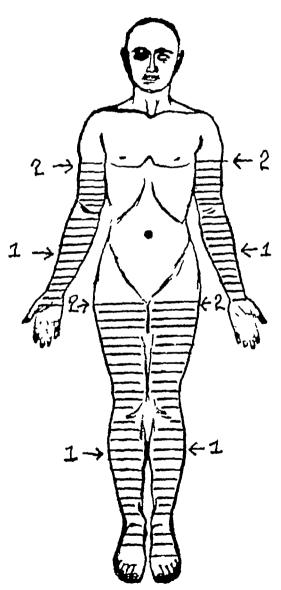

Fig 1 (1) Indicates the usual lower level of diminished sensation symmetrical on both sides (2) Indicates the usual upper level of diminished sensation symmetrical on both sides

other cause of the polyneuritis was found, such as contact with heavy metals, unbalanced diet indulgence in alcohol, or pregnancy only the sensory nerves were involved in these cases, while other forms of polyneuritis practically always involve both motor and sensory nerves

One should be alert to the existence of this sensory form of polyneuritis, since most of the patients had been incorrectly diagnosed as hav ing rhoumatic infection fallen arches, and arterio-

acleratic disease

The treatment employed included salicylates or phenacetin for relief of pain. Thiamin chloride (100 mg) was injected once a week and six capsules of betalin compound (vitamin B complex) were given daily In 16 cases the symptoms were relieved and the glove and stocking" zones of hyperthesia disappeared after two to four weeks Two cases which failed to respond to this regimen cleared up after three weeks of injections of 2 cc of crude liver twice a week. The remaining 5 cases did not report for follow up examination.

Conclusions

- A syndrome is described of "sensory polyneuritis' causing aching in the lower or upper extremities associated with 'glove and stocking' zones of diminished sensation to pain, tempera ture and touch in all the limbs without involvement of any motor nerves.
- Occasionally a lower dorsal nerve is also affected causing pain in the abdomen
- The condition is preceded by a grippal in fection in the majority of the cases
- Treatment with vitamin B or crude liver for a few weeks is effective

MORE THAN 18 000 NEW CANCER CASES REPORTED UPSTATE IN 1946

At least two out of every 1 000 persons in New York State developed some form of cancer in 1946 according to a report compiled recently by Dr Morton L. Levin director of the Department s Division of Cancer Control During the past year 13,616 new cancer cases were reported to the Division by physicians hospitals, tumor clinics, and laboratories throughout the State, except New York City where cancer is not reportable. Detailed reports on cancer cases in each city of 10 000 or over and in each county have been made available to district health officers and to city and county health commissioners.

Physicians reported the disease as 'early' in 27.2 per cent of the cases and moderately early' in 37.4 per cent. More than half 55 per cent was in women and 45 per cent in men Seventeen per cent of the women and only 9 per cent of the men were under forty five years of ago. There were 113 cases reported among children under fifteen years of age

The type of cancer which occurred most frequently in men was cancer of the skin and lip Next in frequency were cancer of the prostate, stomach large intestine rectum, bladder and lung Cancer of the breast was the most frequent type in women, followed by cancer of the uterus skin and lip large

intestine ovary stomach and rectum.

It is noteworthy, Doctor Levin commented, 'that the most common forms of cancer in both men and women are among those that are cariest to dis-cover early and to treat successfully. There were al-most 5 000 cases of these types of cancer alone Prompt attention to early symptoms should result in early diagnosis and a high percentage of cures in the majority of these cases

Among early symptoms he listed a persistent growth or sore on the skin or lip a single lump in the breast abnormal or unusual uterine bleeding persistent indigestion, continued hearse-ness unusual changes in bowel habits, abnormal bleeding from any body cavity

The need for intensifying efforts toward early

diagnosis and treatment through public education is

self-ovident .- Health News Way 19 194"

^{*} Since this article was submitted. I have found this ayn-"Since this article was submitted. I have found this syndrome of senary polyneurities associated with sensory disturbances in other nerves, which subsided with the disappearance of the objective findings in the cartemities. (1) hyperajecial of the first lumbur nerve with complaint of particles of the fifth dorsal nerve with complaint of presortial pain, not aggravated by reservious and with normal electrocardiograph (6 cases) (3) "burning sensition of the tip of the tongue without glossific (lingual nerve) (2 cases)

ANEMIA IN INDIGENT BLOOD DONORS

IRWIN S ESKWITH, MD, and ROLF S KROLL, MD, New York City

(From the First Medical Division, Bellevue Hospital, and the Department of Medicine, Columbia University, College of Physicians and Surgeons)

DURING the past few months, a number of instances of rather marked anemia have been seen in the First Medical Division of Bellevie Hospital in patients who have been making frequent blood donations. Since this condition is not mentioned in recent reviews of the subject, ¹ ² a brief report of its seems warranted.

Table 1 gives the essential data in fourteen such cases. In addition to the examinations of the blood, all had blood urea nitrogen determinations. These were within normal ranges. Ten had one or more stool specimens negative for occult blood by the benzedrine method. Hemoglobins were done with the Sahli hemoglobin-ometer. Other relevant data are given in the table.

It is interesting to note that none of the patients were admitted with a diagnosis of anemia per se. For a time the cause of their low hemoglobin was missed. However, once it was realized that these patients had been donating blood frequently, it became a routine to question all anemic patients on this point.

These patients show certain common features All were men, indigent, unemployed, or unemployable. They were all residents of either municipal lodging houses or cheap Bowery hotels. Eleven were chronic alcoholics. They donated blood, in one pint quantities, either to blood banks in hospitals, or to commercial companies manufacturing blood products. The small sums they received, five dollars a pint, were usually spent not on food, but on the purchase of more alcohol.

Six patients had, as their primary diagnosis, lobar penumonia, and one had the diagnosis of bronchopneumonia. There was one fatality in this group a patient admitted quite ill who became comatose shortly after admission. The diagnosis at death was lobar pneumonia. He had given twelve transfusions in four months.

One patient (Number 9, O J) (see Table 1) was seen in consultation on the surgical service, for an opinion as to his cardiac status. His dyspnea and orthopnea were relieved as his anemia improved by iron therapy. Two other patients were admitted with cardiac complaints. One (Number 6, F. J.) had definite arteriosclerotic heart disease.

It is probable that the frequent blood donations of these patients, their poor food and iron intake.

and their chronic deficiency states were responsible for their anemia These patients were, in many instances, donating blood when they were already anemic For example, patient 2 (F W) had given 23 transfusions in twenty-four months, the last one three days before admission hemoglobin on entry was 40 Gm per 100 cc of Patient 11 (Q T) was one of three admitted with a diagnosis of cardiovascular discase. He had given ten transfusions in twelve months, the last one nine days before admission His initial hemoglobin was 50 Gm that he had continued to donate blood after the onset of dyspnea and orthopnea His symptoms cleared with iron and supplementary vitamin therapy

Some of these cases, such as patients 9 and 14, had given no blood for three months, but, nevertheless, had failed apparently to regenerate hemoglobin. In view of other negative findings, one may assume that poor diet and chronic deficiency disease were responsible for this failure.

Discussion

The effect of frequent blood-letting on the hemoglobin levels is disputed Bryce and Jakobowicz³ found that hemoglobin levels in men donors remained constant if transfusions were given not more than once every three months

In a short communication, Brewer⁴ states that frequent donations do not depress the hemoglobin levels On the other hand, Santy⁵ has reported anemia, responding well to iron, in professional donors

Fowler and Barer⁶ did hemoglobin determinations on professional donors at a university hospital Their donors were medical students, residents, or hospital employees. They found that the hemoglobin fell 2 3 Gm per 100 cc after a 500 cc transfusion. It took an average of forty-nine and six-tenths days for the hemoglobin to return to normal. Twenty-five per cent of the donors had not returned to normal levels at the end of eight weeks. These results were obtained in a presumably well-nourished and healthy group, hardly comparable to our patients.

Snapper, Liu, Chung, and Yu⁸ found microcytic anemia, clearing with iron administration, among Chinese professional donors. They attributed the anemia to their poor dietary regimen

ADMISSION OF GENERAL PRACTITIONERS TO HOSPITAL SERVICES

The Joint Committee for the Coordination of Medical Activities of the A.M A expressed concern at a recent meeting that the growing tendency to exclude the general practitioner from hospital staff privileges is having the effect of making it impossible for the general practitioner to obtain the advantages of modern hospital facilities for treatment The Joint Committee therefore of his patients recommended that a long range program be formulated on the part of all professional bodies con-The immediate need, the Committee felt, was the integration of general practitioners into the hospital staffs throughout the country. To accomplish this the Committee recommended that the Council on Medical Education and Hospitals of A M.A. develop, as soon as possible, several alternate plans The Committee further recommended that the American Medical Association and other professional organizations, as well as the hospital associations in their regional and annual meetings and in their publications, give prominent place to a

discussion of how this hospital staff integration can best be accomplished in order to make available for each eligible physician and his patients all the facilities provided in the community for medical care

The House of Delegates in December, 1946, passed a resolution to the effect that all hospitals should be encouraged to establish general practices, stating that appointment to a general practice stating that appointment to a general practice. tice section shall be made by the hospital authorities on the merits and training of the physician Copy of this resolution has been sent to all hospitals in the country by the Council on Medical Education

and Hospitals Further, complying with House of Delegates directive of December, 1946, the Section on General Practice of Medicine has given serious consideration to the plan for the formation of a certifying board, and such a plan will be proposed to the Section in June The Joint Committee does not believe that the cetting we are the continuous board. believe that the setting up of a certifying board for general practice will meet the need at this time

A LA CARTE

A little restaurant near my office is a favorite spot " among physicians in the neighfor "coffee and borhood One day a group of us noticed that Willie, the counterman, was doing a lot of fidgeting Between times he would scratch his posterior on the corner of the counter

Several of us tried on-the-spot diagnoses, but came up with as many answers as there were M D's present Finally I asked "Wilhe, have you got hemorrhoids?" Pointing to the bill of fare, he answered, "Just what's on the menu, Doctor"—MD, ILLINOIS-Medical Economics, May, 1947

EVALUATION OF ANGINAL PAIN IN THE VARIOUS STAGES OF CORONARY ARTERY DISEASE*

Particularly the Premonitory Phase of Coronary Occlusion and Infarction without Occlusion

HARRY L JAFFE, M.D. HARRY HALPRIN M.D., 201d LYLE M. NELSON M.D., New York City

IN RECENT years numerous advances in our knowledge of coronary heart disease have emphasized the diversity of this disease and the madequacy of the classic syndromes of angina pectoris and coronary thrombosis to embrace the various phases of the disease Correlation of clinical, electrocardiographic, and pathologic observations has enabled us to understand and classify many cases hitherto labeled atypical as is not unusual following the introduction of new concepts the terminology employed by various authors is not uniform, a circumstance leading to some confusion The importance of this subject has been pointed out by one of us previously and a classification of coronary artery disease was presented 1. The application of this classification is illustrated in this paper

The major recent contribution to this field has been the demonstration of myocardial infarction or necrosis without acute occlusion or thrombosis of a coronary artery 2-6 The infarction occurs us a result of myocardial ischemia and is frequently associated with some factor inducing a severe degree of coronary insufficiency e.g. effort emotion shock with fall in blood pressure acute hemorrhage heart failure tachy cardia aor tic stenosis 1-6 In other cases a precipitating factor is absent, which is the rule in coronary occlusion with infarction Postmortem the infarction is found with rare exceptions to consist of focal disseminated areas of necrosis in the subendocardial region and papillary muscles, and thus differs from the infarct in coronary occlusion which is usually confluent and extends from endocardium to pericardium 135 These pathologic differences probably explain the disparity in the electrocardiographic alterations in the two conditions In coronary occlusion with infarction the electrocardiogram exhibits RS-T elevation, Q-waves, and reciprocal relationship between leads 1 and 3 There is progressive RS-T change into T wave inversion which is usually longstanding In infarction without occlusion RS-T depression and T wave inversion may be present angly or in combination in one or more leads. The changes show considerable variation and disappear by the end of several weeks as a rule. Although the two conditions may be similar clinically, they can be differentiated electrocardiographically in over 90 per cent of cases. These views recently have received some confirmation indirectly in experimental studies. 14

Angina may arise as a result of acute coronary insufficiency under the following conditions (1) transitory myocardial ischemia, the classic recurrent brief angina of effort, this is a physiologic disturbance unaccompanied by acute changes in artery or muscle or by residual changes in the electrocardiogram following the attack, (2) severe or protracted myocardial ischemia, usually with infarction but without coronary occusion as described above, (3) acute occlusion with complete myocardial ischemia and infarction, the acute attack is often preceded by a premonitory period of recurrent pain of varying degree.

Diagnosis on the basis of the type and dura tion of pain alone often fails to reveal its true While the infarction following acute occlusion characteristically is accompanied by severe pain and other symptoms these may be mild and of short duration and the diagnosis missed unless an electrocardiogram is taken. In infarction without occlusion the degree of pain is even more variable, it may be minimal or very severe In the course of a longstanding anginal syndrome some of the attacks may be severe and protracted, although electrocardiographic changes or other evidence of myocardial necrosis are absent The following two cases demonstrate the importance of the electrocardiogram in evaluating "angma pectoris" and illustrate the premonitory phase of coronary occlusion and the possibility of preventing the latter

Case Reports

Case I—W H. L., No 280530 a man, aged 49, was well until two months prior to his admission to the hospital At that time he began to complain of substernal oppressive pain radiating into the neck and both forcarms, on exertion Cessation of effort afforded prompt relief The singinal syndrome in creased in frequency and he was admitted to the U.S. Naval Hospital St. Albans New York,

The work reported was done at the U.S. Naval Hospital St. Albana, New York, while the authors were in military service.

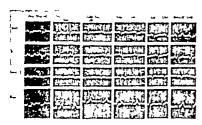

Fig. 2 Myocardial infarction without coronary occlusion July 28 IAD RS-T1,24 depressed T1 low July 28 RS-T depressons less marked T1 higher, T2 isoelectric, T3 semi-inverted July 30 (r.u.) T1 2 3 diphasic July 30 (r.u.) T1 upright, T2 isoelectric, T3 more inverted Aug. 7 RS-T1,2 depressed T1 lower, T2 3 diphasic Sept 20 Normal record (transverse heart)

Blood pressure was 100/70 Repeated sedimenta tion rates were normal Five months later follow ung an upper respiratory infection, he experienced several bouts of substemal pain relieved by nitroglycerin Examination failed to reveal any cardiac abnormalities. The blood pressure was 100/70

On admission the electrocardiogram (Fig. 2) precented marked RS-T depression and T wave lower ing indicating myocardial ischemia. These changes showed considerable variation during the following weeks and the electrocardiogram returned to nor mal approximately four weeks after the cessation of the pain. They reappeared transiently five months later when there was a recurrence of angina.

Discussion

Since both patients recovered we are unable to offer final evidence, but the course of events in these cases was probably as follows In Case 1 the abrupt onset of a persistent progressive an ginal syndrome, at first on effort, later at rest represented the prodromal stage of acute coronary occlusion which occurred several months later During the premonitory phase there was probably subintimal hemorrhage with progressive formation of a thrombus and gradual occlusion of the lumen of the coronary artery * 10 This resulted in increasing coronary insufficiency and subendocardial infarction with episodes of pain, waxing and waning RS-T depression and T wave inversion in varying leads of the electrocardiogram, and a very abnormal sedimentation rate When the occlusion became complete (October 13), resulting in massive, through and through infarction, the pain was severest and collapse The electrocardiogram abruptly asensued sumed the typical pattern of coronary occlusion with posterior infarction i o Q2,3, RS-T2 3 elevation T1 became inverted suggesting anterior infarction in addition As is usual following coronary occlusion there were characteristic residual changes after many months

Case 2 also began suddenly with a severe anginal syndrome and transient, recurrent RS-T depression and T-wave inversion in the electrocardiogram indicating acute coronary menticiency with myocardial ischemia. In view of the revents and frequency of the attacks for several days, it is likely that there were some areas of infarction in the myocardium as in the premonitory phase of Case I The process came to an end after three days when the pain ceased and the electrocardiogram remained entirely normal, although RS-T depression could be reproduced after exercise. At no time did the electrocardiogram exhibit any of the changes associated with coronary occlusion, i.e., Q-waves and RS-T clevation Five months later the patient had a brief recurrence of coronary insufficiency with several attacks of pain and RS-T depression in the electrocardiogram. There was probably no necrosis at this time This episode followed an upper respiratory infection but what factor suddenly precipitated this man a original status anginosis can only be conjectured. It is not unlikely that the process of sclerosis in the coronary arteries was progressive and that his increased activity during the previous month, to which he was unaccustomed had overburdened his coronary system and produced myocardial ischemia. It is also possible that as in Case 1, the sudden onset was associated with a subintimal hemorrhage. In this case it was resorbed and did not lead to formation of a thrombus Such hemor rhage is a common spontaneous occurrence in diseased coronary arteries and may cause temporary decrease in the lumen of a coronary artery

It is evident that the term angua pectors is essentially descriptive and that pain produced by coronary artery disease may be similar in the various phases of that disease. It is therefore, incumbent upon the physician to exercise thoroughness and caution in evaluating the anginal syndrome particularly when there is a sudden onset or abrupt aggravation of a proexisting one, with the superimposition of angina at rest.11 Serial electrocardiograms and recording of the temperature, blood count, and sedimentation rate may reveal evidence of acute myocardial ischemia with infarction, necessitating bed rest In addition, a sudden anginal syndrome may be the harbinger of a coronary occlu During this premonitory phase the electrocardiogram may also indicate myocardial ischemia as in Case 1 but frequently remains unaltered up to the time of complete occlusion when the typical pattern of coronary occlusion with infarction appears. The recognition of impending coronary occlusion is of considerable

practical importance in view of the recent studies indicating the value of anticoagulants, such as dicumarol and heparin, in diminishing the incidence of mural thrombosis following coronary occlusion ¹² It is possible, as experimental studies suggest, ¹³ that institution of such therapy during the premonitory phase of coronary occlusion may prevent the thrombosis from becoming complete. It has been shown ³ ¹⁰ that the commonest mechanism of formation of coronary thrombosis is subintimal hemorrhage with secondary endothelial changes and superimposed thrombosis. The process may take several weeks or, as in Case 1, even several months, for completion.

Experience has shown that bed rest does not prevent the occlusion although it may mitigate its effect. Therefore, in the presence of a sudden and persistent anginal syndrome, it may be beneficial not only to put the patient to bed but also to investigate the prothrombin activity and, if indicated, administer dicumarol or heparin even though it is not possible to determine whether the pain represents myocardial ischemia with necrosis alone, as in Case 2, or the premonitory phase of coronary occlusion, as in Case 1

Case 1 demonstrates how the electrocardiogram in coronary occlusion with infarction differs from that seen in infarction without occlusion and emphasizes the value of retaining the term coronary occlusion. Since the symptoms in both conditions may be similar, some writers 14 have advocated discarding the term coronary occlusion.

However, the two conditions are different pathologically and can be distinguished electrocardiographically in the vast majority of cases, and it would appear desirable, for the sake of clarity, to consider them as entities. Furthermore, we have shown that it may be of importance therapeutically to do so

Summary

Anginal pain is the result of acute coronary insufficiency which may be divided into three types (1) transitory myocardial ischemia, a physiologic disturbance, (2) protracted myocardial ischemia, frequently with infarction but without acute coronary occlusion, (3) complete myocardial ischemia with acute occlusion and infarction

These three types can be differentiated electrocardiographically in the vast majority of cases. This diagnostic procedure is essential when the clinical picture is not characteristic.

A persistent anginal syndrome, beginning abruptly or showing sudden acceleration, may signify infarction without occlusion or the premonitory phase of occlusion. During this phase the electrocardiogram may present the changes of infarction without occlusion. When the occlusion becomes complete, the electrocardiogram assumes a typical pattern.

It is suggested that anticoagulant therapy in the stage of impending occlusion may prevent the latter

THE SWEETEST LIVES

The sweetest lives are those to duty wed,
Whose deeds both great and small,
Are close-knit strands of an unbroken thread
Where love ennobles all
The World may sound no trumpets, ring no bells,
Thy love shall chant its own beatitudes
After its own life-working A child's kiss
Set on thy sighing lips shall make thee glad,
A poor man served by thee shall make thee rich,
A sick man helped by thee shall make thee strong,
Thou shalt be served thy self by every sense
Of service which thou renderest
ELIZABETH BARRETT BROWNING

PRIMARY STREPTOCOCCUS VIRIDANS MENINGITIS

Report of a Case with Necropsy Findings

STANLEY A KORNBLUM M.D., CHARLES ZALE M.D. and IRVING W. ROBINSON, M.D. Bronx, New York

(From the Departments of Pathology and Pediatrics Morrisania City Hospital)

TT IS known that streptococcus viridans has a low pathogenicity for man' but it can and does cause disease leading to death. Neal (1924) 1 in a review of meningitis and its distribution according to ctiology and age states that "streptococcus viridans vers rarely causes meningitie ' A review of the literature since has revealed only one case report of primary streptococcus viridans meningitis.* There have been many reports of streptococcus viridans meningitis but they have all been secondary to some focus of infection 4-4 We wish to present the clinical course and necropey findings in a case of primary streptococcus viridans meninzitis.

The patient was a 16-month-old white boy ad mitted to the pediatric service of Morrisania City Hospital on February 28 1946 and died April 6, 1946. Fourteen days before admission the patient developed a running nose which cleared up spon-taneously Three days before admission be became taneously Three days before admission be became febrile, lethargic irritable and vomited several times.

On admission the temperature was 104 F (rectally) and the child presented the following positive physical findings The patient was drowsy and neurologically presented the following signs of meningitis marked Kernig and Brudzinski, distinct nuchal rigidity with head rotated to the right The deep tendon reflexes were hyperactive and the child was irritable to any passive movements Funduscopic examination showed no papilledema or venous distension

Past history and development history were non-contributory Under the family history it was noted that the patient a father was rejected for duty by the army because of inactive pulmonary tubercu losia

Hospital Course.-The child presented a septic Isbrile course during his hospital stay despite chemotherapy. The Mantoux test in a dilution of 1-100 was negative. Repeated spinal fluid examinations (Table 1) failed to reveal tubercle bacilli torula or other organisms. On the twenty ninth hospital day the patient had a convulsive episode On the thirty fourth hospital day the temperature

rose to 105 F and there were physical findings of bronchopneumonia. The patient expired on the thirty-sixth hospital day Repeated blood, urine, stool and throat cultures were all negative. Blood chemistry studies were all normal.

Necropsy findings revealed that the body was that of a well-developed, well-nourished white boy infant Only 25 cc. of slightly cloudy fluid could be obtained on lumbar puncture. The cisterna was then tapped and gave a further 15 cc of similar fluid.

The dura appeared thick, injected, and dull. It was under great tension and when cut the brain substance bulged around the edges The gyrı were generally flattened. There was a dense, greenish, firm exudate covering the base of the brain. It extended from the optic chiasma to the medulia and had grown over the roof of the fourth ventricle and the inferior surface of the cerebellar lobes. The exudate was so dense that none of the cranial nerve origins or arteries could be seen without dissection. A marked internal hydrocephalus was present,

The petrous portion of both temporal bones were opened but revealed no gross evidence of infection The other annuece also showed no evidence of infection

Both lungs on section showed a terminal broncho-oneumonia. The other organs were grossly normal. No focus of infection could be found.

Bacterology —All specimens obtained at necropsy for cultures were inoculated into dextrose broth media, petragnani media, and chocolate agar slants which were incubated under CO, tension The cultures and smears from the spinal fluid were negative Smears and cultures from the petrous portions of both temporal bones were also negative Smears from the exudate over the brain revealed gram-positive cocoi in short chains. Cultures showed a good growth in dextress broth media after twenty four hours and smears again showed gram-positive cocci in short chains Subculture on blood agar yielded minute colonies with alpha hemolysis " These colonies were not bile soluble Smear from these colonies showed a gram-positive cocci in short chains.

TABLE 1 —SPINAL FLUID FINDINGS				
Spinal Fluid Pressure	Admission	Eighth	Hospital Days	Thirty-flith 260 mm of water
Turbidity Cell count	Clear 40 lymphs per ec	40 lymphs per co	50-100 lymphs	Many polys.
Total protein Chlorides	67 mg per cept 591 mg per cept	46 mg per cent 685 mg. per cent	66 mg per cent	132 mg per cent
Sugar S multaneous blood sugar	14 mg per cent	32 mg per cent 105 mg, per cent	38 mg, per cent 105 mg, per cent	0 mg, per cent
Culture Smear Colloidal gold	No growth Negative	No growth legative	No growth Negative 0-0-0-0-0-0	Negative
Wassermann Levinson test Tryptophane test	Negative	Positive Negative	Vegative	

Summary

This is a case of primary streptococcus viridans meningitis in a 16-month-old child. It followed an upper respiratory tract infection. Clinically it resembled tuberculous meningitis because of its chronicity, failure to isolate any organism, equivocal spinal fluid findings, and lack of response to chemotherapy. Moreover, findings and bacteriologic study at autopsy revealed this to be a case of streptococcus viridans meningitis for which no focus could be found.

THE PRICE TAG ON AN M D

If harsh words are occasionally heard when a layman scans his doctor's bill, you can't always blame him He probably has only a vague notion of what it costs to become an M D and to make a start in the medical profession. Yet the plain fact is this A price tag of at least \$32,000 can be pinned on today's new comer to general practice.

THE NEW G P S INVESTMENT IN HIM	SELF
His premedical education meant an outlay of During his medical schooling he spent His six-year earning loss while training was Entering practice he invested in equipment	\$ 7,000 7 000 15 000 3 000
Total cost	\$32 000

Making such facts known to the public is obviously a job for the medical societies, and a vital one

Medical Economics has just completed a survey of fifty-two approved medical schools to determine current costs of undergraduate medical education Deans of these schools supplied their best available figures on what the average student spends for tuition, room, board, books, and instruments. The sampling was checked regionally, by size and type of school. It was found to give a true cross section of the sixty-nine approved medical schools in the U.S.

The result? A sum total of \$7,016 as the average amount the doctor-to-be lays out during his four

years of medical schooling

A number of deans commented that their own figures were probably low in relation to the national average. They do, indeed, afford a marked contrast to the costs reported by several institutions in the New England and Middle Atlantic states. At one of these schools the four-year cost to the student currently stands at \$9,640

Tabulated in the adjoining table are comparisons of Medical Economics' 1947 study with surveys conducted in 1931 and 1920. They show clearly that tution costs, though not so inflated as living expenses, are keeping step with the upward trend Medical educators predict that the tuition curve will continue to rise unless checked by subsidies or special taxes. Many point out that present income from students pays less than half the dollars-and-cents.

cost of the training given

Not all medical students, of course, have had to
get educational funds from their families During
the war the schooling of close to 80 per cent of all

WHAT THE AVERAGE STUDENT PAYS OUT DURING HIS MEDICAL SCHOOLING 1920 1931 1947 \$299 Tuition \$187 \$463 Room and board 370 Books and instruments 106 138 Clothing, entertainment, laundry and other per sonal items 265 369 528 Total for one academic year Total for four academic \$ 800 \$1 163 \$1,754 83 560 \$4,652 \$7,016 3 cars

budding M D's was paid for under Army or Navitraining programs. Currently, many veterans are using the G I Bill of Rights to finance their medical training. Sixty per cent of those entering medical school last year were veterans eligible for this subsidy.

Though an important fraction of the M D 's price tag, the sum spent during medical school is far from being the whole amount. Premedical education must be counted in, too. A number of educators to-day price college and preparatory training at \$7,000 and call it a conservative average.

and call it a conservative average

Then there is another item While the physician of the future is applying himself to medical text-books and, as an intern, to case histories and clinics, his college classmates are gainfully employed The intern may clear his living costs, but, more often than not, six years pass while young doctors learn and their lay contemporaries' earn

Studies in certain castern universities show that the average college graduate who goes directly to work today will earn about \$15,000 during that six-year period So add to an M D's price tag the \$15,000 he didn't make

Even when he has completed his basic training, the young M D isn't ready to start recouping his investment. That takes professional equipment. A survey, for 1943, showed that the average physician in practice one or two years owned \$3,275 worth of office and medical equipment. That sum has to be counted.

Thus, the overall estimate of \$32,000 may be looked upon as a fair price tag for today's privately educated young doctor. If more of your patients knew that, it's likely that they would scan your bills with greater understanding—Medical Economics, May, 1947

MASSIVE GASTROINTESTINAL HEMORRHAGE IN FULMINATING MENINGO COCCUS MENINGITIS (WATERHOUSE FRIDERICHSEN SYNDROME) WITH RECOVERY

INVING GRAY, MD, FACP, Brooklyn New York, and M ROBERT TALISMAN, MD, Woodmere New York

(From the St Joseph & Hospital Far Rockaway)

THE symptoms caused by meningococcus infec tion are primarily those of acute cerebrospunal Whenever sudden collapse with pur pura occurs in meningitis or following a sore throat the diagnosis of infection by A cuseria intracellularis meningococcus should be suspected. Until 1940 ! fulminating meningococcemia or the Waterhouse-Friderichsen syndrome was described as uniformly fatal The authors call attention to the fact that in a group of 51 cases reported there had been only 7 recoveries. Four additional cases are noted, one of which survived Three of these cases were in adults. The presence of purpuric or petechial spots on the skin associated with massive hemorrhagic destruction of both adrenals, as evidenced by clinical and objective findings in the presence of a fulminating septicemia, is recognized as the Waterhouse-Fri derichsen syndrome. Hemorrhagic changes in the adrenals were recently reported in four patients who died and came to autopsy ! In 1 case, the adrenals were grossly normal but microscopically showed extensive edema and hemorrhage of the capsule. In the other 3 cases there was macroscopic evidence of hemorrhagic destruction of the adrenals. In the case reported by Kwedar, a housewife aged 58, died of this clinical syndrome (Waterhouse-Friderichsen) At autopsy, the right adrenal was firm and very dark red in color This discoloration involved both medulls and cortex The left adrenal was softened but the hemorrhagic discoloration was Microscopic examination of both adrenals showed extensive, massive hemorrhage with almost complete destruction of all of the tissue elements. Bacterial stain showed meningococci in the adrenals. Jacobi and Harris' collected 130 cases of this syndrome and added an additional case in which recovery occurred Recovery following treatment with penicillin has recently been doscribed by Hayes. In discussing the treatment, Bush and Baileys stress the excellent response to sulfonamide therapy Seventy-six cases recovered satisfactorily with this type of treatment. Recovery also occurred in 50 patients who had men ingococcus bacteremia. The authors stress the fact that the patients presented the characteristic clinical features of the Waterhouse-Friderichsen syndrome In 4 fatal cases of this group which came to autopsy 3 had bilateral and 1 unflateral advenal hemor rhage.

The following case is reported for reason of the fact that the clinical symptoms at the onset were somewhat bizarre and manifested by marrive gastrointestinal hemorrhage. The symptoms of bleeding into the gastrointestinal truct, as noted by the vomiting of blood and the tarry stools anto-

dated the appearance of the petechial and purpurier ash over the skin by several hours. The clinical symptoms were those usually described and characteristic of the Waterhouse-Friderichsen syndrome. Recovery followed the use of sulfonamide and penicillin therapy.

Case Reports

A man white adult, 30 years of age, in good gen eral physical condition and always well previously. returned from a trip West on February 20, 1945. He complained of general fatigue and feeling tired. The patient was seen at various intervals from February 1933, until the present date for mild general complaints. The blood pressure at all times was within normal limits. A unnalysis done in 1943 was normal. On the evening of February 20 there was a sudden onset of severe chill, headache and pain in the extremities. The physical exam: nation was essentially negative except for a mild red throat Temperature was 103 F by rectum There was no nuchal rigidity and no abnormal neurologic findings. The lungs were clear A diag nosis of acute upper respiratory infection was made on the basis of a mild red throat. Antipyretic therapy was instituted and at 3 00 P M. on the following day (February 21) the fever had completely subsided The patient had no complaints except for headache. There was no nucleal rigidity The skin was clear At 4 00 PM. on February 21 there was a sudden onset of vomiting of blood with the rectal elimination of tarry stools. About two hours after the onset of these symptons, the patient presented all the clinical symptoms of shock. The skin was cold pulse rapid and the blood pressure had dropped to 100/80 The patient was irrational and tossed about the bed. During the next two hours a petechial and purpure rash developed and con-tinued to spread in intensity The neurologic signs were changing rapidly. The deep reflexes were at Nuchal rigidity was present There was black vomitus about the bedelothes and all about the bed The patient was given 1/4 grain of morphine sulfate by hypodermic, and at 8 00 r.m. about four hours after the onset of the bloody vomiting and melena, was transferred to the St. Joseph s Hospital in Far Rockaway New York.

Hospital Course - February 21 1945. The pa

Hannial Course — February 21 1945. The pastent was violent and uncontrollable when stimulated A spinal tap was unsuccessful Ten thou sand units of penicillin were given perithecally and the intravenous drip of penicilin started. The patient received 90 000 units within the next few hours and another 100 000 units within the first eight hours after hospital admission. The clinical picture was that of fullminating meningococcus infection (Waterhouse-Friderichem syndrome) although the organism had not as yet been isolated. A Levine tubo was inserted into the stomach and 5 Gm of sodium sulfadiazine given in solution

p 1

through the tube on February 22, 1945, morphine was continued since admission because the patient was violent and uncontrollable He could not be aroused and responded only to very painful stimuli with motor activity of an uncontrollable type Sodium sulfadiazine was introduced into the stomach by a Levine tube, and some six hours later this procedure was repeated Sodium bicarbonate in solution was administered following each installation of the sulfadiazine Spinal tap was successful and cloudy fluid obtained Twenty thousand units of penicillin were introduced perithecally patient received another 90,000 units of penicillin during the day and evening. On occasions, he would vomit large quantities of blood There was rectal incontinence with the passage of large, tarry The purpuric spots noted the day previously increased in amount and size and there was coalescence of these areas especially in both upper extremities, most prominent over the elbows

Laboratory Data—Blood hemoglobin was 100 per cent, red blood count was 424 M, white blood count was 24,900 with 81 per cent polymorphonuclears, 17 per cent lymphocytes, 2 per cent monocytes Bleeding time was fifty seconds Coagulation time was four and one-half minutes. Urine was amber, acid, and the specific gravity was 1025, 1 plus albumin, 2 plus sugar (infusion sugar), negative acetone. Microscopic examination. hyaline and coarsely granular casts in moderate numbers, 3 to 5 white blood cells per high power field.

Spinal fluid Cell count was 8,860 polymorphonuclears per cm, 300 red blood cells per cm Albumin 2 plus, globulin 2 plus, sugar 30 mg per cent, chlorides 720 mg per cent, smear, no organism seen

Feb 23, 1945 The patient continued in a coma all day The temperature ranged between 102 and 103 F. Vomiting had ceased There was still rectal incontinence with passage of large, black stools. Penicilin was continued throughout the day, 50,000 units in Ringer's solution intravenously and then 20,000 units every three hours intramuscularly. Five doses of sulfadiazine (1½ Gm) and sodium bicarbonate solution were given by Levine tube throughout the day. The patient's clinical condition remained critical throughout this entire twenty-four hour period (forty-eight hours after the onset of his illness and admission to the hospital)

Blood sulfadiazine level in the morning was 12 0 mg per cent, white blood count was 21,400 with 85 per cent polymorphonuclears, 7 per cent lymphocytes, 4 per cent monocytes, and 4 per cent juvenile forms Cultured spinal fluid Neisseria intracellularis meningococcus Urine (A.M.) 10 to 12 red blood cells per high power field, occasional white blood corpuscles, rare coarsely granular casts. Urine (P.M.) 18 to 20 red blood cells per high power field, few white blood corpuscles, few pus clumps, few pus casts

Feb 24, 1945 Sulfadiazine therapy was discontinued because of the high concentration in the blood and more especially because of the findings after examination of the last specimen of urine. Twenty thousand units of penicillin were given intramuscularly for 4 doses. About 9 00 a M, some sixty hours after the onset of his acute illness, the patient spoke his first rational words. His speech was thickened and his mind wandered but some of the sentences were recognizable. The temperature still remained elevated to about 101 F. Nuchal rigidity was marked and the absence of reflexes persisted

The patient continued to complain of severe and constant headache. There was no vomiting during this day and none during the rest of the hospital stay. He had two large and black stools this day. The blood sulfadiazine level dropped to 6 mg per cent Examination of the urine showed a few white blood corpuscles, and a rare pus cast, and there were 3 to 4 red blood corpuscles, per high power field. Sulfadiazine therapy in 1-Gm doses with adequate amounts of sodium bicarbonate was again introduced. During the following forty-eight hours, a total of 6 Gm of sulfadiazine was administered.

Subsequent Course -20,000 units of penicillin were given to the patient on February 25, 1945 (four days after admission), and then entirely discon-Tarry stools continued until February 28, The headache was rather severe for the first two weeks and then gradually tapered off rigidity remained for a tike period of time. Abdominal redexes returned the first day after admission to The deep tendon reflexes were evithe hospital denced within one week after the patient's illness The temperature persisted over 100 F until March 11, 1945 (nineteen days after admission to the hospital), although a renewed course of sulfadiazine was started on March 5 for a seventy-two hour period A total of 81/2 Gm was given by mouth during this time. After the third or fourth hospital day, the petechial rash gradually wanted and disappeared by the end of the week However, the purpure spots over both elbow regions which had become confluent, showed evidence of a deep, dry gangrene The surrounding tissue and periarthritic tissues of both elbows were red, swollen, and hot Response to continuous wet soaks and local therapy was slow The patient was discharged from the hospital on March 13, 1945, after twenty-one days of hospitalization. There was occasional headache but no nuchal rigidity was present and the temperature The gangrenous had been flat for about one week area in the region of the left elbow healed within several weeks after discharge from the hospital The sloughing and gaugrenous area in the right elbow region was much slower in healing deep, irregular ulcer over the posterior surface of the right elbow region which did not heal for about four to six weeks after discharge from the hospital Several smaller purpuric areas of the right metacarpophalangeal joints produced a gradual separation and sloughing of these local tissues, but these healed rather rapidly

On February 26 the blood contained a sulfadiazine level of 75 mg per cent, hemoglobin was 722 per cent, red blood count was 37 M, white blood count was 17,600 with 71 per cent polymorphonuclears, 15 per cent lymphocytes, 10 per cent monocytes, 2 per cent juveniles, 1 per cent eosinophils, 1 per cent Turk cells Urine was amber, alkaline, with a specific gravity of 1 019, a trace of albumin, sugar and acetone negative, 3 to 5 red blood cells per high power field, few white blood corpuscles, rare coarsely granular casts On March 2 the urine was amber, acid, with a specific gravity of 1 025, albumin and sugar negative, and there were one to 2 red blood cells per high power field, few white blood corpuscles On March 5 the hemoglobin was 702 per cent, red blood count 369 M, white blood count 20,100 with 65 per cent polymorphonuclears, 16 per cent lymphocytes, 13 monocytes, 3 eosinophils and 3 juveniles On March 6 the urine was light amber, acid, specific gravity was 1 016 with a faint trace of albumin, 1 to 2 red blood cells per high power field, 4 to 6 white blood

corpuscles. On March 9 the hemoglobin was 70 6 per cent red blood count 375 M white blood corpuscles 12 100 with 56 per cent polymorphonuclears 31 per cent lymphocytes 11 per cent monocytes, and 2 per cent cosinophils. The urine was straw-colored, acid with a specific gravity of 1 020 and a trace of albumin 2 to 3 red blood cells per

high power field occasional white blood corpuscles In the latter days of the hospital stay, the pa-tient presented a picture of peripheral median nerve paralysis of the right hand. There was loss of sensation in the thumb and the second and third fingers, and an mability to use these fingers. This neuritis was not progressive and when last examined, one year after the initial illness there still remained some decrease in sensation of the right thumb and index finger but the muscle power of the hand was good The anemia as a result of the massive gastrointestmal bleeding was resistant to therapy at first but there was gradual improvement of the blood picture toward normal

Summary

A man, white adult, 39 years of age had a sudden onset of chill headaches, pains in the extremities, and fever There was favorable response to antipyretics. Twenty four hours later, there were signs and symptoms of a severe blood stream infection with pronounced vomiting of blood and the passage of tarry stools. The signs of shock and the general clinical picture was that usually described

as the Waterhouse-Friderichsen syndrome. The overwhelming infection produced hypotension tachycardia, the presence of nuchal rigidity, and the diffuse netechial rash These findings warranted the assumption that the patient had a bacteromia with involvement of the meninges Neisserm intra cellularis meningococcus was cultured from the spinal fluid The patient received 540 000 units of penicillin and 15 Gm. of sulfadiasine during the period of his acute illness. The patient was comatose for about sixty hours The vomiting of blood oc curred at intervals during the first thirty-six bours. Evidence of ulceration of the gastrointestinal tract, as indicated by the presence of tarry stools, continued until February 28 1945, one week after ad mission to the hospital Evidence of involvement of the peripheral median nerve of the right hand persisted and, at the end of one year the patient still had some decrease in sensation of the thumb index and to a lesser extent, of the middle finger

AMERICANS WORRY TOO MUCH ABOUT MENTAL DISEASES

If you have ever thought Am I going crazy?

here is reassurance

Americans worry too much about mental disease. Dr C Charles Burlingame, president of the Institute of Living, formerly known as the Hartford Retreat warned recently And we may be developing a "national schisophrenic personality

People are bewitched by psychiatric jargon and see mental disease in perfectly normal emotional swings. Unless this dangerous preoccupation is stopped, thousands of America ing for help from mental specialists. thousands of Americans will be look

The vast majority will never have the opportunity to get within speaking distance of a psychiatrist, even to be reassured that they have no budding serious mental disease There are only 4 000 psy chiatrists to take care of advising all the worried people in the country and only 2,500 of these are certified by the American Board of Psychiatry and Neurology

We have been talking a good deal about taking a leaf from the book of the tuberculoris and cancer movements, said Dr Burlingame, preaching that

mental illness must be attacked. like tuberculous and cancer through a national alertness to carly psychiatric disorders

But the man who thinks he may have signs of tuberculosis or cancer can get a physical checkup promptly The person who fears he has mental symptoms is not going to be so lucky

Explaining the developing of a possible 'national schizophrenic personality Dr Burlingame observed that 'schizophrenic means "a splitting of the per sonality and Americans are split between group generosity and individual selfishness.

On one aide we as a nation, are extolling the need for love and light and philanthropic kindliness around the world, while on the other side we as individuals, are basing our entire existence on the precept of 'What do I get out of it?'

He urges a new appreciation of spiritual values and teaching children social responsibility through the establishment of 'parentoriums. These would be parent guidance centers, not necessarily related to suckness of any kind.—Science News Letter May 3 1947

BENADRYL TREATMENT OF ANGIONEUROTIC EDEMA

MARDOQUEO I SALOMON, MD, ScD, Bronx, New York

ALTHOUGH the exact pharmacologic action of beta-dimethylaminoethyl benzhydryl ether hydrochloride (commonly known as benadryl) is still imperfectly understood.2 there can be no doubt about its usefulness in a large gamut of allergic disorders of the skin! and nasal mucosa. The reports on its effectiveness in asthmatic conditions are definitely much less encouraging On the other hand, the widespread use of antibiotics, especially penicillin, has certainly contributed to enhance the frequency of angioneurotic edema and urticaria in clinical practice, hence, the augmented frequency of indications for use of benadryl The following is a brief account of 3 cases in which I had the opportunity of using this drug

Case 1 —A 28-year-old white Central American woman, without any history of allergic manifestation and usually in good health, developed a rather mild fever (101 5 F), accompanied by lower abdominal pains and cough. The physical examination revealed diffuse bronchial rales in both lung fields and a tender, fairly hard tumefaction in the region of the right adnexa. The diagnosis of acute bronchitis was established As for the adnexa, in view of the history of an old (seven years' duration) chronic, probably gonoccic anexitis, I believed it to be an acute "poussee" of her chronic pelvic infection, apparently reactivated by her acute bronchitis There was no sputum, nor was there any significant vaginal discharge, the bacteriologic examination of the latter disclosed the presence of a banal mixed flora Otherwise, the physical and routine laboratory examination of the patient was negative, except for a moderate leukocytosis

I decided to treat the patient with penicillin, 300,000 units in wax was administered intramuscularly once daily The result was dramatic fever, cough, rales, and tenderness in the pelvic region melted away After five days of treatment, abnormal findings disappeared entirely except for a residual tumefaction in her right adnexa, surely due to the fibrotic organization of her chronic pelvic infection However, while still under treatment, about thirty-six hours after the first injection of penicillin, the patient complained of pruritus in her perincal region, slightly aggravated by the further administration of the antibiotic (Absolutely no other therapeutic agent had been given the patient,

except rest, of course)

Shortly after the fifth and last injection, the patient developed an extremely marked angioneurotic edema involving the face, especially the eyelids, and a diffuse urticaria, mainly on the extremi-The usual antipruriginous lotions, hypodermic administration of epinephrine, intravenous administration of calcium thiosulfate, and oral administration of bellergal, and mild sedatives were entirely without effect. As a matter of fact, and in spite of the elimination of further penicillin therapy, the patient's condition became intolerable during the first two days following the last injection of penicillin. At that time, I decided to give her benadryl, 50 mg three times a day. About one hour after the first capsule, the marked edema of

the face started to diminish On the next day, after the fourth or fifth capsule, her skin condition faded She did not need more than six away entirely capsules altogether No side-effects were noted

Case 2 -A 22-year-old white married American noman, usually in excellent health, consulted me on account of a marked angioneurotic of the uvula, so marked, indeed, that she had been unable to eat or drink since the sudden onset of the disorder cause of the angioneurotic edema could be disclosed, the search for the offending agent (almentary, inhalational, toxic, etc.) was entirely fruitless. The only interesting point in her family history was the fact that her mother is a slightly "neurotic" woman whom I had treated several times for hysteric "globus" in the throat

I also administered benadry 1 in doses of 50 mg three times a day to this patient. The result, how-ever, was nil. In the meantime, the patient's condition became much worse, and in the late evening, about twelve hours after the onset of the disorder, the patient became afraid of suffocation, although she is usually a nonapprehensive woman intravenous injection of calcium thiosulfate (5 cc of a 10 per cent solution) gave her immediate relief The second injection, administered the next morning, cured her completely

Two points should be noted in connection with this patient first, that her disorder was strictly limited to the uvula, her general physical examina-tion remaining negative, second, that the first dose of benadryl caused nausea, while the second made her vomit and she did not take more than two capsules altogether

Case 3 -Although this case does not concern angioneurotic edema, I believe it worth mentioning for reasons that will appear obvious later patient, a 19-year-old white girl, without a history of any kind of hypersensitiveness, consulted me because of a typical dermatitis venenata Due to the special circumstances of the case (the patient lived on a farm some distance away) I could not ascertain the exact cause of her condition. In view of the severe pruritus on her arms and forearms, I prescribed an antipruriginous (calamine) lotion and benadryl capsules in the same dose as above fortunately, I did not see the patient again until about three weeks later, then I learned that a few hours after the ingestion of the first capsule she had become deeply cyanotic and felt oppressed for about ten hours She attributed the "trouble" to the drug and did not take it the next day

However, on the third day, because of the persistence of the dermatitis, she took another capsule of benadryl Again, her deep, generalized cyanosis and the distress reappeared for the rest of the day Incidentally, the dermatitis did not improve under the influence of benadryl, but it disappeared spontaneously ten days later. The physical examination of this patient revealed nothing abnormal except a moderate atrophy of the tibialis anterior, peroner, and gastrocnemius on the right leg, sequelae of an episode of poliomyelitis suffered as a child . In particular, the examination of her cardiovascular, respiratory, and hematologic condition was entirely negative

Comment

Case 1 needs little elaboration—the causal relationship between the administration of penicillin and the appearance of the dermatosis seems to be obvious. Incidentally an analogous case has recently been published *confirming again the useful ness of benadryl in this kind of disorder

Case 2 is an example of the failure of the drug in a certain percentage of cases although it clearly showed the effectiveness of calcium thiosulfate

The last of our series of cases deals with an allied, yet different, condition. Nevertheless, it seems to suggest a possible side-effect of benadryl that has

not been described thus far I fully realise the deficient description of the cyanosis, having relied solely on the patient and har mother for it, but not-withstanding this deficiency I feel that the case should be reported because benadryl is still a new and not too-well clinically experimented drug.

MARKED DECLINE IN MORTALITY AMONG OLDER PEOPLE

The remarkable success achieved in reducing the death rate in infancy and childhood has tended to distract attention from the large declines in mortality recorded at the older ages. A good picture of the trend of the death rate at ages 45 to 74 over the past thirty five years is available from the experience among the Industrial policyholders of the Metropolitan Life Insurance Company

As a matter of fact, in this insurance experience, the ago-adjusted death rate at 45 to 74 years decilined 37 1 per cent among white men and 43 9 per cent among white women between 1011 to 1915 and 1942 to 1946 Each of the individual ago groups within this range showed a very material reduction in mor tahty although the relative declines decreased with each advance in age. Fven at 65 to 74 years the re-

duction in mortality during the interval was as much as 31 0 per cent among white men and 38.6 per cent

among white women.

Corresponding to these decreases in mortality were notable increases in the expectation of life. At age 45 the expectation of life increased by 50 years among white men and 57 years among white women between 1911 to 1912 and 1945 the earliest and the latest year respectively, for which such data are available even at age 65 the corresponding gains were 2.2 years and 29 years. This is an increase of about one quarter in the thirty five year period Under present conditions white men who reach the normal retirement age of 65 may expect to live about 12 years.—Statistical Bulletin, April, 1937

THE AMERICAN CONGRESS OF PHYSICAL MEDICINE

The American Congress of Physical Medicine will hold its twenty fifth annual scientific and clinical session September 2, 3 4, 5 and 6, inclusive at the Hotel Radisson, Minneapolis. Scientific and clinical sessions will be given the days of September 3, 4, 5, and 6. All sessions will be open to members of the medical profession in good standing with the American Medical Association. In addition to the

scientific sessions the annual instruction courses will be held September 2, 3 4 and 5. These courses will be open to physicians and the therapitis registered with the American Registry of Physical Therapy Technicians. For information concerning the convention and the instruction course address the American Congress of Physical Medicine 30 North Michigan Avenue Chicago 2 Illinois.

PERFORATION OF THE GALLBLADDER

I L CANTOR, M D, Riverhead, New York

(From the Eastern Long Island Hospital, Greenport)

PERFORATION of the gallbladder usually occurs in patients who have had a long-standing history of chronic calculous cholecystitis, a small portion of the acutely inflamed gallbladder becomes gangrenous and internal pressure causes a stone to break through the weak wall evacuating bile into the peritoneal cavity Eliason and McLaughlin state that early operation is urged in all cases of acute cholecystitis which do not promptly subside under adequate With the modern use of sulpalliative treatment fonamides and penicillin, plus the liberal use of blood plasma and transfusions, the mortality rate in this disease has been lowered considerably of cholecystostomy and cholecystectomy for this entity are both correct in their respective choice of operative procedures provided the patient survives

Case Report

J G, a white man, aged 42, was first seen at home on May 3, 1946, complaining of severe pain in the epigastrium of three days' duration. At the onset of his illness, he was under the care of another physician, who had given him repeated injections of 1/4 to 1/2 a grain of morphine to relieve his pain There was no vomiting, and bowels moved daily, the patient The only drank liquids sparingly during this time positive history elicited was one of chronic indiges-Gallbladder 1-rays with no demonstrable pathology had been taken two years before Physical examination revealed a very sick man with peritonitis facies, shock, a temperature of 97 F and a pulse of 140 The abdomen was very rigid throughout, with maximum tenderness over the epigastrium A tentative diagnosis of empyema of the gallbladder or perforated peptic ulcer was made, and the patient was rushed to the Eastern Long Island Hospital The trip, 22 miles, in an ambu-lance was endured with difficulty, as his pain was At the Hospital, the white blood count was 23,250 with 90 per cent polymorphonuclears The urinalysis was negative, and a flat plate of the abdomen was negative for obstruction and perfora-Gallbladder calculi were not seen

Immediate laparotomy under ether anesthesia was performed Five hundred cc of blood plasma was

An upper right rectus instarted intravenously cision was made, and the peritoneum was opened with release of 200 cc of bile. The stomach, The stomach, omentum, and intestines were all markedly bile-A perforation the size of a B B shot was seen in the fundus of a gangrenous gallbladder, which was tightly packed with stones. The gallbladder was packed off with warm saline packs and opened widely, all stones were removed by digitally milking them out and with the scoop. The gallbladder was removed by clamping across the upper two-thirds with Kocher clamps, and evening this portion, the cystic artery and duct were then identified easily, doubly ligated with chromic 0 catgut, and the remainder of the gallbladder re-moved Ten grams of sulfanilamide powder was placed in the gallbladder bed, a Penrose drain was placed in the foramen of Winslow and brought out through a stab wound in the right flank Closure was made routinely, a subcutaneous gutta-percha drain used An additional 500 cc of blood plasma were given intravenously one hour postoperatively, 2,000 cc of a saline solution were administered subcutaneously, 30,000 units of penicilin were given every third hour, and coramine, 1 ampule every fourth hour for nine doses. The postoperative course was entirely uneventful, temperature and pulse were normal by the fourth day, the wound drained for eight days, penicillin was discontinued on the eighth day, and the patient was discharged on the thirteenth day as cured

This was a neglected case of acute perforation of the gallbladder, gangrenous and packed tight with stones, in which a cholecystectomy was performed as the method of operative choice, with cure

BOND-A-MONTH PLAN FOR THE DOCTOR

The US Treasury Department, in cooperation with the Nation's banks, is offering to physicians a systematic savings program starting June first and continuing through July Under the Plan, a onetime order blank is signed at the bond buyer's bank and the bank then delivers to the doctor a bond of the

denomination designated each month, debiting his checking account for the purchase price

This constitutes a simple method for providing for future security and deserves the attention of Further details are available at the profession local banks

CHARCOT'S JOINT IN DIABETES MELLITUS

MILTON H MORRIS, M D, Far Rockaway, New York

THE modern conception of diabetes is that it is a widespread disease involving many tissues and organs remote from the pancreas. It is the alterations in these structures which determine the confort and longevity of the diabetic

The diagnostic triad of diabetes, vix polyuria, polyphagia, and polydipsia as early symptoms of diabetes must be replaced by remote changes in volving nerve tissue even before the actual diabetic

state

Woltman and Wilder' describe pathologic changes in the spinal cord and peripheral nerves. Root and Rogers' describe diabetes neurits with paralysis Gill' refers to the diabetic cord bladder Pryces' reviews 3 cases of diabetic pseudotabes. Jordan's reviews the effects of diabetes on the nervous system and states that pain and parethesia are just as frequent as frequency hunger, and thirst.

These changes in nerve tissue appear early and may antedate the onset of hyperglycemia which may be revealed at this time only by carefully con-

ducted augar tolerance tests.

Under this same classification of diabetic neuropathy is the so-called neuropathic or Charcot s joint. Whereas changes in nerve structures are common, the so-called Charcot s joint is rare. This is demonstrated by the few cases reported in the literature the only large group being the report of the 14 cases from the New England Deaconess Hospital by Bailey and Root 4

The pathology consists of separation and frag mentation of the tarsal and metatarsal bonom There is absorption of bone in which the periosteum attempts to lay down new bone. A loss of delineation between the tarsal bones and the proximal

head of the metatarsal bones is seen (Fig. 1)

The cause is unknown Arteriosclerous is a possible factor but many cases show no arternal involvement Laboratory studies and clinical observation have not revealed the presence of syphilis syringomyelia, or leprosy

The clinical course is that of a painless, noninflammatory swelling of the nudloot with a characteristic appearance. A limp will develop which is associated with the alteration of the mechanics of the foot and its relationship to weight-bearing. The subsequent history is that of a slow progressive lesion unaffected by the proper control of the diabetic state.

The rare occurrence of Charcots joint in diabetes mellitus and the possibility of confusing it with similar lesions has prompted me to report the following case

Case Report

W M a woman aged 53 years, was admitted to St Joseph & Hospital complaining of a limp on walking and swelling of the left foot. There was no history of diabetes or other motabolic desorders in the family. About three weeks before hospital

Fig 1

admittance, the patient noticed a swelling of the left foot

The general physical examination was negative except the findings herein described limited to the lower extremities. There was some evidence of trophic or nutritional changes on the anterior aspects of both legs consisting of dryness and surface desquamation. There was an absence of pulsations in the anterior and posterior thial vessels of both feet. At the foot levels oscillometric readings recorded zero. There was a marked diminution of the ankle and knee jerks. Positional and vibrators sensation was lost.

The left foot showed a diffuse, irregular swelling limited to the middoot and extending forward and decreasing in size toward the proximal tarsal bones. There was no redness and no pain on pressure Grasping this area gave the impression of a bag of bones. The plantar surface of the foot showed a loss of the normal configuration of the longitudinal

Walking was accomplished and transverse arch with a pronounced limp

The following laboratory observations were made

on September 8, 1945

Blood Count—Hemoglobin—79 4 per cent, red

11-24 count—4.050,000, white blood count—

12-24 count—4.050,000 to the blood count— 8,200, polymorphonuclears—70 per cent, lympho-cytes—21 per cent, monocytes—6 per cent, eosmophils-2 per cent, and juveniles-1 per cent

Urine—Amber colored, acid reaction, the spe-ic gravity, 1017, negative albumin, trace of cific gravity, 1017, negative albumin, sugar, the microscopic examination revealed a few calcium oxalate crystals, 1/2 RBC/hpf

The blood sugar tests were as follows September 8, 242 2 mg, September 17, 150 mg, September 20, 130 6 mg On September 10, 14, and 20 the albumin and sugar were negative The Kline test

was negative, and the nonprotein nitrogen was 36 0 mg per 100 cc of blood

Clinical Course—The patient was given a diet of 150 Gm of carbohydrate, 80 Gm of protein, and 60 Gm. of fat The treatment consisted of fifteen units of protamine zinc insulin and five units of crystalline insulin in the morning at break-She also received 100 mg of thiamin chloride, Two cc of depropanex was parenterally, daily given intramuscularly every other day

The mild diabetic state was easily controlled by the above regimen The peripheral nerve and cord involvement showed some subjective improvement The alteration and disturbed sensory phenomena were still present. The local condition of the foot as described above remained the same on discharge, one month after the patient's hospital admittance,

Summary

A case of Charcot's in a diabetic has been pre-Its rare occurrence in diabetes and the possibility of confusion with similar conditions were The relatively benign state of such emphasized individuals is such that the condition may require clinical observation and sugar tolerance tests to prove its presence The condition is chronic and is little affected by treatment

VENOUS THROMBOSIS, CLOTTING OF BLOOD IN VEINS, INCREASING

Two Baltimore physicians point out that venous thrombosis, a condition in which the blood clots in the veins, is on the increase because more operations are performed today

Writing in the April 26 issue of the Journal of the American Medical Association, the physicians—Thomas B Aycock and James W Hendrick, from the Department of Surgery, University of Maryland School of Medicine and College of Physicians and Surgeons suggest treatment for the two types of venous thrombosis, phlebothrombosis, and thrombophlebitis

The blood clot in phlebothrombosis is the result of tissue injury and can become detached easily from the vein wall These patients, although apparently not ill, are potential fatalities because of the danger that the clot will become detached and be carried by the blood stream to the lungs where it may act as a plug and cause death Early detection of this condition is possible if the patient is examined for tenderness of the legs following any tissue damage such as an operation

Cutting of the affected vein, which runs under the skin in the thigh, above the thrombus will prevent this clot from reaching the heart, suggest the physi-

On the other hand, the blood clot in thrombophlebitis is the result of inflammatory changes and is firmly attached to the vein wall This condition

usually can be diagnosed easily from symptoms such as fever, pain, and swelling The patient's chances of recovery are good, but, if he does not receive effective treatment, complications such as swelling, pain, ulceration of the legs and infection may develop

Treatment of this condition, which the physicians say will effect a cure, consists of injecting a local anesthetic such as procume hydrochloride or Bromsalizol into the sympathetic ganglions, nerve centers which run alongside the spinal cord. In addition, the leg is elevated until the swelling disappears, which usually requires from three to 10 days

Drs Aycock and Hendrick point out some of the factors which contribute to the development of venous thrombosis Citing other investigators, the authors state that a greater incidence of the disease was found during the winter months, especially when grippal infections were most prevalent Also, more cases have been reported in Northern states than in Southern states, which may be attributed to the greater incidence of the infections of the upper part of the respiratory tract in the northern section of the country. In addition, venous thrombosis has been found to occur more often in the older age group of patients and in patients who have cancer, heart disease, and serious infections

ALLERGIC DEAFNESS

ABNER M FUCHS MD, and RALPH ALMOUR, MD New York City

IT HAS been estimated that 10 pxr cent of the population suffers from major allerge manifestations and at least an additional 50 per cent ovperience minor allergic reactions. We are familiar with brouchial asthma, hay fever vasomotor rhinits urticaria, angioneurotic odema, gastrointestinal allergy, and migraine but until recently little attention has been given to similar reactions which occur in the ear of hypersensitive individuals. They have been recognized in their several phases for these past years.

The literature¹⁻² records allergic conditions involving the auditory canal, such as dermatitis of the car canal, those affecting the middle car, an acute otitis media due to an edoma of the tympanic cavity, and in the inner car cases of periodic vertigo as an entity or when vertigo is found in conjunction with tinnius deafness and gastric upset—the Ménerd's syndrome. On occasions the following category of oftice allergy is encountered

_ '_'

Case Report

An adult man highly allergic suffering from symptoms of hay fever bronchial asthma migraine and occasional attacks of vertigo complained that ingestion of aspirin produced a violent attack of asthma On one occasion, following a self-administered pollen extract injection, he went into shock and was found unconscious two hours later. He had been deaf in his right ear following myringotomy per formed during childhood. Several years ago he suddenly lost his hearing in his left ear, but it returned to normal within a few hours. He had several such occurrences at frequent intervals. Recently the deafness in his left ear has increased in frequency first once a month and later about every four days.

He is able to forctell the onset of an attack. He experiences fullness in both ears, followed within twenty four hours by a diminution of hearing acuity in his left car This becomes progressively worse during the following three days. From then on for another period of three days, the hearing rapidly improves returning to what he considers normal

During the entire period of the attack he experiences itching inside the car Audiometric readings between attacks were within normal limits for the left car namely 7 per cent loss (Fig. 1). The conversational runge was normal. The right car showed no hearing perception. At the onset of the attack, the tmongs showed a decoded loss in hearing which reached its maximum on the fourth day with a 49 per cent loss in the left car (Fig. 2). On the fifth day the patient reported that his hearing was improving (Fig. 3). He said that he felt "a gush of lluid in the back of his throat that seemed to come from his ears.

Hearing tests during the next three days revealed a rapid return to the original audiometric findings (Fig. 4) The patient stated that he now heard perfectly Examination at the termination of his attack was identical with the one preceding it, namely a 7 per cent loss Two subsequent seisures were studied with almost identical

findings

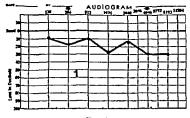

Otolaryngologio examination was otherwise essentially negative. There was no pathology found upon inspection of the ears, nose nasal accessory sinuses or the pharyngolarnygeal tract. The estanchian tubes were patent. The narophyaryngoscope aboved no abnormalities. The significant factor, however, was that the bone conduction for sound decreased during the attack and rapidly returned to normal after the episode was over. Blood pressure was 134/86. Blood count showed no abnormalities.

Sensitization tests with inhalant and food extracts gave marked reactions to grasses weeds, orris root, dust feathers, animal danders, such as rabbit and goat, and tobacco Marked reactions were also obtained on testing with wheat, oats, barley cod fish peanut, peach white potato cucumber and

tomato

By avoiding contact with the offending in halants such as feathers, orris root, animal danders, and tobacco and by eliminating the foods to which he was found to be sensitive both by testing and clinical trial, the patient s hearing improved. It was interesting to note that the ingestion of fish, tomato or ketchup which he ate to excess, produced a marked deafness which lasted about three days. The attacks were also precipitated by exposure to tobacco smoke and face powder. On three occasions when complete deafness occurred a sub-

Fra. 1

cutaneous injection of slow epinephrine such as 1/10 cc of a (1-500) gelatin epinephrine relieved the con-This was confirmed by dition within half an hour audiometric readings (Figs 5 and 6) An injection of sterile saline did not relieve the condition

Comment

Loss in Decibels

Wittmaack has shown experimentally that irritants in contact with the round window produced a marked increase in the fluid within the perily mphatic This in turn resulted in a compression of the endolymphatic spaces with pressure changes exerted on the end organs of the cochlear and vestibular Dependent upon the extent of these pressure changes, microscopic examination revealed various degrees of pathologic findings in the organ of Corti and in the canals Alterations varying from a mild edema to a complete degeneration from pressure necrosis were found

In the case presented here, it is felt that the allergic factors produce a repeated and successive hydrops of the perlymphatic space which temporarily exerted pressure upon Corta's organ through While this status exists, an imthe endolymph pairment of auditory function results and is evidenced clinically That no permanent damage has resulted until now is because the perilymphatic fluid pressure has not been of sufficient severity to produce lasting changes in the perceptive mechanism of the eighth nerve

Deafness due to the allergic states have been reported by Amberg and Hewitt, Mayo, Dean,7 and The recognition of this type of hearing loss depends upon the following factors

- A history and clinical proof of allergy
- 2 The absence of organic ear pathology
- The periodic occurrence of deafness of short duration with rapid return to normal

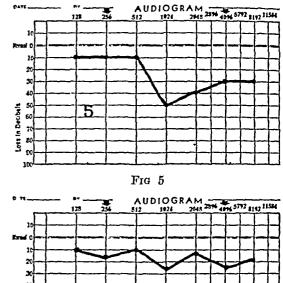

Fig 6

- The ability to produce an attack of deafness following exposure to offending allergens
- The immediate relief of hearing loss by injections of an epinephrine product

Conclusions

50 Loss in Decibels

Ø 70 80 6

Early recognition of the nature of this condition, especially in this patient, was of the utmost impor-He has complete nerve deafness in his right tance The edema in the internal left ear is as yet a reversible pathologic condition, that is, the condition may be relieved by avoidance of the offending substances or by the injection of epinephrine edema in the internal ear can be reproduced also by deliberate feeding of the known offending foods or by exposure to a large amount of the antigenic inhalants If the condition is not corrected, the frequent episodes of angioneurotic edema in the internal ear, by exerting pressure upon the organ of Corti, eventually will produce permanent lesions The condition then will become irreversible and improvement from allergic management will be of The patient is now avoiding the known offending foods and inhalants and also is receiving immunization treatment with dust and orris root extracts and the pollen extract of the grasses and weeds

Rheumatic Heart Disease to be Subject of Large-Scale Study

THE crippling effects of rheumatic fever and rheumatic heart disease among school children, 7,000 of whom are estimated to be infected in New York City, will be the subject of a forthcoming study in the Lower East Side District by the New York University, College of Medicine, in coopera-tion with the New York City Health Department,

ıt was announced ın Mav

In an address before the annual meeting of Irvington House, which cares for approximately one third of the City's rheumatic fever victims during the convalescent period, Dr Henry E Meleney, pro-fessor of preventive medicine of the New York University, College of Medicine, said the study will get under full swing in the fall. It is planned for a minimum period of three years, and will have the guidance of a Medical Advisory Committee from cooperating agencies

Dr Meleney said the study will be directed by Dr Elvira DeLice, of the Department of Preventive Medicine, New York University, College of Medicine, who, with Dr Charles A R Connor and Dr Mortimer W Weber, conducted a preliminary study in 1946 in the same district Eleven hundred and ninety eighth-grade children were examined at that time, and 39, or 33 per cent, were found to have existing or potential rheumatic heart disease Thirteen of the latter class were previously unknown to the School Health Service, Dr Meleney pointed

The project has the financial support of the New York Heart Association and the United States Public Health Service Other cooperating agencies

ınclude

Nen York City Department of Education, Rheumatic Fever Council of the American Heart Association, the US Children's Bureau, the New York School of Social Work, the Metropolitan Life Insurance Company, and other departments of the New York University, College of Medicine

Urological Association to Hold Annual Meeting

FROM June 30 to July 3, the American Urological Association will hold its 42nd annual meeting at the Hotel Statler, Buffalo, New York

foreign guests have been invited to deliver papers, and it is hoped that there will be an attendance of about 1,000

PERSONALITIES

Dr Walter W Palmer, professor of medicine at Columbia University, New York, has been chosen president-elect of the American College of Physi-He will take office next May 1 Dr Reginald Fitz, of Boston, was named first vice-president, Dr Francis G Blake, of New Haven, Connecticut, second vice-president, and Dr Charles T Stone, of Galveston, Texas, third vice-president *

Dr John M Loré, a fellow of the American College of Surgeons and of the New York Academy of Medicine, has been chosen president of the Alumni Association of the New York University, College of Medicine Dr Royal A Schaaf, also a fellow of the College of Surgeons, is vice-president Other officers include Dr Barbara Ann Parker, other others include Dr Barbara Alm Parker, secretary, Dr Richard M Hyman, treasurer, Dr Henry H Ritter, Dr John Munn Hanford, and Dr H M Wertheim, alumni federation directors, and Dr Sydney D Weston, Dr Walter Levy, and Dr S Aubrey Gittens, executive committee members at large *

Dr John W Ferree, former director of the division of educational services of the American Social Hygiene Association, has been appointed associate executive director of the National Health Council, New York City

* Asterisk indicates that item is from a local newspaper

This instruction was provided by the Medical Society of the State of New York with the cooperation of the New York State Department of Health *

Monroe County

Rochester Regional Diabetes Association has been organized by a group of Rochester physicians to carry on a diabetes educational program

carry on a diabetes educational program

Dr Charles B F Gibbs, Rochester specialist in
the disease, was chosen president of the new orgamization, which will be a subdivision of the

American Diabetes Association
Purposes of the association include education of
the public to the importance of early recognition of
the disease, obtaining medical supervision, and
dissemination among physicians of information
relative to diagnosis and treatment of diabetes

The organization will encourage and support clinical, experimental, sociologic and statistical studies of diabetes, and will compile and publish statistical surveys on diabetes. It also will work toward establishment of summer camps for diabetic children

Dr Gibbs, president of the new association, organized the first diabetic clinic at Rochester General Hospital in 1925 and served as its head for twenty years. At present he heads the diabetic clinic at Strong Memorial Hospital and is consultant

ANGINA PECTORIS

and other
Manifestations of
CORONARY
INSUFFICIENCY

The following episodes may be prevented by appropriately regulated administration of a vasodilator laving a sustained effects:

FOR THE PERSON

- who is compelled to step and rest schen climbing a flight of stairs.
- who suffers "ladigestion" and "gas" on exertion, or after a heavy meal.
- who is stricken with precordial pain on unusual exertion or emetion, or when exposed to cold.

The vacodilatation preduced by Ery throl Tetranitrate Merck begins 15 to 20 minutes after administration, and lasts from 3 to 4 bours.

It is generally agreed that the acute attack of anginal pain is most readily relieved by the prompt removal of the proceeding factor and by the use of nitrites. For prophylactic purposes—to control anticipated purposysms—the delayed but prolonged action of crythrol tetrantimuse is effective. Erythrol tetrantimute, because of its shorter and more prolonged action, is also considered preferable for the purpose of preventing measural attacks.

Announcement of a six-months affiliation of the White Plains Hospital School of Nursing with Presbyterian Hospital-Columbia University, in pediatric nursing at the Babies' Hospital and in orthopedic nursing at New York Orthopedic Hospital, New York City, has been made by William G Illinger, hospital administrator Beginning May 15, 1947, Mr Illinger said students were sent to Presbyterian Hospital for these clinical experiences

With (1) the nursing course now lengthened to three full years, (2) basic sciences taught at the University of Connecticut, (3) the continued affiliation of three months in psychiatry at New York Hospital

—Cornell University (Westchester Divison), and
(4) the lately made affiliation of six months with

Presbyterian Hospital—Columbia University, Mr Illinger summarized that the White Plains Hospital School of Nursing now offers its students a far greater breadth of education and of superior quality than heretofore *

Patients totaling 2,036, including 853 men and 1,183 women, 315 more than its certified capacity allows, were under treatment at St Lawrence State Hospital in Ogdensburg, at the end of March, Dr J A Pritchard, senior director, has reported to the Board of Visitors *

Vassar Brothers Hospital, Poughkeepsie, plans to start a course of instruction for hospital aides Young women between the ages of 18 and 40, who have completed eighth grade schooling and who can satisfactorily pass a physical examination, will be eligible

Miss Mary Louise Fernald, Director of Nursing at the Hospital, intends to include the following in the training course a short course in hospital ethics, personal hygiene, physiology, demonstrations of practical procedures, fixing trays and

serving food *

At a board meeting of the Chase Memorial Hospital of New Berlin, it was decided to set aside certain days for the examination, diagnosis, and treatment of patients who desire this service

The Board has arranged for Dr Barnard Wells of Utica to set up this service and receive patients each day, except Sunday, at the hours of 9 AM to 11

All patients who desire this service will be given a thorough examination, diagnosis, and recommendation for treatment at fees that will be commensurate with the trend of the times *

Establishment of a prenatal clinic at Glens Falls Hospital, Glens Falls, has been authorized by the board of directors Opening of the clinic will mark a new field of activity for the hospital, which has never before undertaken clinical service. The clinic will be conducted every two weeks, with members of the obstetrical staff in charge

Immediate modernization of facilities at Troy Hospital and erection of a new nurses' residence to meet the constantly increasing demands for hospital service in Troy and the immediate vicinity, has been announced by Sister Angela, superintendent of the Hospital

A survey recently completed by the Joint Hospital Board, New York State Postwar Public Works Planning Commission, disclosed that Troy and Rensselaer counties have hospitals designed to accommodate 622 patients. The survey recommended that 722 hospital beds be made available to meet community hospitalization needs '

Operating costs of the Jewish Memorial Hospital at Broadway and 196th Street in 1946 were \$756,-878, it has been announced by Milton M Goldsmith, the president The 1946 deficit was \$90,432 Last year the hospital admitted 7,556 patients, who received 58,948 days' care Visits to the outpatient department numbered 19,957

The social service department served 1,679 patients and their families Recently the hospital opened a psychiatric clinic in the outpatient department *

The New York Hospital celebrated the 176th anniversary of its founding on May 14 with a ceremony in the lounge of the Nurses' Residence The hospital is the oldest in the city

The ceremony was conducted by the Society of the New York Hospital, with John Hay Whitney, vice-president of the society, president of the society, William Harding Jackson, president of the society, and Dr Edmund Ezra Day, president of Cornell University *

The goal of \$3,000,000 sought for the Alfred E Smith Memorial Hospital in New York City has been reached it has been made known by Cardinal Spellman, head of the Alfred E Smith Memorial Foundation

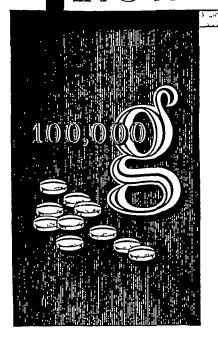

The hospital is to be an annex to St Vincent's Hospital, Seventh Avenue and Thirteenth Street, of which the former governor of New York was a

trustee and director for thirty years."

The board of trustees of the Hudson City Hospital is planning the establishment of a tumor clinic, which will include clinical and laboratory diagnosis and treatment. With the approval of the Columbia County Medical Society, a cancer detection clinicalso will be established for the benefit of all persons. in the county *

New

crystalline penicillin G in a 100,000 unit segmented tablet

Here is new convenience and economy in oral penicillin therapy Bristol has provided a 100,000 unit segmented tablet, formulated of Crystalline Sodium Penicillin G, and adequately buffered against gastric acidity Extra potency is available where required, yet the scoring permits easy separation for lighter dosage Available in bottles of twelve tablets from your usual source of supply

The penicillin contained in the new Bristol 100 000 unt tablet fully meets official specifications for Crystalline Sodium Penicillin G Therapeutically tlus form of the antibiotic is highly effective Inert materials have been virtually eliminated No refrigeration is required.

REVIEWED

Modern Drug Encyclopedia and Therapeutic Index. Edited by Alexander B Gutman, M D Third edition Octavo of 1,157 pages, illustrated New York, Yorke Publishing Co, 1946 Cloth,

In this volume, including over a thousand pages, are listed all of the drugs, etc , commercially available in this country The items are conveniently listed in three sections devoted to pharmaceuticals, biologicals, and allergens There are appended a therapeutic index, a manufacturers' and distributers'

index, and a glossary

Under the able editorship of A B Gutman, the son of the original author who has died since the appearance of the second edition, the book has been completely rewritten and obsolete preparations deleted As usual, supplementary pamphlets will be issued by the publisher

This Encyclopedia will be of some value to those practicing physicians who already know and use New and Nonofficial Remedies

MILTON PLOTZ

Psychological Medicine A Short Introduction to Psychiatry With an Appendix on Psychiatry Associated with War Conditions By Desmond Curran, MB (Eng), and Eric Guttmann, MD Octavo of 246 pages, illustrated Baltimore, Wil-Baltimore, Williams & Wilkins Company, 1945 Cloth, \$3 50

As a short introduction to psychiatry this book is eminently successful in that it simply and succinctly

discusses the neuroses and the psychoses

The student is not lost in a maze of psychopathologic theory The authors rather emphasize the multiple causation of mental disorder logic, physical, and constitutional factors as well as the social milieu are evaluated They remind us that "psychiatry cannot be sharply differentiated from general medicine A sound knowledge of medicine is therefore essential for psychiatric study and practise"

ARTHUR J LAPOVSKY

Disorders of the Blood Diagnosis, Pathology, Treatment and Technique By Sir Lionel E H Whitby, M D, and C J C Britton, M D edition Octavo of 665 pages, illustrated Fifth Philadelphia, Blakiston Company, 1946 Cloth, \$10

This book on hematology is one of the leading works on the subject. In this fifth edition the authors have maintained their usual excellent standards, have enlarged the book and have included such new and important developments as the origin and development of blood cells, hemolytic anemias, anemias of infancy and childhood, and the Rhesus The illustrations and tabular mablood factors terial are clear and instructive, and the bibliographies are adequate Unfortunately, in the section on the Rhesus factors, three different nomenclatures are used, with confusion similar to that caused by the use of the Moss and Jansky nomenclatures for the four Landsteiner blood groups It is hoped that in the next edition this will be corrected, be-cause the original nomenclature of the Rh-Hr types is simple, unambiguous, and comprehensive, so that there is no need for more than a single nomenclature

A S WIENER

Technique in Trauma Planned Timing in the Treatment of Wounds Including Burns From the Montreal General Hospital and McGill University By Fraser B Gurd, M D, and F Douglas Ackman, M D Octavo of 68 pages, illustrated Philadelphia. J B Lippincott. 1944 Cloth. 82 00 phia, J B Lippincott, 1944 Cloth, \$2 00

This book of 68 pages deals with the planned timing in the treatment of wounds, including burns The text is about equally divided between these

tn o subjects

Briefly, the use of congulating chemicals on burns is not recommended notwithstanding that credit is given to Davidson, who introduced the tannic acid method of treating burns in 1925

In general, the authors recommend the careful and atraumatic cleansing of the burned area with the application of a nonadherent compression dressing, and then advise careful attention directed toward meeting the requirements of an altered physiologic equilibrium

Similar fundamental principles are recommended in the care of wounds. The authors feel that physiologic and anatomic rest, the prevention or limitation of bacterial contamination, proper dressing, and adequate surgical treatment are of more importance than the application of bacteriocidal agents

Several excellent colored plates have been inserted, and innumerable case reports illustrating the text, taken from the Montreal General Hospital, are found throughout the book

MERRILL N FOOTE

Familial Nonreaginic Food-Allergy By Arthur F Coca, M D Second edition Octavo of 191 pages, illustrated Springfield, Ill, Charles C Thomas, 1945 Cloth, \$3.75

The writer of this book presents additional studies leading to the separation of a group of allergic diseases designated as idioblapsis (familial nonreaginic food allergy) An increase in the pulse rate of 20 or more, together with a high maximal pulse (88 or more) is offered as a reliable criterion for identification of the offending food causing the idioblaptic reaction. In addition to various clinical manifestations previously described, the author reports studies indicating a close relationship between dementia praccox, malignant growth of the breast, epilepsy, and essential hypertension with the idioblaptic phenomenon

The point of view presented in this book should be of interest to both the allergist and the internist The subject needs further study by other workers

MAX HARTEN

Voluntary Health Agencies An Interpretive Study By Selskar M Gunn and Philip S Platt. Under the auspices of the National Health Council Octavo of 364 pages New York, Ronald Press Co, 1945 Cloth, \$300 The medical profession has participated in the Voluntary health agency movement in the United

voluntary health agency movement in the United States, and should be interested in this study of the

now over 20,000 such agencies

As the medical profession takes the more active part which it should assume, it is essential that it participate in the, to use the authors' words, "revitalizing of local voluntary health agencies

Modern trends toward consolidation may conceivably produce supercolossal, dehumanized health Coordination is essential, and this volume gives the background for the thinking physician who is actively participating in the health movement of his community at, to use the modern language, the local level If he does not know the national, state, and even international complications of health promotion, his advice and guidance at the so-called local level may be unsound This book will help him in his orientation

ALEC N THOMSON

Under the Penicillin Its Practical Application general editorship of Sir Alexander Fleming, M B Philadelphia, Octavo of 380 pages, illustrated Blakiston Company, 1946 Cloth, \$7 00

This book by Sir Alexander Fleming and his coauthors is a timely presentation of penicillin therapy as it exists today. It is reasonable to assume that some of its content will be outdated in the not too distant future

In a most delightful introductory chapter, Fleming traces the history and development of penicillin He points out that penicillin was the first agent ever encountered which destroyed bacteria without ap-

parent injury to leukocytes

The clinical application of penicillin is claborately discussed in the various specialties and conditions such as war wounds, gas gangrene, chest surgery, orthopedics, fractures, venereal diseases, etc ever, there is a paucity of information regarding antibiotic therapy of the ambulatory patient such as would be of interest to the general practitioner

On the whole, the book is well illustrated and contains a wealth of material which is excellently pre-It belongs on the bookshelf of every physi-

cian and scientist

LEO LOEME

Everyday Psychiatry Concise, Clinical, Practi-l By Comdr John D Campbell, (MC), USNR Octavo of 333 pages Philadelphia, J B Lippin-Cloth, \$6 00

Dr Campbell, drawing largely on his experience with military personnel, has written a textbook which covers in clear fashion many of the common psychiatric problems encountered by the general practitioner He covers intelligence and mental deficiency, psychopathic personalities, and the psychoneurotic reactions. He is inclined to emphasize constitutional and hereditary factors in the genesis of clinical entities usually considered psychogenic and, with some pertinence, cites Ives Hendricks' remarks on the etiology of paranoid Dr Campbell incorporates some dissymptoms cussion of the problem of compensation for psychoneurotic veterans and discusses the difficulties involved in the rehabilitation of returning service men

EDWARD F FALSEY

The Autonomic Nervous System By Albert Third edition Octavo of 687 pages, Kuntz, M D Philadelphia, Lea & Febiger, 1945 illustrated Cloth, \$8 50

This book has become a classic in American medical teaching, as well as in neurologic reference The present edition is the third, and is greatly revised, bringing the morphologic and physiologic basis of modern drug dynamics, as well as psychosomatic medicine, up to date The tremendous bibliography, which is a classic in itself, is amplified by a fine text, making the book practically encyclopedic in its field

SAM PARKER

Medical Biochemistry By Mark R Everett, a D. Second edition Octavo of 767 pages, illus-New York, Paul B Hoeber, Inc. 1946 trated

Cloth, \$7 00

The second edition of this textbook of biochemistry reflects the marked advances in this subject in the past decade This text presents its material from the biochemical viewpoint. Each subject is covered briefly giving first the chemical background and then the physiologic and medical implications. The coverage of material is encyclopedic in scope, making the book a good reference source for physicians interested in catching up with the vast amount of new material uncovered in recent years in carbohydrate, protein, and fat metabolism as well as enzymology, endocrinology, bacteriology, vitamin studies, etc. Explanations are scanty, but refer-ences are well chosen and will assist in easily finding more detailed knowledge when necessary

MILTON B HANDELSMAN

Proceedings Conference on Diagnosis in Sterility Sponsored by the National Committee on Maternal Health January 26-27, 1945, New York City Edited by Earl T Engle, Ph D Octavo of 237 pages, illustrated Springfield, Illinois, Charles C Thomas, 1946 Cloth, \$500 All of the papers are by well-known authorities

in their respective fields and their discussions bring out many and divergent opinions by members of the

conference

Of particular interest is Summary of the Conference by Dr John Rock, who epitomizes the raison d'être for such a volume, "this subject is really one for specialists and an untrained general practitioner ought not to interfere. Infertility is much too detailed a subject for casual or routine It is true that patients are sometimes terribly manhandled by the first doctor to whom they go, but we, too, must be very careful not to lead ourselves or patients astray on futile examina-

Therapy of infertility is not evaluated work is recommended as a worthwhile reference to those interested in the problem of human infertility

SAMUEL L SIEGLER

The American Hospital By E H L Corwin, PhD Octavo of 226 pages New York, Commonwealth Fund, 1946 Cloth, \$1 50

This book deals with the history and develop-

ment of the American hospital

Aside from the statistical tables, it gives factual information and many references which can be used if one wishes to go to the original source of the information

The book is especially recommended to students of hospital administration, not only for its factual information, but it will give him the background which is essential for understanding modern trends

The chapter on retrospect and prospect is thoughtprovoking and can be read not only by administrators and trustees, but by heads of clinical departments who have any administrative responsibility

___ \$794607

- COLA Y REVLE

[Continued from page 1428]

By Gordon Introduction to Clinical Neurology Holmes, M D Octavo of 183 pages, illustrated Baltimore, Williams & Wilkins Company, 1946 Cloth, \$4 00

In this volume of 183 pages an eminent neurologist has presented a lucid description and interpretation of the manifestations of neurologic disorders

Complex terminology and confusing diagrams are conspicuous by their absence Nevertheless, accuracy and thoroughness are nowhere sacrificed The eighteen chapters cover the entire field including such phases as speech disorders, agnosia, apraxia, autonomic system, and methods of examination

This book is highly recommended to all physicians and students who come in contact with patients presenting neurologic problems. It can be considered an excellent clinical guide as well as an intro-

duction to neurology

ARTHUR J LAIOVSKY

Narcotics and Drug Addiction By Erich Hesse, Translated by Frank Gaynor Octavo of the New York, Philosophical Library, 1946 MDOctavo of 219 pages Cloth, \$3 75

The author, a professor of pharmacology and biology, states that nature offers a lavish supply of the substances which enable man to experience all stages of well-feeling and that a not inconsiderable percentage of mankind suffers temporary or lasting injuries to health from their overindulgence

In reference to tobacco, he objects to the claim of certain representatives of the tobacco industry that tobacco smoking is actually beneficial to health, on the ground that it is a serious misrepresentation As to coffee, he feels that physicians will recommend caffeine-free coffee in many instances It is the contention of the author that, conceding the harmfulness of narcotics and stimulants, the physician alone is unable to make them harmless, it is up to the lawmaker to come to his aid

JOSEPH RAPHAEL

Manual of Nursing Procedures, the Mount Sinai Hospital, New York City Prepared by the Faculty of the Mount Sinai Hospital School of Nursing, Grace A Warman, MA, Principal Quarto of 313 pages, illustrated New York, Mount Sinai Hospital Press, 1946

The collaboration of doctors and nurses in the preparation of this book has led to a nell-organized, specific account of nursing care preferred by the Mount Sinai Hospital staff

The binding is good, the printing is well done, the important parts are in heavy print or italics.

The illustrations are good, but there could be

The procedures can be followed readily and should be of great value to new employees on the hospital staff

MARIE M BEHLEN

Die Grundlagen Unserer Ernährung und Unseres By Professor Emil Abderhalden Duodecimo of 202 pages Bern, Fifth edition Bern, Switzerland, Medizinischer Verlag Hans Huber, Paper, 8 50 Sw fr 1946

The book is a good introduction to the physiology of our metabolism and fundamental foodstuffs

The author criticizes the tendency to schematize too much and to attach (quickly) a name to not yet properly understood biologic occurrences He feels that a name is often only a pretense for imperfect knowledge Overanxiety in many people to do something special for their health often produces the opposite effect Suggestions in this direction are given in the final chapter Although there is nothing new in it, the book is to be recommended because it is well-written and easy to understand

MAX G BERLINER

Allergy By I Gottlieb, M D By Erich Urbach, M D, and Philip M Second edition Quarto of 968 pages, illustrated New York, Grune & Stratton, Cloth, \$12 1946

This second edition, with considerable new material, represents much labor However, it exhibits the same faults as the first edition, namely in presenting much controversial material, which only confuses the general reader Much of the therapy is outmoded and some of the concepts have never been accepted by a majority of allergists. The bibliography is large and the text presents the subject in a complete and scholarly fashion. It will be read with interest by many allergists, but cannot be recommended as a text for the general practitioner

G A MERRILL

Oral Diagnosis and Treatment. A Textbook for Students and Practitioners of Dentistry and Medicine By Samuel Charles Miller, D D S Second edition Octavo of 905 pages, illustrated Philadelphia, Blakiston Company, 1946 Cloth, \$10

Dr Miller and his collaborators have been entirely successful in producing a first rate book on diseases of the mouth There are 574 black and white illustrations and 39 color plates, all of them clear and to the point

Much of the book, especially those sections dealing with treatment, will be read with profit mostly by dentists Dr Miller would help his medical colleagues by publishing a cheaper and abbreviated manual covering only the field of diagnosis. In any case, this volume is heartly recommended to everyone interested in diseases of the oral cavity

MILTON PLOTZ

The Treatment of Bronchial Asthma By Vincent Derbes, MD, and Hugo Tristram Engelhardt, M D, with chapters by a panel of contributors Octavo of 466 pages, illustrated Philadelphia, J B Lippincott, 1946 Cloth, \$8

In this new book, Derbes and Engelhardt have attempted to present a comprehensive, well-rounded picture of bronchial asthma in all its aspects

Better than average coverage is given psychogenic factors, cardiac asthma, surgery in bronchial asthma, and the chapter on vital statistics is handled in an unusual fashion

Many of the chapters are written by eminent authorities in other fields who have looked at asthma in reference to their own experience and specialty

This is a concise and up-to-date book, to be recommended particularly to the general practitioner because it is not verbose, encyclopedic, or technical

in Polson DERMATITIS

The termenting itch of Rhes dermetitis has few equals in routine medkal practice. Many patients receive early welcome relief after injections of POISON IVY EXTRACT Arillegton.

POISON IVY EXTRACT Artington is an absolute alcohol extract of Rhus leaves of established potency. The use of absolute alcohol results in an extract of greater dependability Use as supplied for diagnostic patch test and for treatment of poison by dermetitis.

Clinical evidence indicates that a single excitant is responsible for dermatitis due to pelson by pelson oak, and pelson semec. Thus, this extract is equally applicable to dermathis coused by contact with any of these plents.

DOSAGE: As seen as pessible after appearance of symptoms, three subcutameous injections of 0.1 cc. each are given at daily intervals.

POISON IUV EXTRACT

SUPPLIED in rubber-steppered vials containing 3 cc.

THE ARLINGTON CHEMICAL COMPANY YONKERS !

SOPROMOL

for Dermatophytosis

EFFECTIVE—Sopronol is fungistatic and fungicidal A preparation of propionate and propionic acid, it combats invading fungi powerfully, yet mildly Sopronol, the modern fatty acid treatment, meets requirements for the management of superficial fungous infections of the feet and hands

POWER OF MILDNESS—Sopronol has the power of mildness—virtually nonirritating and nonsensitizing. The active principle of Sopronol is propionic acid—a component of human sweat, and a natural physiological defense against invasive organisms.

CLINICAL USE—Sopronol gives excellent results in tinea pedis It does not cause "id" reactions (due to absorption of mycotic debris), which are likely to occur through use of agents with more violent action

Sopronol solution and ointment contain sodium propionate 16 4%, propionic acid 3 6% Powder contains calcium propionate 15%, zinc propionate 5%

Sopronol is supplied in 3 forms—

POWDER

2 oz. canister
